E

EADIE—EAGLE PASS.

EADIE, JOHN, a learned Scotch divine, was born at Alva, in Stirlingshire, 9th May, 1810. He studied at the university of Glasgow, and was licensed in 1835 as a preacher of the United Secession Church, in which, soon after, he became minister of a Glasgow congregation—a post he retained after its union with the Relief Church (1847) as the United Presbyterian Church. From 1848 to the close of his life he also lectured on the exegesis of Scripture in the theological college of his church. He received the degree of LL.D. from Glasgow in 1844, and of D.D. from St. Andrews in 1850; was moderator of the synod of his church in 1857, and was one of the original members of the New Testament Revision Company. He died 3d June, 1876. Eadie maintained throughout life an incessant literary activity. If not an exegete of the highest order, he possessed wide learning and great power of exposition. Few books are more generally useful and more intelligible to the non-theological reader than his *Biblical Cyclopædia* (1848), and his *Ecclesiastical Encyclopædia* (1861). Sound contributions to New Testament exegesis were his commentaries on St. Paul's epistles to the Ephesians (1854), Colossians (1856), Philippians (1857), Galatians (1869), and Thessalonians (posthumously, 1877). His latest work was *The English Bible* (2 vols. 1876), a learned and yet popular history of the English translations of the Scripture. See his *Life* by Dr. James Brown (1878).

EADS, JAMES BUCHANAN (1820-87), an American engineer. At the age of 13 he settled in St. Louis, and in 1842 constructed a diving-bell boat. Afterwards he built several boats for raising large steamers. In 1845 he established the first glass-works west of the Mississippi. In 1861 he constructed eight iron-clads in 100 days, and these steamers were employed in the capture of Fort Henry in February, 1862. Later he built many other iron-clads and mortar boats. For seven years from 1867 he was engaged in the construction of the steel arch bridge across the Mississippi River at St. Louis. Subsequently he deepened the Southern Pass at the mouth of the Mississippi by means of jetties, and outlined a plan to deepen the river from the Gulf of Mexico to the mouth of the Ohio. Congress appropriated a large sum of money for the work, but discontinued the appropriation after the plan had been shown to be practicable. He afterwards formed a company to build a ship railway across the Isthmus of Tehuantepec. He was connected with various other enterprises.

EAGLE, a gold coin of the United States of America, of the value of ten dollars.

EAGLE, used heraldically, is an emblem of magnanimity and fortitude. It is variously represented, the best known mode being displayed, or spread out, either with two heads—as in the arms of the German Empire, in which case it is popularly known as a spread eagle—or with one head, as in the arms of the kingdom of Prussia.

EAGLE, as a military standard, adopted by the Romans, and even by nations preceding them in history. The Persians, in the time of Cyrus the Younger, bore an eagle on a spear of a standard. The Roman eagle, sometimes of gold, but more frequently of silver, was about as large as a pigeon with extended wings, and was borne on the top of a spear, with a cross-bar or shield to support it. In modern times, France, Russia, Prussia, Austria and the United States have all adopted the eagle as a national military symbol.

EAGLE, BLACK, ORDER OF THE: in Prussia, an order founded by the Elector of Brandenburg, on Jan. 17, 1701, the day of his coronation as king of Prussia. The number of knights, in addition to the princes of the royal family, was originally 80, but is now unlimited. They must at their nomination be at least 30 years of age, and their noble descent for four generations is necessary. The insignia of the order consists of an octagonal cross of blue enamel, and eight black eagles displayed between the arms of the cross. The cross is suspended by a broad ribbon of orange color across the left shoulder, and it is accompanied by an embroidered silver star, fastened on the left breast. Knights of the Black Eagle are likewise knights of the Red Eagle, first-class.

EAGLE-HAWK (*Morphus*, or *Spizætus*), a genus or sub-genus of *Falconide*, of the eagle group, but consisting of species of comparatively small size, and characterized by short wings, long, slender legs (*tarsi*), and comparatively feeble toes and claws. They are natives of warm climates, chiefly of South America, but also of Africa and the East Indies.

EAGLE-OWL (*Bubo*), a genus of the owl family (*Strigide*), characterized by a somewhat incomplete facial disc, two tufts of feathers (*horns* or *egrets*) of considerable size on the head, ears with small openings (*conchs*), legs and toes covered with feathers, short, strong curved bill, and long curved sharp claws (see *Britannica*, Vol. XVIII, p. 90). To this genus belong the largest of the nocturnal birds of prey. The eagle owl of Europe (*Bubo maximus*) is little inferior in size to the golden eagle, and preys on quadrupeds such as hares, rabbits, and young deer, and on grouse, partridges and other kinds of game. It seizes its prey with its feet, and seldom touches it with the bill till its struggles are over. It is an inhabitant of many parts of Europe and Asia, but it is only an occasional visitor in Britain. The eagle owl of America (*B. Virginianus*), the Virginian horned owl, or great horned owl, is very similar to the species just noticed, but of inferior size, although still a large and powerful, as it is also a bold, bird. It carries off with ease almost any inhabitant of the poultry yard. It is found in almost all parts of America.

EAGLE PASS, the county-seat of Maverick county, Texas, on the Rio Grande River, 248 miles southwest of Austin. Population (1890), 3,000.

EAGLE, RED, ORDER OF THE, in Prussia, founded in 1734 by the Markgraf George Frederick Charles. After passing through various modifications, the order was raised in 1791 by Frederick William II. to the rank of the second order in the monarchy, and the decoration of a white enameled Maltese cross, surmounted by a royal crown, with the Brandenburg eagle in the corner, was adopted.

EAGLE ROCK, a village of Bingham county, Idaho, on the Snake River. It is the market place for a large part of Snake River valley.

EAKINS, THOMAS, artist, born in Philadelphia, July 25, 1844; studied in Paris under Gérôme and Bonnat. He has exhibited in Paris and in this country, and is connected with the Art Students' League of Philadelphia.

EARLE, PLINY, born in Leicester, Mass., Dec. 31, 1809. He was physician at Bloomingdale Asylum 1844-49, and superintendent of the State hospital for the insane at Northampton, Mass., for more than 20 years. He was a prominent member of the American Medical Association, the New York Academy of Medicine, and other societies, and has been a frequent contributor to medical journals.

EARLY, JOHN, born in Virginia, Jan. 1, 1786; died Nov. 5, 1873. He became an itinerant Methodist preacher in 1807. In 1854 he was elected bishop and held that office until his death. He was one of the founders of Randolph-Macon College.

EAR: in music, a figurative expression, meaning the possession of a sensitive, just, and delicate appreciation of sound and measure.

EARLVILLE, a village of La Salle county, Ill., 74 miles southwest of Chicago. The place has manufactories and a steam mill.

EARLY ENGLISH: in architecture, the term generally applied to the form of Gothic in which the pointed arch was first employed in England. The early English succeeded the Norman towards the end of the 12th century, and merged into the Decorated at the end of the 13th. Its characteristics are peculiar. Retaining much of the strength and solidity of the earlier style, it exhibited the graceful forms, without the redundancy of ornament which latterly degenerated into a fault in that which followed.

EARLY, JUBAL ANDERSON, an American soldier, born in 1816. He served in the Florida war in 1837-38, and then began the practice of law in Virginia. He was a member of the legislature in 1841-42, and Commonwealth attorney from 1842 to 1847, and again from 1848 to 1852. He served in the Mexican war, and in 1847 was acting governor of Monterey. At the beginning of the civil war he entered the Confederate army as a colonel, and later became brigadier-general. After the war he visited Europe, and later resumed his law practice in the South.

EARNEST, or ARLES, as it is called in Scotland, a small sum of money which is given, or a simple ceremony, such as shaking hands, which is performed in proof of the existence of that mutual consent which constitutes a contract. In the first case the earnest is said to be pecuniary; in the second, symbolical. It is not the earnest but the consent, the agreement to a certain price; that is the root of the bargain; and the earnest thus becomes a mere adminicle of evidence, which may be dispensed with even in cases in which it is exacted by custom, if the parties choose to preserve other evidence of the completion of their bargain.

EARS, a term in organ building given to small projecting pieces of metal on the sides of the mouths of metal pipes, put on for the purpose of assisting the pipes to speak promptly, especially when the organ is of small scale.

EARTH ALMOND, or CHUFA, a species of sedge, *Cyperus esculentus*, whose tuberous roots are used in the South of Europe as a vegetable and in making a popular drink called *orchatas de chufas*. It has been successfully grown in the warmer parts of the United States, and has been recommended as a substitute for coffee.

EARTH-HOUSES, EIRD-HOUSES, or YIRD-HOUSES, the name which seems to have been generally given throughout Scotland to the underground buildings, which in some places are called also "Picts' Houses," and in others, it would appear, "weems," or caves. The earth-house, in its simplest form, is a single irregularly shaped chamber, from 4 to ten feet in width, from 20 to 60 feet in length, and from 4 to 7 feet in height, built of unhewn and uncemented stones, roofed by unhewn flags, and entered from near the top by a rude doorway, so low and narrow that only one man can slide down through it at a time.

EARTHS: in chemistry, a class of substances which were regarded by the alchemists and older chemists as elementary, and which are insoluble in water. The earths *proper* are now known to be compound, consisting of a metal in combination with oxygen. The list includes alumina, glucina, zirconia, thoria, didymia, lantana, ceria, yttria, terbia, and erbia. They do not alter vegetable colors, are soluble in acids, and are precipitated from their solutions by ammonia, potash, or soda.

EARTHWORM (*Lumbricus*), a genus of *Annelida*, of the order *Terricola*. There are many species, all of them pretty closely resembling in characters and habits the common earthworm or dew-worm (*L. terrestris*). See *Britannica*, Vol. XXIV, p. 677. It has no head distinct from the body, no eyes, no antennae, nor any organs external to the rings of which its body is composed, except minute bristles pointing backwards, of which each ring bears four pairs, and which are of use in its locomotion. It sometimes attains to nearly a foot in length, and more than 120 rings have been counted in its body. The end at which the mouth is situated is pointed and the tail is flattened, while the general form is cylindrical. The mouth consists merely of two lips, the upper lip elongated; there are no teeth nor tentacles, and the worm subsists by swallowing fine particles of the soil, from which its digestive organs extract the digestible matter, the rest being voided often in little intestine-shaped heaps, called *worm-casts*, on the surface of the ground. The locomotion of the earthworm is effected by means of two sets of muscles, which enable it to contract and dilate its rings; its bristles preventing motion backwards, and the whole muscular effort thus resulting in progress, while the expansion of the rings, as it contracts the anterior segments, and draws forward the hinder parts, widens a passage for it through earth whose particles were close together before. Earthworms are thus of very great use, their multitudes continually stirring and loosening the soil through which they work their way; and moles, pursuing them for food, stir and loosen it still more; while worm-casts gradually accumulate on the surface to form a layer of the very finest soil, to which it is supposed that the best old pastures in a great measure owe their high value.

EAR TRUMPET, a contrivance for improving the hearing of the partially deaf. The principle in them all is the same—to collect the sonorous vibrations, and to convey them in an intensified form to the deeper part of the ear. In this way, the hand, placed behind the external ear, constitutes the simplest form of ear-trumpet. There are many varieties of trumpet in use. The most useful and comfortable are those which are worn on the head,

and which go by the name of ear-cornets or acoustic auricles. They can be concealed under the hair or cap, and may be adapted to one or both ears by means of a spring over the head. The apparatus most commonly in use requires to be held in the hand, and consists of a narrow portion which is inserted into the ear-passage, and which gradually expands into a wide mouth. Another variety, applicable to the more severe cases of deafness, consists of an elastic tube, one end of which is tipped with ivory, and is placed in the ear of the patient; the other is held in the hand of the speaker, who applies his mouth to the open extremity. With this instrument only one voice can be heard at a time. With the first-mentioned variety, general conversation can be heard often quite well.

EASDALE, a small Scottish isle on the west coast of Argyllshire, in the Firth of Lorn, ten miles south-southwest of Oban. It contains one and a half square miles, and is situated in Kilbrandon parish.

EAST: vaguely speaking, that quarter of the horizon where the sun rises, or which a person with his face to the south has on his left hand. It is only at the equinoxes that the sun rises exactly in the east point. A line at right angles to the meridian of a place points exactly east and west.

EAST AURORA, a village of Erie county, N. Y., situated in a rich farming section. It is 17 miles southeast of Buffalo. Population (1890), 1,582.

EAST BRADY, a village of Clarion county, Pa., on the Alleghany River, 70 miles north of Pittsburgh. The Brady iron works are just across the river, and furnish employment to 1,500 persons. This village is near the Butler county oil regions, and considerable oil is brought in pipe lines to the village, and then shipped. Population (1890), 1,228.

EAST BRIDGEWATER, a post-township of Plymouth county, Mass., 25 miles southeast of Boston. It has excellent water-power, and is a thriving manufacturing place. Among the articles made here are brick, cotton-gins, iron, chains, nails, boots and shoes. Population (1890), 2,911.

EASTBURN, MANTON (1801-72), an American P. E. bishop. He was ordained in 1822, and for the succeeding five years was assistant minister in Christ Church, New York. In 1827 he became rector of the Church of the Ascension. In December, 1842, he was consecrated assistant bishop of the diocese of Massachusetts, and two months later became bishop. He published several works on religious topics.

EAST CAPE, the name of the most easterly headlands of the island of Madagascar, of the North Island of New Zealand, and of Siberia or Asiatic Russia. The *first* is in lat. 15° 20' S., and long. 50° 15' E.; the *second* in lat. 37° 40' S., and long. 178° 40' E., being almost precisely the antipodes of Carthage in Spain; and the *third* is that extremity of the Old World which is nearest to the New, being separated by Bering's Strait from Cape Prince of Wales in America. It is in lat. 60° 6' N., and long. 169° 38' W.; or rather, to follow the natural reckoning, 190° 22' E.

EASTMAN, JOHN ROBE, born in Andover, N. H., July 29, 1836; graduated at Dartmouth in 1862. He became professor of mathematics in the United States navy, and is a Fellow of the American Association for the Advancement of Science, and a member of many scientific societies. He is best known in connection with astronomical research.

EASTER, the passover, the festival of the resurrection of Jesus Christ. The proper time for the celebration of Easter has occasioned no little controversy. The Eastern Christians celebrated Easter on the 14th day of the first Jewish month or

moon, as being equivalent to the Jewish passover. The Western churches celebrated it on the Sunday after the fourteenth day, holding that it was the commemoration of the resurrection of Jesus. The Council of Nice (325 A. D.) decided in favor of the Western usage, branding the Eastern usage with the name of the "quartodeciman" heresy. The time of Easter, being the most ancient and important of all the movable feasts of the Christian Church, determines all the rest. It must fall between March 22 and April 25.

EAST HADDAM, a township of Middlesex county, Conn., on the Connecticut River. It contains a music-seminary, three, Britannia shops, and thirteen cotton-mills. Population (1890), 2,599.

EAST HAMPTON, a manufacturing town and railroad junction of Hampshire county, Mass., five miles southwest of Northampton. The place contains Williston Seminary for young men, and a public library, and has manufactories of pumps, vulcanized rubber, suspenders, thread and buttons.

EAST HUMBOLDT MOUNTAINS, a high range of mountains in Elko county, Nev., extending north and south. Ruby Valley is on the east and Hunt-ington Valley on the west, while Secret Valley and Fremont Pass cut the range, some of whose peaks exceed 12,000 feet in height.

EAST INDIA ARMY. When the East India Company first sent factors or agents to India, an army was not thought of. Military forces arose out of the exigencies of the times. Some of the first troops in the Company's pay were mere adventurers, some were liberated convicts, some deserters from European armies. Gradually organization was introduced and improved arms furnished. As the power of the Company increased, natives entered the battalions, until at length most of the troops were Hindoos or Mohammedans, drilled by non-commissioned officers sent out from England. A few regiments were raised in India; but all alike were officered by the Company's favored English officers. The ranks were filled by enlistment; the Company never compelled the natives to become soldiers; the pay offered was always such as to induce a sufficient number of men to enter. Their periods of leave of absence were liberal; and after a certain number of years' service they retired on a pension sufficient to support them for the remainder of their days. At the period immediately preceding the outbreak of the revolt in 1857, the army in the pay of the Company comprised about 24,000 royal troops (lent to, and paid for by, the Company); 18,000 European troops, raised and drilled by the Company in England; 180,000 native regulars, and 60,000 native irregular horse—making about 280,000 in all. This large force was irrespective of 40,000 contingents furnished by dependent native princes, and of the native armies belonging to the independent and semi-independent princes. In August, 1858, the act which transferred the government of India from the Company to the crown received the royal assent, and the army was transferred as well as the political power.

EAST LIVERPOOL, a city of Ohio, near the eastern boundary of the State, on the Ohio River, and in Columbiana county. It is on the Cleveland and Pittsburgh railroad, 24 miles above Steubenville, and 44 miles west-northwest of Pittsburgh, Pa. Its chief industry is the manufacture of stoneware, earthenware, terra-cotta, graniteware and yellowware. Population in 1880, 5,568; in 1890, 10,947.

EAST MAIN, formerly a portion of the Hudson Bay territories, now incorporated in the Dominion of Canada. It is bounded north by Hudson Strait and west by Hudson Bay down to its southern extremity, meeting Labrador on the east and Canada on

the south. This immense region, thrice as large as Great Britain, is generally bleak and sterile, yielding little to commerce but fish-oil and a few furs. A river of the same name, otherwise called the *Slade*, crosses its southern section, entering Hudson Bay, here known as James Bay, about lat. 52° 15' north, after a course of 400 miles.

EASTMAN, MARY HENDERSON, an American authoress, born in Va. in 1818; married Capt. Seth Eastman in 1835, and resided with him at various frontier stations. She has published numerous books on Indian life, and also many stories in magazines. She wrote *Aunt Phillis's Cabin*, a reply to *Uncle Tom's Cabin* by Mrs. Stowe.

EASTMAN, SETH (1808-75), a United States soldier. In 1829-33 he was on frontier duty; in 1833-40 was assistant teacher of drawing at West Point; in 1840-41 was in the Florida war, and later on the western frontier. He was retired in 1863, and in 1866 was brevetted brigadier-general. He wrote a *Treatise on Topographical Drawing*.

EASTON, the county-seat of Talbot county, Md., situated in a fine fruit region on a branch of the Great Choptank River. It has several schools, an orphan asylum, gas works, peach-canning and fruit-drying establishments, and manufactories of lumber, farm implements and castings.

EASTON, a manufacturing township of Bristol county, Mass. It produces boots, shoes, thread, shovels and hinges. Pop. (1890), 4,493.

EASTON, a city of Pennsylvania, and county seat of Northampton county (see *Britannica*, Vol. VII, p. 616). Easton is delightfully situated on the right bank of the Delaware River, at the mouth of the Lehigh. A chain bridge across the Delaware connects it with Phillipsburg, N. J. It is an important railroad center, being on the Delaware, Lackawanna and Western, the Lehigh Valley, the New Jersey Central, the Belvidere Delaware, the Easton and Amboy, and the Lehigh and Susquehanna railroads. It is the outlet of a rich agricultural region, and has various manufactories, as well as iron works, tanneries, machine shops and paint works. Lafayette College (Presbyterian) is located at Easton. Population in 1880, 11,924; in 1890, 14,185.

EASTON, NICHOLAS (1593-1675), a governor of Rhode Island. He was one of the first settlers in Newbury, Mass., and also in Hampton, N. H., but moved to Rhode Island in 1638, and built the first house in Newport. He was governor of Rhode Island in 1650-52.

EAST ORANGE, a pleasant village of Essex county, N. J., located 12 miles from New York city. It contains the handsome villas of many New York business men. Pop. (1890), 13,161.

EASTPORT, a port of entry of Washington county, Maine, situated on Moose Island, one of the small islands of Passamaquoddy Bay, which receives the St. Croix, the international boundary between the United States and British America. The harbor of Eastport is deep enough for the largest vessels, and the tide rises within it to a height of 25 feet. The place is largely engaged in the fisheries and in ship-building. Population, 3,736.

EAST PORTLAND, a rapidly growing city of Oregon, near the northern boundary of the State, located in Multnomah county, on the east bank of the Willamette River, opposite Portland, in 45° 30' north lat., and 122° 27' 30" west long. It is 12 miles from the confluence of the Willamette and Columbia Rivers, about 120 miles from the ocean, and at the extreme head of navigation for deep-sea vessels of both rivers. It is connected with Portland by two bridges and three ferry lines, and is practically a portion of Portland proper—so much so, in fact, that a movement is at present under way to in-

corporate the two cities into one. Population, 1870, 830; 1880, 2,934; 1890, 10,481.

EAST RIVER, the strait between New York Harbor and Long Island Sound. It is 20 miles long, separating New York city on the west from its suburbs, Williamsburg and Brooklyn, on the east. Its narrowest part is the Hurlgate or Hellgate, which is about the middle of its course. Here the rocks which once obstructed the passage have been removed by blasting. The name—clearly a misnomer for an arm of the sea—is convenient as contrasted with the North River, or Hudson, and may have arisen from the river-like action of the tides—an action so powerful as to have here and there materially deepened the channel.

EAST ST. LOUIS, a city of St. Clair county, Ill., located on the Mississippi River, opposite St. Louis, Mo. A steel bridge across the Mississippi connects the two cities. East St. Louis is an important railroad center, no less than ten railways either passing through or terminating in the city. The largest stockyards in the United States, those of the National Stock Yards' Company, are located here. They comprise 650 acres. The city contains extensive car shops, foundries, rolling-mills, nail factories, gas works, soda factory, breweries, etc. The Howe Literary Institute (Baptist) is located here. There is also a high school, several graded public schools, an academy (Roman Catholic), and a public library, containing 5,000 volumes. Population in 1880, 9,185; in 1890, 15,156.

EATON, the county-seat of Preble county, Ohio, situated on Seven-Mile Creek, 53 miles north of Cincinnati. Pop. (1890), 2,934.

EATON, DANIEL CADY, an American botanist, born in 1834. He became professor of botany in Yale College in 1864. He has published works on botany and many other scientific papers.

EATON, DORMAN B., a prominent New York lawyer. He was born in Vermont, June 27, 1823, and graduated at Harvard Law School in 1850. In 1874 he served on the Civil Service Commission, and from 1883 to 1886 he was again one of its most sedulous and active members. He has contributed extensively to current literature, and is the author of several works on civil service reform.

EATON, WILLIAM (1764-1811), an American soldier. At the age of 16 he entered the Revolutionary army, but left in 1783 after becoming sergeant. In 1791 he became clerk of the Vermont house of delegates, and in 1797 was appointed consul to Tunis. He returned to the United States in 1803; was appointed naval agent to the Barbary States, and accompanied the American fleet to the Mediterranean in 1804. He organized a band of troops, which he led across the desert against Derne, capital of a province of Tripoli, and, with the assistance of the American fleet, captured the place, which he held with great bravery. He was about to attack Tripoli when operations were suspended by a treaty of peace between the United States and Tripoli. On his return to America, Massachusetts gave him 10,000 acres of land as a reward for his gallant conduct.

EATON RAPIDS, a city of Eaton county, Mich., on Grand River, 24 miles northwest of Jackson. It is a railroad junction, and is noted for its mineral magnetic springs. Pop. (1890), 1,970.

EATONTON, a city and the county-seat of Putnam county, Ga., 21 miles northwest of Milledgeville. Pop. (1890), 1,682.

EAU CLAIRE, a city of Wisconsin, and county-seat of Eau Claire county, situated at the head of steamboat navigation on the Chippewa River, and at the mouth of the Eau Claire River. It is the center of important lumber interests, and has ex-

cellent railroad facilities. The two rivers divide the city into three sections. The public buildings are the court-house and city hall. The streets are well paved and lighted with gas and electricity. The industrial establishments include saw-mills, flouring-mills, grain elevators, iron foundries, paper-mills, machine shops, etc. Lumber is the principal article of export. Population in 1880, 10,119; in 1890, 17,438.

EAU CREOLE, a fine liqueur, made in Martinique, by distilling the flowers of the Mammee apple (*Mammea Americana*) with spirit of wine.

EAU DE JAVELLE, a bleaching fluid and antiseptic, containing salt, potassium hypochlorite and potassium carbonate.

Eaux Bonnes, a watering-place of France, in the department of Basses-Pyrenees, situated 20 miles south-southeast of Oloron. It stands in a narrow gorge surrounded by rocks, and is much frequented on account of its hot sulphurous springs, which are four in number, and are used for bathing purposes. Their temperature does not exceed 91° F.

Eaux Chaudes, Les, three miles southwest of Eaux Bonnes, and a similar place of resort. The springs of both places have the same properties. See *Britannica*, Vol. XX, p. 127.

Eaves: in architecture, the edge of a sloping roof which overhangs the wall for the purpose of throwing off the water.

EAVESDROP, or **EAVESDROP** (Ang.-Sax., *yfes-drype*). "The owner of a private estate," says Kemble (*Saxons in England*, *Britannica*, Vol. I, p. 45), "was not allowed to build or cultivate to the extremity of his own possession, but must leave a space for eaves. The name for this custom was *yfesdrype*." The space was regulated by the charter by which the property was held. This Saxon custom corresponded to the well-known urban servitude of the Romans, called *stillicide* (*stillicidium*). Similar regulations existed in Greece, and have probably existed in all countries.

EAVES-DROPPERS "are such as listen under walls or windows, or the eaves of houses, to hearken after discourse, and thereupon to frame slanderous or mischievous tales." Blackstone's *Comm.*, IV, 168. Such persons are regarded as common nuisances. They may be indicted, and, on conviction, are punishable by fine.

EBEL, JOHANNES WILHELM (1784-1861), a German clergyman. He taught for a while in the gymnasium at Königsberg; in 1807 became pastor at Hermsdorf; in 1810 returned to Königsberg as professor in Friedrich College, and six years later was made preacher in the Old Town church there. He wrote many works on religious topics.

EBELING, CHRISTOPH DANIEL (1741-1817), a German geographer. In 1769 he became a teacher in the commercial school in Hamburg, and in 1784 became professor of Greek and history in the gymnasium in that city. He contributed extensively to various periodicals, and published several works on history and geography. He possessed a wide reputation for his knowledge of the geography of America.

EBENACEÆ, a natural order of exogenous plants, consisting of trees and shrubs, with alternate leathery leaves and axillary flowers, which are mono-petalous, somewhat leathery, and generally unisexual, the fruit fleshy. About 160 species are known, mostly tropical, but a few are natives of temperate countries. The wood is in general remarkable for its hardness, as the different kinds of ebony and other species of *Diospyros*; and on account of this quality, even that of species which never attain the ordinary size of timber trees is sometimes accounted valuable.

EBERLE, JOHN (1787-1838), an American physician. He was professor of physics in Jefferson Medical College in 1825 and in 1830 became professor of materia medica. He accepted a similar position the following year in the Medical College of Ohio, and subsequently became professor of medicine at Transylvania University, Kentucky. He was a prolific author on medicine and other scientific subjects.

EBERS, GEORG, a distinguished orientalist and novelist, was born at Berlin, March 1, 1837. At the universities of Göttingen and Berlin he made Egyptology his central study, and later he visited the principal museums of Egyptian antiquities in Europe. In 1870 he was called to Leipzig as professor, at which university he has since remained. He was the discoverer of the Papyrus *E*, during his sojourn in Egypt, in 1872-73, a very important document on account of the insight it gives into the language and culture of the ancient Egyptians. In 1876 he was stricken with paralysis and at once occupied himself with imaginative composition, as a relief from ennui, the state of his health precluding him from indulging in more serious studies. Of his novels, *Uarda, a Romance of Ancient Egypt*, written in 1877, is the most popular. It was followed by *Homo Sum* in 1878, *The Sisters* in 1880, and *The Emperor* in 1881. *The Burgomaster's Wife* and *Serapis* are his latest works of fiction. All his work on Egypt affords evidence of the most profound scientific study.

EBERNBURG, a small town in the Bavarian Palatinate, situated about 20 miles southwest of Mayence, at the junction of the Alsenz with the Nahe.

EBERT, KARL EGON, Bohemian poet, born at Prague, June 5, 1801; educated there and at Vienna, and after filling several situations finally settled in Prague. His chief works are his *Dichtungen* (poems), 2 vols., 1824; *Wlasta, ein Böhmisch-nationales Heldengedicht in drei Büchern* (Wlasta, a Bohemian national heroic poem, in three books), 1829; and *Das Kloster, idyllische Erzählung in fünf Gesängen* (The Cloister, a Narrative Idyl, in five cantos), 1833.

EBERARD, JOHANN HEINRICH AUGUST, a German theologian, born at Erlangen, Bavaria, Jan. 18, 1818, educated at the gymnasium of his native town, and afterwards studied theology at the university there and at Berlin. In 1844 he was called to the professorship of theology at Zurich, Switzerland; returned to Erlangen in 1847, and was made professor of Reformed theology, and in 1853 became counselor in the Royal Consistory of the Evangelical church of the Palatinate at Spire, where he remained until 1861. On his return to Erlangen he devoted himself to literature; in 1875 became pastor of the French colony there, and since 1876 has been president of the reformed synod of eastern Bavaria. He is author of many theological works, several dramas, and a number of short moral and religious stories; has translated Ossian's *Fingal* into German, and prepared a grammar and dictionary of the mediæval Gaelic language.

ECCE HOMO (Lat., "Behold the Man"), the name usually given by artists to paintings representing Christ bound and crowned with thorns previous to his being led forth to crucifixion. The finest *Ecce Homo* is that of Correggio in the National Gallery, London, the whole conception of this remarkable picture being of the finest order of genius.

ECCENTRIC: in machinery, a contrivance for taking an alternating rectilinear motion from a revolving shaft. It consists of a circular disc or pulley, fixed on a shaft or axis which does not pass

through the center of the disc. The eccentric is chiefly used where a subsidiary motion of small power is required; as for working the force-pump that supplies the boiler of a steam-engine.

ECCENTRICITY, a mathematical term which, in the older mathematical works, is used as the name of half the distance between the foci of an ellipse or hyperbola. More properly, the eccentricity is the ratio of half the distance between the foci to the semi-major axis.

ECCHYMOSES, a discoloration of the surface, produced by blood effused below or in the texture of the skin. It is usually attended by swelling to a greater or less extent, and is the result of injury.

ECCLSFIELD, a township in the West Riding of Yorkshire, England, five miles north of Sheffield. The chief manufacture is cutlery, but flax, linen, and nails are also branches of industry. There are coal and iron mines in the vicinity.

ECCLSIASTES. See *Britannica*, Vol. VII, pp. 623-28; also Vol. III, p. 639.

ECCLSIASTICAL CORPORATION. The holder of an ecclesiastical benefice is, by law of England, regarded as a corporation. Ecclesiastical corporations are divided into aggregate and sole. The former consist of several persons, as the head and fellows of a college, the dean and chapter of a cathedral, and are kept up by a continual succession of members. An ecclesiastical corporation sole consists of a single person and his successors in the benefice, as a bishop, a rector, a parson, or a vicar. The object of the common law, in thus regarding the incumbent of the benefice as a corporation sole, is to preserve the temporalities which are vested in him, and which would otherwise descend to his right heirs.

ECCLSIASTICAL COURTS, courts specially devoted to the consideration of matters relating to the clergy and religion. In England and Scotland they also have peculiar jurisdiction over questions of tithes, and matrimonial and testamentary causes. These courts were first instituted at the time of the Norman Conquest, and have continued with various modifications down to the present day.

ECCLSIASTICAL TITLES ASSUMPTION ACT, the title of an act of the English Parliament (14 and 15 Vict., c. 49) passed to prohibit the assumption of the title of archbishop, bishop, or dean, by any person in England or Ireland, claiming the right to such title by virtue of an appointment by the Pope, or papal authorities. A penalty of £100 was provided for a violation of the act. By 34 and 35 Vict., c. 50, the Ecclesiastical Titles Assumption act was repealed.

ECCLSIOLOGY, the name which has been given in the British Islands to the study of church architecture and decoration. It has a literature of its own, including a monthly journal, called "The Ecclesiologist." There are societies for promoting its study, one of which, "The Ecclesiological late Cambridge Camden Society," has published *A Handbook of English Ecclesiology* (Lond., 1847).

ECCLISON, SAMUEL (1801-51), an American Roman Catholic archbishop. He was ordained in 1825, and later studied in Paris. On his return he became first vice-president, then president of St. Mary's College. In 1834 he became archbishop of Baltimore.

ÉCHELON, such a formation or arrangement of troops that, if viewed from a height, they would present some analogy to the successive steps of a ladder or staircase. The several divisions of the force, although parallel, are no two on the same alignment. Each has its front clear of that in advance, so that, by marching directly forward, it can form line with it. The word *échelon* is also used in

reference to nautical maneuvers. A fleet is said to be arranged *en échelon* when it presents a wedge-form towards the enemy.

ECHIMYD (*Echimy*s), a genus of rodent quadrupeds, in some of their characters agreeing with dormice, but differing from them in having the tail scaly, and the fur coarse and mingled with flattened spines. They are all South American.

ECHINOCACTUS, a genus of plants of the cactus family, comprising more than two hundred species, most of which belong to Mexico and the United States. They bear large, showy flowers, and are armed with clusters of short spines.

ECHIUM, a genus of boraginaceous plants, of which there are about fifty species, represented by the common blueweed or viper's bugloss.

ECHO: in music, the repetition of a melodic phrase, frequently written for the organ, on account of the facility with which it can be produced by the stops.

ECHO CAÑON, a remarkable ravine in the midst of magnificent scenery, in Summit county, Utah Territory, 975 miles from Omaha.

ECKARDT, JULIUS, a German writer, born in 1836. In 1860 he settled in Riga as a consulting advocate, and later became secretary of the provincial consistory of Livonia. For a time he edited the "Rigasche Zeitung," the organ of the German party in the Baltic provinces, and in 1867 went to Germany, where he edited various journals. In 1870 he was made secretary of the Senate of Hamburg, and in 1882 became connected with the Prussian state service. He is the author of numerous works on the Baltic provinces.

ECKERT, THOMAS THOMPSON, an American telegrapher, born in 1825. He was connected with various telegraph lines until the beginning of the civil war, when he took charge of the military telegraph office at the headquarters of Gen. McClellan. In September, 1862, he established the military telegraph headquarters in the War Department building at Washington. In 1864 he was brevetted brigadier-general, and then appointed Assistant Secretary of War, retaining the office until 1866, when he resigned. He has since been connected with various telegraph companies, and in 1881 became vice-president and general manager of the Western Union Telegraph Company. In March, 1893, he became president of that institution.

ECKFORD, HENRY, naval architect, born in Scotland, March 12, 1775, died in Constantinople, Turkey, November 12, 1832. During the war of 1812 he was employed by the United States Government to construct vessels-of-war for the lakes and inland waters. Later he built the steamer *Robert Fulton*, which eventually was purchased by the Brazilians. In 1820 Mr. Eckford became United States naval constructor at the Brooklyn navy yard. Under his direction the government built six ships of the line. In 1831 he built a sloop-of-war for the Turkish navy, and was preparing to enter the service of that government as chief naval constructor when he died.

ÉCOLE POLYTECHNIQUE, one of the most celebrated military academies of France. It was established in Paris in 1794, at the Palais de Bourbon, for the purpose of educating young men for military, naval and civil engineering. In 1804 Napoleon made the organization of the school more strictly military, to identify it more fully with the army. Candidates are only admitted after competitive examination. To be eligible the youth must be French, and between sixteen and twenty years of age; although soldiers who have served two years in the regular army are admissible up to the age of twenty-five. The course of instruction lasts two

years, when graduates have the privilege of choosing from among the various public services supplied from this school, the particular branch they wish to enter. The school was reorganized in 1852, under the title of *Ecole Impériale Polytechnique*.

ECONOMY, a Socialist village of Pennsylvania, on the right bank of the Ohio, about 17 miles from Pittsburgh. The settlement was planted in 1825 by immigrants from Germany. The inhabitants own everything in common—3,500 acres of land, upwards of 100 houses, with a church, a school, a museum, and manufactories of wool, cotton, and silk.

ÉCORCHÉ, a figure in which the muscles are represented, stripped of the skin, for purposes of artistic study. From a portion of the figure, the upper muscles are also removed, so as to exhibit those which lie nearer to the bone.

ÉCOUTES, in military operations, connected with siege works, are listening places. They are small galleries, excavated at regular distances, and going out beneath and beyond the glacis, towards the lines and batteries of the besiegers. Their purpose is to enable the garrison to hear and estimate the works being carried on by the sappers and miners of the enemy.

ECTROPION, an everted condition of an eyelid, in consequence of which it does not cover the globe of the eye. It is capable of being remedied by a slight surgical operation.

ECTROTIC, a term applied to methods of treatment which aim at preventing the development of a disease.

ECTYPOGRAPHY, a method of etching, in which the lines are raised on the plate, in place of being sunk into it.

ECTYPUM, a cast in relief of an ornamental design, produced from a mold.

ECUADOR (*Republica del Ecuador*). For its location, history, topography, climate, productions, political and social condition, and earlier statistics, see *Britannica*, Vol. VII, pp. 644–649. According to the latest official statistics the area of the Republic is 120,000 square miles, divided into 16 provinces, and one territory with a population of 1,220,000; 100,000 whites, 300,000 mixed, and 800,000 Indians, besides an unknown number of uncivilized Indians. The capital, Quito, has a population of 50,000. Other chief cities are Guayaquil, with a population of 40,000; Cuenca, 30,000; Riobamba, 18,000; and Latacunga, 10,000. The religion of the Republic, according to the constitution, is Roman Catholic, to the exclusion of every other. Primary education is gratuitous and obligatory. There is a university at Quito, and university bodies in Cuenca and Guayaquil. There are 37 secondary schools, and 856 primary schools, with about 60,000 pupils. There are also a military school, commercial schools, and technical schools.

The revenue of the Republic for 1889–90 was 4,252,522 sucres, and the expenditures for the same period 4,429,246 sucres. The public debt is \$18,523,400. More than one-half the revenue is derived from customs duties on imports at the port of Guayaquil, the amount received from this source during 1889 being 2,477,543 sucres. Although the national convention of 1884 determined that the standing army should consist of but 1,600 men, the official statement for 1889 places the number actually in service at 3,000. The national guard consists of 30,000 men.

The exports from Ecuador in 1889 amounted to 12,000,000 sucres, of which the chief articles were: cocoa, valued at 5,400,000 sucres; India-rubber, 189,000 sucres; hides, 195,000 sucres; coffee, 590,000 sucres; vegetable ivory, 210,000 sucres; precious metals,

810,000 sucres. There are no trustworthy statistics of imports. The foreign commerce is chiefly with Great Britain.

The roads of the country are mostly bridle-roads, although a few cart-roads have been established in the interior. Only one railway is in course of construction, running from Duran (opposite Guayaquil) to Chimbo, a distance of about 50 miles. The total length of telegraphs is about 1,200 miles.

EDBROOK, WILLUGHBY J., an American architect, born in 1843. In 1860 he became an apprentice to his father, a contractor and builder, and devoted himself to the study of architecture. The following year he went into business for himself, and soon became prominent as an architect. He was city commissioner of buildings of Chicago, Ill., and on April 13, 1891, became Supervising Architect of the United States Treasury.

EDDY, THOMAS (1758–1827), an American philanthropist. In 1779 he settled in New York and became a merchant, but failed in 1784. In 1790 he entered the insurance business and soon made a large fortune. He was active in the establishment of a penitentiary system, and was director of the first building for four years. He became a governor of the New York hospital in 1793, and in 1815 was one of the founders of the Bloomingdale Insane Asylum. He labored for the construction of the Erie Canal, and was one of the originators of the New York Savings Bank, and also of the New York Bible Society. He wrote a work on the *State Prison of New York*.

EDDYSTONE, a group of gneiss rocks, daily submerged by the tide in the English Channel, nine miles off the Cornish coast, and 14 miles south-south-west of Plymouth breakwater. The rocks lie in latitude 50° 10' 54" N., and longitude 4° 15' 53" E., and have 12 to 150 fathoms water around. These rocks are the site of the light-house which bears their name.

EDEN, a river rising in the east of Westmoreland, in the Pennine Chain. It runs north-north-west through the east of Westmoreland and Cumberland, past Appleby and Carlisle, and ends in a fine estuary at the upper part of the Solway Firth, after a course of 65 miles.

EDENTON, a county-seat of Chowan county, N. C., and a port of entry on Edenton Bay, which opens into Albemarle Sound. Pop., 2,205.

EDGARTOWN, a port of entry and county-seat of Dukes county, Mass. It is on Martha's Vineyard, and has a small safe harbor. Pop., 1,156.

EDGE CUMBE. 1. A bay in the coast of Australia, lies within the province of Queensland, near latitude 20° S. and longitude 148° E. It is sheltered on every side but the north, its east barrier terminating in Cape Gloucester. 2. A mountain in Alaska marks the northwest point at the mouth of Norfolk Sound which connects the metropolitan settlement of New Archangel on the island of Sitka with the open ocean. It rises from the water's edge an almost perfect cone, which during nearly the whole year is capped with snow.

EDGEHILL, an elevation near the village of Keinton, Warwickshire, Eng., where the first great battle of the civil war was fought on Sunday, Oct. 23, 1642, between the Royalist forces under Charles and the Parliamentarians under the Earl of Essex. The Royalists were defeated, and after the battle 4,000 men lay slain at the foot of Edgehill, most of whom were Royalists.

EDGERTON, a city of Rock county, Wis., 25 miles southeast of Madison. Pop., 1,595.

EDGINGS, a name given by gardeners to the borderings of walks in gardens and lawns. They are sometimes made of stone and not infrequently of

wire-work; but for many purposes the best edgings are formed of low growing plants.

EDINBOROUGH, a village of Erie county, Pa., containing a State normal school.

EDINBURGH, a village of Johnson county, Ind., on Blue River. It has good water-power, hominy-mills, and a starch factory.

EDINBURGH, a small village of Grundy county, Mo. It contains Grand River College.

EDINBURGH, ALFRED ERNEST ALBERT, DUKE OF, second son of Queen Victoria, born at Windsor Castle in 1844, and entered the navy in 1858. The crown of Greece was offered to him in 1862, but he declined it. In 1866 he entered the House of Lords as first Duke of Edinburgh. In 1867 he visited Australasia, India, China and Japan. In 1868 he was wounded by O'Farrell, a Fenian, who was subsequently executed. In 1874 he married Marie Alexandrovna, daughter of the Czar Alexander II. In 1886 he was appointed admiral in command of the Mediterranean squadron, with which, in 1888, he visited some of the chief continental capitals. He received, in the latter year, the honorary rank of general of infantry in the German army, and was invested by the queen-regent of Spain with the order of the Golden Fleece.

EDINBURGH (DUCHESS OF), MARIE ALEXANDROVNA, Grand Duchess of Russia, only daughter of the late Emperor of Russia, and sister of the present emperor, was born at St. Petersburg, Oct. 17, 1853, and married there to Prince Alfred, Duke of Edinburgh. On Oct. 15, 1874, she gave birth, at Buckingham Palace, to a son, who was baptized by the name of Alfred Alexander William Ernest Albert. The Duchess of Edinburgh's other children are the Princess Marie Alexandra Victoria, born Oct. 29, 1875; the Princess Victoria Melita, born at Malta, Nov. 25, 1876; the Princess Alexandra Louis Olga Victoria, born at Cobourg, Sept. 1, 1878, and the Princess Beatrice Leopoldine Victoria, born April 20, 1884. English people have dubbed her "The Little Russian Bear."

EDISON, THOMAS ALVA, an American inventor, born in Alva, Ohio, Feb. 11, 1847. At the age of 12 he became a newsboy on the Grand Trunk line, and later printed the "Grand Trunk Herald," which he sold with his other papers. Subsequently a station-master taught him telegraph operating. His first invention was an automatic repeater, by which a message could be transferred from one wire to another without the aid of an operator. In 1864 he conceived his duplex telegraph, and in 1872 this system was successful. In 1871 he invented the printing telegraph for gold and stock quotations. Among his later inventions are his system of duplex telegraphy developed into quadruplex and sextuplex transmission; the carbon telephone transmitter, the microtasmeter; the aëraphone; the megaphone; the phonograph, and the phonometer. His attention has been given for some time to the development of electric lighting, and he perfected the incandescent lamp. He also solved the problem of the general distribution of electricity, like gas, and his system is now in general use. In 1878 Union gave him the degree of Ph. D., and the same year the French government made him a Chevalier of the Legion of Honor.

EDISTO, a river of South Carolina. It flows through the southwest part of the State, being formed near Branchville of the North Edisto and the South Edisto, and entering the Atlantic by two arms respectively named from the two confluents. Edisto also designates the island which separates those two arms. The stream is navigable for 100 miles upwards, and its mouth is about 20 miles to the southwest of Charleston.

EDMONDS, FRANCIS W. (1806-63), an American artist. He was a bank cashier in Hudson and New York until 1855, studying in the mean time at the National Academy of Design. He was elected an associate in 1838, then a trustee, and in 1840 he became an academician. He studied in Europe and later was instrumental in the establishment of the New York gallery of fine arts. Among his productions are: *Barnyard*, *Sewing Girl*, *The City and Country Beauts*, *The Penny Paper*, *Vesuvius and Florence*, and *The Sleepy Student*.

EDMONDS, JOHN WORTH (1799-1874), an American jurist. He began the practice of law in Hudson, N. Y., in 1820, and later became State recorder. In 1831 he was a member of the State assembly and in 1832-36 of the State Senate. In 1836-38 he was on a special mission among the Indians for the Government, and on his return resumed the practice of law. In 1843 he became one of the State-prison inspectors, and subsequently was instrumental in many important reforms in prison discipline. He was made a circuit court judge in 1845, a judge of the State Supreme Court in 1847, and judge of the court of appeals in 1852. He was converted to the doctrines of spiritualism in 1851, and later published books on this subject as well as on law.

EDMONSTONE ISLAND, an outpost, as it were, of the delta of the Ganges toward the Bay of Bengal, situated at the mouth of the Hoogly, the most westerly arm of the great river above mentioned, in latitude 21° 32' N., and longitude 88° 20' E.

EDMONTON, a large village in the northeast of Middlesex, near the Ken, seven miles north-northeast of London. Population of parish (1871), 13,859. It contains many villas of London merchants, etc. Charles Lamb is buried in the churchyard here. Edmonton is connected with Cowper's humorous poem of *John Gilpin*.

EDMORE, a railroad junction and shipping point in Montcalm county, Mich., 33 miles north of Ionia.

EDMUNDS, GEORGE FRANKLIN, an American statesman, born in 1828. He received a public school education and the instruction of a private tutor; studied and practiced law; was a member of the Vermont legislature in 1854, '55, '57, '58 and '59, serving three years as speaker; was a member of the State Senate, and its presiding officer *pro tempore* in 1861-62; was appointed to the United States Senate as a Republican to fill the vacancy caused by the death of Solomon Foot, and took his seat April 5, 1866; was elected by the legislature for the remainder of the term ending March 4, 1869, and has since been successively reelected four times. He was a member of the Electoral Commission of 1877. His term would have expired March 3, 1893; but in consequence of impaired health he tendered his resignation as Senator in April, 1891, to take effect Nov. 1, ensuing.

EDMUND'S (ST.) HALL, Oxford, derives its name from St. Edmund, archbishop of Canterbury in the reign of Henry III. As early as 1269, it appears to have been purchased by the canons of Osney, and devoted to purposes of education. On the dissolution of religious houses under Henry VIII, it fell into the hands of two citizens of Oxford, who sold it to William Denyse, provost of Queen's College. The provost devised it to his college, and that society accordingly now nominates the principal of St. Edmund's Hall.

EDUCATION, SECONDARY, or that which intervenes between the primary and the higher, is in America afforded by grammar and high schools, or by academies. The primary design of these institutions is to fit students to enter upon col-

legiate studies, and thus relieve well-equipped colleges from the incumbrance of fitting-schools. In addition to high schools and academies there are many private institutions that afford secondary education, and many of the colleges have found it necessary to establish preparatory departments.

EDWARDS, AMELIA BLANDFORD, an English writer of fiction and Egyptologist, born in 1831. She early became proficient in music, and was inclined to embrace that art, but being drawn into literature she soon became known to the world by her novels. *Barbara's History* was published in 1864. *Lord Brackenbury*, which appeared in 1873, has been five times translated. Her books of travel have also attained great popularity. Of these, *Untrodden Peaks and Unfrequented Valleys* was published in 1873, and was followed in 1877 by *A Thousand Miles Up the Nile*. As an archaeologist she has written many valuable articles for leading reviews and magazines. It was largely due to her exertions that the Egyptian exploration fund was founded in 1883. During the winter of 1889-90 she lectured in the United States. Columbia College has conferred upon her the honorary degree of L. H. D. Miss Edwards died April 15, 1892. She founded a chair of Egyptology at Oxford, being devoted to that study.

EDWARDS, BELA BATES (1802-1852), an American clergyman. He was licensed to preach in 1830. From 1828 to 1833 he was assistant secretary of the American Education Society. He was made professor of Hebrew in Andover Theological Seminary in 1837, and in 1848 was elected associate professor of sacred literature. In 1828-42 he was editor of the "American Quarterly Register;" in 1833-35 of the "American Quarterly Observer;" in 1835-38 of the "American Biblical Repository," and in 1844-52 of the "Bibliotheca Sacra." He wrote several works on miscellaneous subjects.

EDWARDS, JONATHAN, JR. (1745-1801), an American theologian. He received a license to preach in 1766; was a tutor at Princeton College from 1767 to 1769, when he became pastor of the society in White Haven, Conn.; was made pastor of the church at Colebrook in 1796, and in 1799 became president of Union College. He wrote many important works on theological subjects.

EDWARDS, JUSTIN (1787-1853), an American clergyman. He was ordained in 1812; became a member of the executive committee of the New England Tract Society, and in 1821 became corresponding secretary. He was prominent in the organization in Boston of the "American Society for the Promotion of Temperance," in 1825. He was for a while pastor of a new church in Boston, but resigned in 1830 to devote the next six years to the cause of temperance. From 1836 to 1842 he was president of the Andover Theological Seminary, when he became secretary of the American and Foreign Sabbath Union. The last few years of his life were spent in writing on religious topics.

EDWARDS, MATILDA BARBARA BETHAM, an English novelist, born at Westerfield, Suffolk, in 1836. She began to write at an early age, and has published *The White House by the Sea*; *Doctor Jacob*; *Kitty*; *A Winter with the Swallows in Algeria*; *A Year in Western France*, and *Mrs. Punch's Letters*.

EDWARDS, NINTAN (1775-1833), a United States Senator. He was admitted to the bar in Kentucky in 1798, and in Tennessee the following year. He was appointed judge of the general court of Kentucky, judge of the circuit court in 1803, of the court of appeals in 1806, and chief justice of the state two years later. From 1809 to 1818 he was governor of the Territory of Illinois, and from 1818 till 1824 was a United States senator from the State

of Illinois. From 1826 to 1830 he was again governor of Illinois.

EDWARDS, OLIVER, American soldier, born in Springfield, Massachusetts, in 1835, entered the Northern army at the beginning of the civil war, and rose, gaining almost every step by acts of personal gallantry, to the rank of brigadier-general in 1865. His services were most conspicuous during the second day of the battle of the Wilderness; at Spotsylvania (1864), where he held the "bloody angle" for eleven hours with his own brigade, and, at the head of twenty regiments, faced the enemy for thirteen hours thereafter; and at Sailor's Creek, where he captured Generals Custis Lee and Ewell. General Edwards, after the war, returned to mercantile pursuits.

EDWARDSVILLE, the county-seat of Madison county, Ill., on the Cahokia Creek, 19 miles northeast of St. Louis, Mo. It has two railroads, two newspapers, manufactories of plumbers' supplies, bricks, carriages and wagons. Its population in 1890 was 3,561.

EELS in paste, vinegar, etc., are animalcules (*Infusoria*) of the family *Vibrionidae*. When at rest they appear like very minute hairs, or bits of very fine thread. Some of them wind themselves about in a spiral form when they move. The species are numerous, and they occur in almost all vegetable substances beginning to undergo decay, which they hasten. See *Britannica*, Vol. IX, p. 98, note.

EFFARE, or EFFRAYÉ, in heraldry, signifies that the animal to which it refers is to be represented as rearing on its hind-legs, as if it were frightened or enraged.

EFFECT, the general impression produced on the mind by the first sight of a picture or other work of art, or the impression which it produces when seen from so great a distance as to render the details invisible. The term has reference both to design and coloring, which, if correctly indicated, may be judged of with perfect confidence before either has been completed in detail.

EFFENDI, a title of honor among the Turks, bestowed upon civil dignitaries and persons of various ranks, in contradistinction to the title of Aga, borne by courtiers and military men.

EFFERVESCENCE. Nearly all gases are more or less soluble in water, the amount of solubility depending on various conditions of pressure and temperature. The lower the temperature and the greater the pressure, the greater the solubility of a gas, so that when the temperature of such a solution is raised, or the pressure lowered, the gas escapes in small bubbles, giving rise to the phenomenon effervescence.

EFFINGHAM, a city and county-seat of Effingham county, Ill., 199 miles southwest of Chicago. It is engaged in the manufacture of brick.

EFFLORESCENCE, a term applied to the appearance of a white incrustation on the walls of buildings, or when a salt loses its water of crystallization, and presents a white powdery appearance on the surface. Common washing-soda exposed to the air affords a good illustration of this phenomenon.

EFT, a term of Anglo-Saxon origin, applied both to lizards and newts, which, notwithstanding the important differences between them, were until recently confounded even by naturalists. In works of natural history, the term eft is now used as synonymous with newt.

EGAN, PIERCE (1772-1849), the author of many works, including *Boziana* and *Life in London*. His son Pierce Egan, the younger (1814-80), wrote many novels for "Reynolds' Miscellany" and the "London Journal."

EGERIA, the name of the Nymph or Camena, from whom, according to the legend, King Numa received the ritual of public worship which he established in Rome. The grove where Numa met the goddess to receive her instructions was dedicated by him to the Camenæ.

EGG, or EGG, an island 12 miles off the west coast of Inverness-shire, and eight miles southwest of the south point of Skye. It is $4\frac{1}{2}$ miles long by $2\frac{1}{2}$ broad. It consists chiefly of trap, which in the north alternates with sandstone and limestone, the latter rocks containing oolitic fossils, carbonized wood and coal.

EGGA, a large town of the Soudan, Africa, Yaruba country, situated on the right bank of the N'iger, in latitude $8^{\circ} 43'$ north, longitude $6^{\circ} 20'$ east. Its streets are narrow; the houses are principally huts, built of clay, the walls smooth, and stained with indigo. Great quantities of narrow cotton cloth, generally dyed blue, are manufactured here. The population is partly Mohammedan and partly Pagan. See Britannica, Vol. XXII, p. 279.

EGGAR MOTH, the name of certain species of moth, of the genus *Lasiocampa*, allied to the silk-worm moth (see Britannica, Vol. IV, plate XXX. Fig. 26). One species (*L. trifolii*), of a uniform foxy ochreous color, with wings expanding about two inches, produces a caterpillar as thick as a swan's quill, hairy and ochreous brown.

EGG-BIRD (*Hydrochelidon fuliginosum*, or *Sterna fuliginosa*), a bird of the gull family, sometimes called the SOOTY TERN (see TERN in Britannica, Vol. XXIII, p. 189). It is larger than the common tern of the British shores; has a long, slender, nearly straight, compressed, sharp bill; very long, narrow, and pointed wings, and a long, deeply forked tail; the general color is glossy black on the upper parts, except the forehead and the edges of the wings, which, with the under parts, are white. It abounds in the West Indian seas. The nest of the egg-bird is merely a little excavation in the sand, and usually contains three eggs, which are fully two inches long, of a pale-cream color, sparingly marked with light brown and purple tints. The eggs are esteemed delicious, and form an object of profitable adventure in the months of March, April and May, to the crews of numerous small vessels, fitted out from Kingston, Havana, and other West Indian ports.

EGGLESTON, EDWARD, an American author, born in 1837. He became a Methodist preacher in 1856, and later held pastorates at St. Peter's, St. Paul, Stillwater and Winona. In 1866 he was associate editor of the "Little Corporal," a children's paper, published in Evanston, Ill.; in 1867-70 was editor of the Chicago "Sunday-School Teacher;" in 1870-71 was editor of the "New York Independent," and in 1871-72 was editor of "Hearth and Home." From 1874 to 1879 he was pastor of the Church of Christian Endeavor, in Brooklyn. His novels depicted early life in Indiana, and have been widely read.

EGG-PLANT (*Solanum melongena*), an annual usually less than two feet high, with stem partially woody; fruit resembling an egg in shape only, being purple, and attaining very large dimensions under good culture in a proper climate, as that of New Jersey. The fruit is much used as a food, not only in the tropical countries of which the plant is a native, but in warm countries generally, into which it has been introduced.

EGHAM, a village of Surrey, England, on the right bank of the Thames, eight miles south-southeast of Windsor and 21 west of London. In the vicinity are Runnymede, Cooper's Hill and the Royal Holloway College for Women, opened by the Queen in 1886. Population of parish, 9,000.

EGILSSON, SVEINBJÖRN (1791-1852), an Icelandic antiquarian and lexicographer. In 1819 he became assistant in the Latin school at Bassastadir, and in 1846 was called to the rectorate at Reikjavik. He gained his reputation through his dictionary of the words used in the Old Norse poetry, his Latin translation of the sagas of the Norse kings, and his Icelandic translation of Homer.

EGMONT, PORT, on the northern coast of West Falkland Island, between Saunders and Kappel islands. It has good anchorage and water for vessels, but no provisions can here be obtained.

EGOISM, an ethical term, used in the sense of selfishness; it is especially opposed to altruism. The word is sometimes used to denote a metaphysical system of subjective idealism, in which the ego is the sole reality.

EGREMONT, a market-town of Cumberland, England, on the River Eden, six miles southeast of Whitehaven. It contains mines of iron ore. On an eminence stand the ruins of Egremont Castle, the legend of whose horn forms the subject of a poem by Wordsworth. From 1749 till 1845 Egremont gave the title of Earl to the Wyndham family. Population, 5,976.

EGYPT: For the geography, climate, productions, history and earlier statistics of Egypt, see Britannica, Vol. VII, pp. 700-788. The historical record in Vol. VII ceased in 1877, at which time Ismail I. was the reigning Khedive. Ismail I. was, at the instance of the Western powers, deposed by his suzerain, the Sultan, in June, 1879, and Prince Tewfik, his eldest son, was proclaimed in his stead. The year 1880 saw the passage of the Law of Liquidation, a measure participated in by five European powers for regulating the public debt. The year following witnessed the revolt of Arâbi Pasha. He demanded the expulsion of foreign officials and a cessation of foreign interference and met with a large measure of popular support. He was practically a military dictator, and in 1882 British and French war-ships were dispatched to Alexandria to overawe the rebels, but their appearance was followed in June by rioting and massacres of Europeans in the streets. Meanwhile Arâbi was strengthening the fortifications. The British admiral demanded that the work should be discontinued. Arâbi persisted; the French sailed away in dismay; and the British ships bombarded the fortifications (11th July). On the sudden withdrawal of the Egyptian troops, the city was plundered and partly burned by rioters. Three days elapsed before a force sufficiently strong to cope with the insurgents could be landed. This was at last effected by Sir B. Seymour, who was soon to be reinforced by troops from England and some regiments of sepoys from India. Sir Garnet Wolseley took command of these forces, and crossing the desert attacked and utterly routed the main body of Arâbi's army at Tel-el-Kebir, and occupied Cairo. Arâbi was banished to Ceylon, the authority of the Khedive restored, and measures taken for the reorganization of the country. This labor was entrusted to Sir E. Baring, who has proceeded upon the lines of a constitution drawn up by Lord Dufferin. A conference of the great powers in 1884 did not sanction the British scheme for managing Egyptian finance. The beneficial effects of British rule were greatly marred by the severe visitation of cholera, which swept away no less than 150,000 persons in the summer of 1883, and this was followed in 1884 by a wide-spread rebellion which broke out in the Soudan under the leadership of the Mahdi. This religious fanatic, Mohammed Ahmed, put himself forward as a prophet whose mission was to free Islam from external enemies and re-establish the

pure, primitive faith. An attempt of Rauf, the governor-general, to suppress this propaganda had been resisted with bloodshed in August, 1881, and thenceforward the movement had spread rapidly. In January, 1883, Sennaar revolted, and the Mahdi occupied El-'Obeyd. Hicks Pasha's command, sent against him by the Egyptian government, was annihilated near El-'Obeyd in November, 1883. An Egyptian force, under Consul Moncrieff, was routed with severe loss in the same month near Suakin, and Baker Pasha was twice disastrously defeated at Teb and Tamanieb, early in 1884. In January, 1884, General Charles George Gordon, the leader of the "Victorious Army" against the Tae-ping rebels in China, went to Khartoum as England's representative, at the request of Gladstone's government, to secure the withdrawal of the Egyptian garrisons from the Soudan, Egypt having, on the advice of England, agreed to give up all her possessions in the Soudan except the Red Sea littoral. Notwithstanding it was known that Gordon's negotiations had proved unsuccessful, and that he was practically hemmed in by the Mahdi's followers in Khartoum, indecision marked the course of the English government. The proverbially weak foreign policy of the liberals was evidenced by vacillating behavior and innumerable delays. The colonies of Canada and Australia had patriotically responded to the call for troops from Downing street, and for the first time in history colonial troops stood side by side with British soldiers on an enemy's soil. Gordon, a popular hero already in the eyes of the English nation, became doubly so when the extent of his peril was known. At last, in October, 1884, yielding to the pressure of public opinion, the government dispatched an expedition to Khartoum under Lord Wolseley, who, selecting a difficult and tortuous route up the Nile, arrived before the city only in time to learn of the assassination of Gen. Gordon two days before. The expedition withdrew without attempting to retaliate, and the Soudan, save for a few not very resolute military operations around Suakin, was left to enjoy its anarchy. The news of the heroic Gordon's death was received in England with a grief that was wide-spread. A song, composed in his honor, "Too late, too late to save him," was sung everywhere and public indignation against the government, which had abandoned its representative to a cruel death at the hands of semi-barbarians, ran high. Cabinet ministers were hissed on the open streets and a keen disgrace was felt to have been inflicted upon the honor of the entire nation.

The Mahdi is now dead, and his Calif Abdallah reigns in his place. Sheikh Senousi, of Tripoli, is believed to have obtained possession of much of the Soudan, but beyond this little is known to the outer world.

Tewfik Pasha, the Khedive of Egypt, died Jan. 7, 1892. He was succeeded by his son, Prince Abbas, who ascended the throne Jan. 16, 1892. Since the rebellion in 1882, an English army of occupation has remained in Egypt. Its present strength approximates 4,000 men. Late in 1892 the present Khedive, yielding to French influence, gathered around him a ministry inimical to English interests. A laconic message being sent him by the British representative that his ministers must be dismissed, elicited the prompt reply that the Khedive had already complied. At this writing, however, the rumor is rife that the Khedive is sounding the sheikhs with the view of ascertaining to what extent he may count upon their support and that his intentions are to engage at no distant day in a determined struggle for native Egyptian supremacy.

The public debt of Egypt in 1892, including the

three percent. loan of £9,024,500 guaranteed by the powers, was £106,572,400.

The budget for 1892 shows a revenue of £9,950,000, with an expenditure of £9,400,000. The charges on account of debts of all descriptions in 1892 are estimated at £4,519,637. Exports £11,876,087; imports £8,081,297. Egypt has a railway system of a total length of 1,127 miles; telegraph 3,168 miles, and there is a telephone line between Cairo and Alexandria.

EGYPT EXPLORATION FUND, a society founded in 1883, under the presidency of Sir Erasmus Wilson, for the purpose of historical investigation in Egypt, conducted in a scientific manner, with the object of solving some of the many important questions which await the result of excavation. Special attention has been directed to all that can bear on the history of the sojourn and exodus of the Israelites, and the early sources of Greek art. The work is conducted on the principle of careful examination of all details and preservation of the objects found. These objects are of great interest in illustrating comparative art by the influences of Egyptian, Greek and Syrian styles on one another, the technical processes of metal work, metrology and the ceramic arts. The antiquities found are divided between the National Museum of Egypt, the British Museum, the Boston Museum of Fine Arts, and various local museums in England and the colonies. Annual volumes are published, giving the results of each season's work with maps and plates. In 1890, M. Edouard Naville commenced the exploration of the Heracleopolis under the auspices of the society.

EHNINGEN, a town of Würtemberg, Germany, situated 21 miles S.E. of Stuttgart, is the rendezvous of a great number of peddlers, who traverse the neighboring districts for the purpose of disposing of their wares. Population, about 6,000.

EHNINGER, JOHN WHETON, an American artist, born in 1827. He studied in Europe in 1848-49, and again in 1851-52. Besides drawing in outline, pencil and India ink, he has produced many popular paintings, principally illustrative of New England rural life.

EHRENFELD, a busy town of Prussia, two miles west of Cologne, manufactures glass-ware, railway fittings, chemicals and bricks; it has also flour-mills and machine-shops. Population, 18,243.

EICHWALD, CHARLES EDWARD, a Russian naturalist, born at Mitau, Russia, July 4, 1795, died at St. Petersburg, Nov. 10, 1876. He studied at Berlin and Vienna. In 1840 he made a geological journey through Italy, Sicily, and Algeria. His geognostic, botanical, and zoological researches were unquestionably of more service to Russia than those of any man since Pallas.

EIFFEL TOWER, an immense iron structure designed and built by M. Eiffel, in Paris, France, for use in the great Paris Exposition in 1889. It was the outcome of a series of investigations undertaken by M. Eiffel in 1885 with the view of ascertaining the extreme limits to which the metallic piers of viaducts could be safely pushed, this special line of investigation having reference first to a proposed bridge with piers 400 feet in height, and of 140 feet base. The general plan of the great tower speedily followed, and in its elaboration care was taken to give to the angles of the tower such curves as would best enable it to resist the transverse effects of wind pressures, without the use of diagonal bracings connecting the members of those angles.

The Eiffel Tower, therefore, has been well described as consisting essentially of a pyramid composed of four great curved columns, independent of each other, and connected together only by belts of girders at the different stories, until the columns unite toward the top of the tower, where they

are connected by ordinary bracing. Iron and not steel was used in the construction throughout.

There are four independent foundations, each standing at one angle of a square, about 330 feet on a side; the two piers nearest the Seine were known as numbers 1 and 4, those adjoining the Champ de Mars as 2 and 3. On the site of the two foundations 2 and 3, the bed of gravel was met with 23 ft. below the surface; the thickness at this point is about 18 ft. The conditions for obtaining a good foundation were therefore extremely favorable, and the piers were built upon a bed of cement concrete 7 ft. in thickness. The two piers nearest the Seine required different treatment. The bed of sand and gravel was only met with about 40 ft. below the surface; that is to say, about 16 feet lower than the mean water level of the Seine, and it was overlaid by soft and permeable deposits. Excavations were pushed, by means of caissons and compressed air, to a depth of about 53 ft. below the surface, and it was found that, under the gravel, variable deposits of fine sand, formed of limestone and sandstone, had accumulated, having been left there by the water after the clay had been washed out in hollows by the stream. Owing to this there existed a good and incompressible bed about

projecting white, blue, and red beams. Reflectors will throw these beams over Paris, and will help to illuminate the Champ de Mars.

Provision is made for protecting the structure from the effect of lightning by means of cast-iron pipes, 19 inches in diameter, and passing through the water-bearing strata below the level of the Seine for a distance of 60 feet. At one end these pipes are turned vertically, and are connected with the iron-work of the tower. There are eight pipes in all, two for each column.

The total weight of wrought and cast iron that has been used in this unique structure is 7,300 tons, not including the weight of the caissons employed in the foundations nor the machinery installed for working the elevators. The total weight of iron employed in the structure itself is 7,300 tons. The weight of rivets is 450 tons, and their total number 2,500,000. Of this quantity 800,000 were riveted up by hand on the tower itself, during the work of fixing together the finished pieces which had been completed at M. Eiffel's establishment. The number of pieces of iron of different forms is 12,000, and each of these required a special drawing; there were thus no less than 12,000 working drawings sent into the workshop, to say nothing of the innumerable sketches and details prepared before the final details were decided upon. The total thrust upon the foundations is 565 tons, not including the effect of wind, and 875 tons, under a maximum wind pressure.

The tower is painted of a rich chocolate color, the tone of which is lightened from the base toward the summit. The painting, which was of itself a considerable work, is very effective, especially when lighted by the sun. But little decoration has been attempted; it would have been wasted labor and expense. The level of the first story is marked by a bold frieze, on the panels of which, around all four faces of the tower, are inscribed in gigantic letters of gold the names of the famous Frenchmen of the present century who have most contributed to the advancement of science. Above this frieze the four-sided arcade covering the exterior gallery, is elaborately decorated, and considerable sketches and details taken to this feature as marrying the bold and graceful outline of the tower. A similar arcade encircles the tower at the level of the second story, and the same objection may be raised with regard to it, but with less force, because the great height makes the arcade look insignificant. The sloping arches and spandrel fillings which connect the columns of the tower on the four faces beneath the first story are singularly well adapted to the gigantic scale of the work.

There are three systems of elevators to be used in the tower. From the ground to what may be called the first story, where great restaurants will be established, there will be four elevators, two of the Otis pattern and two of the system of Roux, Combaluzier, and Lepape, in which the car is elevated by means of a jointed piston, which has been compared to a vertical column. From this story to the next one, about 400 feet from the ground, the Otis elevators only are employed in two of the legs of the tower. The cars of the French system in the two bottom lifts are adapted to carry one hundred passengers each, while the cars of the Otis elevators carry only fifty each, but their speed is double that of the others. The top lift, a vertical distance of 493 feet, is made by elevators on the Edoux system, in which the carriage is worked by an enormous piston. To go above this distance to the lantern will have to climb a spiral staircase.

The total height of the tower is 984.24 feet, or 300 meters, but the inclined or curved part of the legs considerably increases the length of travel of the elevators in these portions, a vertical height therein of 372 feet making an actual length of the curved part of 493 feet. The angle of inclination in this portion varies from 54° at the start to about 80° at the finish, but the carriages are so hung as to always accommodate themselves to the varying angle, so that their floors will be kept even. The steps leading to the different landing places are made to fold up when the car is traveling.

The great hydraulic cylinder of the Otis elevator, which is placed in the foot of the tower, perpendicularly to the cross-pieces and 38 inches in diameter and 41 feet long, while the circulating piston, valve, and water chest are all 9 inches in diameter. In this cylinder is a piston fed with water from reservoirs placed on the stage where the vertical portion of the tower commences, or at a vertical height of 372 feet above the lower end of the cylinder. The piston rod operates on a carriage bearing guide-wheels and multiplying pulleys, cables thence connecting with stationary multiplying pulleys, and the carriage being suspended by six ropes of steel wire. One of these ropes alone is designed to have sufficient strength to bear the carriage full of passengers without breaking. The carriage is partly counterbalanced, and rises or falls twelve feet for one foot movement of the piston. Under the cabin is a safety brake, with the jaws working automatically in case of rupture or of the elongation of one of the ropes.

The highest structures of ancient times are the pyramids of Old Egypt, the highest and best preserved of which are the pyramid of Cheops, near Ghizeh (450 feet high), and that of Chephren (448 feet high). Both of these are less than half as high as the Eiffel tower. Heretofore the highest building in Europe was the Cologne cathedral (about 523 feet high), and the highest in America, the Washington Monument (about 555 feet high). Both are greatly surpassed in height by the Eiffel tower.

EIFFEL TOWER.

10 ft. thick under the western pier on the Grenelle side, and nearly 20 feet thick under the north pier on the Paris side. Apart, therefore, from the difficulties in sinking for the foundations, the conditions were very satisfactory. The mode of sinking adopted was that of compressed air, with iron caissons 40 ft. 2 in. long by 19 ft. 8 in. wide; four such caissons were required for each pier, and they were sunk to a depth of 40 ft. below the surface, or 16 ft. lower than the Seine mean water level.

The tower terminates at a height of 896 feet above the ground, with a platform about 53 feet square. The width of the column at this level is 33 feet, the gallery being carried by brackets which are sufficiently wide to afford a considerable area of platform. It is almost unnecessary to state that this space is securely protected by a railing and glass to prevent any voluntary or involuntary catastrophe. Above the platform rises the campanile, which is of the design shown; in the lower part of this is established a spacious and very completely fitted laboratory, closed to the public and intended for the prosecution of scientific research and observation. Four latticed arched girders rise diagonally from each corner of the lower part of the campanile and unite at a height of about 54 feet above the platform. By means of a spiral staircase yet another gallery is reached, about 19 feet in diameter, and surrounding the lantern which crowns the edifice and brings the height of the structure to 984 feet. Above this rises the great lightning conductor. Within the lantern, which is 22 feet high, will be placed a very powerful electric light, placed within a lantern of the first order, and

EIFFEL, GUSTAVE, a French engineer, the designer and builder of the Eiffel Tower, Paris, born in Dijon, France, in 1832. He made the framework of Bartholdi's *Liberty*, and constructed the *Grand Vestibule*, and the principal façade of the Paris Exposition of 1876, a work costing 3,000,000 francs. Another of his principal works is the bridge at Oporto, on the Lisbon railway, one of the finest specimens of engineering skill in Europe, and the railway viaduct of Garabet over the valley of Truyère, France, costing 3,248,000 francs. In this case the opening of the arch is 165 meters, and the height above the water is 124 meters. He has also constructed several other railway bridges and aqueducts of note, as the bridges of Szeged, Hungary, 606 meters long, and the bridge at Vienna, Portugal, 736 meters long. In January, 1893, he was tried and convicted of misappropriating funds belonging to the Panama Canal Company and was sentenced to fine and imprisonment.

GUSTAVE EIFFEL.

EIFFEL, or EIFEL, THE, a barren and bleak plateau of Rhenish-Prussia, located between the rivers Rhine, Moselle and Roer, and showing extensive traces of volcanic activity. Its surface, which ranges at an average altitude of 1,500 to 2,000 feet, is for the most part broadly undulating, and diversified by crater-like depressions and volcanic peaks and ridges, whilst toward its edges it is seamed by deep, wooded, rocky ravines. Its highest and at the same time most inhospitable parts are in the west and northwest, whence it falls away gradually to the Rhine on the east and to the Moselle on the south. The central portion of the plateau is crossed by a range of basaltic summits, the loftiest in the Eiffel system, including the Hohe Acht (2,494 feet) Nurburg (2,255) and Kellberg (2,211). The ridges of the northwest are connected by the Hohe Venn with the Ardennes. Geologically, the basement of the plateau belongs to the Lower Graywacke of the Devonian formation, with eruptions of Eifel limestone, parts of which are rich in

fossils. Above this are deposited, with tolerable regularity in a horizontal position, strata of Triassic age, containing considerable quantities of metallic ores, especially zinc and lead. The Eiffel was for a long period the scene of volcanic activity; zones and islands of basalt are frequent, as also eruptive masses of basaltic lavas, with tufa and pumice. With the exception of the vine and fruit trees on the east and south edges of the plateau, and a little agriculture (up to 1,700 feet), the Eiffel is uncultivated, its rocky soil being too poor and its climate too raw and bleak for anything to grow but heather.

EIGHT, PIECE OF, a name once popularly given to the Spanish dollar, as being divided into eight reals.

EIK: in the legal phraseology of Scotland, an addition made to a document for the purpose of meeting circumstances which have subsequently arisen.

EIRE, EYRE, JUSTICES IN (corruption of *Latin itinere*). By this term, both in England and Scotland, were the judges of assize formerly designated. Justices in eire were first established in England by the statute of Northampton (1176 A. D.), in the reign of Henry II. At first, they made the circuit of the kingdom once in seven years; but by Magna Charta, c. 12, the chief Justices are directed to send justices through every county once in the year. The term is still in use in Scotland, where, at the commencement of every circuit, proclamation is made to the lieges to attend the "circuit eire."

EISENERZ, a small town of Austria, in the north of the province of Styria, 20 miles west-northwest of Bruck. It is worthy of mention only for its connection with the Erzberg (ore mountain), at the southern base of which the town lies. This mountain, which is about 2,840 feet high, and about five miles in circumference at the base, is literally a solid mass of iron ore, of a quality so rich, that, instead of cutting mines into it and following the metal in veins—which process was formerly adopted here—the top and sides of the rock are quarried from the outside, and the ore is then broken small, and conveyed to the smelting-house without further preparation. Mines have been worked on this mountain for upwards of 1,000 years.

EISENLOHR, AUGUST, German Egyptologist, born at Mannheim, Oct. 6, 1832. He studied theology at Heidelberg and Göttingen, and afterwards devoted considerable attention to natural science, especially chemistry. About 1865 he became interested in the study of Egyptian hieroglyphics, and in 1869 became instructor in Egyptology at the University of Heidelberg. Being sent by the Grand Duke of Baden to Egypt, he ascended the Nile to the second cataract, and returned through Palestine, Syria, and Asia Minor. In 1872 he was made professor extraordinarius in the University of Heidelberg. He has made valuable translations of papyri belonging to the British Museum.

EKA, in chemical nomenclature, is prefixed to the name of a known element to indicate a hypothetical element supposed to stand next to it in the same group. Thus, gallium, previous to its actual discovery, was provisionally named by Mendelejeff eka-aluminium.

EKATERINOGRAD, a town and fortress in the South of Russia, in the Government of Caucasus, situated on the left bank of the Terek, in lat. 40° 43' N., and long. 44° 3' E. It is an important military post of the Cossacks. A stone triumphal arch was erected at Ekaterinograd by Catherine II, in mem-

ory of Prince Potemkin, who founded the town in 1777.

EKOWE, the capital of the territory of Zululand. ELÆAGNUS, a genus of *Elæagnaceæ*, the oleaster family, of which there are about thirty-five species, all natives of north temperate countries. *Elæagnus angustifolia*, the oleaster, sometimes called wild olive, is a small spiny tree of the Mediterranean region, hoary with stellate hairs, and is frequently planted for its silvery white foliage and fragrant flowers.

ELÆOCARPACEÆ, a sub-order of *Tiliaceæ*, mostly East Indian trees. The fruits of some are eaten and the deeply-wrinkled stones, often called olive nuts, are made into beads for necklaces and bracelets in India.

ELÆOCOCCA, a genus of *Euphorbiaceæ*, the seeds of some of which yield useful oils. The oil obtained from *Elæococca verrucosa* is used for food in Japan, notwithstanding considerable acidity. The tree is cultivated in the Mauritius, and the oil is there used only for burning. That obtained from *Elæococca vernicia* of China is used in painting.

ELEODENDRON, a genus of trees of the natural order *Celastraceæ*, having a 5-partite calyx, 5 petals, a 5-angled disc, 5 stamens, the ovary immersed in the disc, and a drupaceous fruit. *Eleodendron glaucum*, a native of Ceylon and the South of India, is sometimes called the *Ceylon Tea-tree*, from the resemblance of its leaves to those of the tea-shrub. The timber of *Eleodendron croceum*, called *saffronwood* at the Cape of Good Hope, is much used there in building and cabinet-making; it is fine-grained, hard and tough. The fruit of *Eleodendron Kubu*, another South African species, is eaten by the colonists. That of *Eleodendron argan* yields an oil similar to olive oil, much used by the Moors.

ELANET (*Elanus*), a genus of *Falconidæ*, allied to the kites (see *Britannica*, Vol. XIV, p. 104), which they resemble in many of their characters; but from which they differ in having the short tarsi half covered with feathers, and the claws, except that of the middle toe, rounded beneath. The tail is very little forked. One species (*Elanus melanopterus*) is common in Africa, from Egypt to the Cape of Good Hope, and is found also in India. Another species is the black-shouldered hawk (*Elanus dispar*) of America, the northern limit of which appears to be South Carolina. Both of these feed chiefly on insects, which they catch on the wing, but they also prey on small birds and reptiles.

ELASTIC TISSUE, known also as yellow fibrous tissue, derives its name from the remarkable physical property which it possesses of permitting its fibers to be drawn out to double their length, and again returning to their original length. It occurs in various ligamentous and other structures of the animal body in which elasticity is required—as, for example, in the vocal chords, the membranes connecting the cartilaginous rings of the trachea, the middle coat of the arteries, the skin, etc.

ELATER, a Linnæan genus of coleopterous insects, now divided into many genera, and forming the tribe or family *Elateridæ*. They have a narrow elongated body; the head is in almost all cases inserted deeply into the thorax; a strong spine on the under part of the thorax at its base fits into a groove; the legs are short and rather slender. They are generally found upon the flowers and leaves of plants, which are their food. See *Britannica*, Vol. VI, p. 132.

EL BASSAN, a town of Turkey, in central Albania, 75 miles south-southeast of Scutari, with

manufactories of copper and iron wares. It is the seat of a Greek bishop. Population, 8,000.

ELBOW-PIECES: in armor, or *coudières*, the metal plates used to cover the junction of the rerebrace and vant-brace, by which the upper and lower half of the arm were covered.

ELDER, WILLIAM HENRY, born in Baltimore in 1819, educated at the College of the Propaganda in Rome, became Roman Catholic bishop of Natchez in 1857. In 1880 he became coadjutor archbishop of Cincinnati, and two years later, on the death of Archbishop Purcell, he became archbishop.

EL DORADO, city and county-seat of Butler county, Kan., situated on Walnut River. It has waterworks, gas, and electric lights, woolen and flour mills, machine shop, iron foundry, and extensive quarries. Pop. (1890), 3,339.

ELDORADO SPRINGS, a popular health resort of Missouri, located in the northwestern part of Vernon county. It is a rapidly growing town, its popularity being due to the presence of several springs, whose waters are chalybeate.

ELDRED, a railroad junction of McKean county, Pa., 24 miles east of Bradford.

ELECTION, in theological language, denotes the divine act by which certain individuals are chosen to salvation in Christ. It is defined in the seventeenth of the thirty-nine articles.

ELECTION LAWS OF THE UNITED STATES. Under the Federal Constitution the jurisdiction of the election laws of the United States extends only to the elective officers of the Federal Government. These are the President, Vice-President, and members of the House of Representatives. The State legislatures determine severally the qualifications for voting in those States.

All the States except Wyoming restrict the right to vote at general elections to males of 21 years of age and upwards. In Wyoming women have voted on the same terms with men since 1870. They requested the constitutional convention to guarantee suffrage to them in 1889. This was done with practical unanimity in convention and at the polls. As Congress declared that it "accepted, ratified and confirmed" this constitution, women have the full right of suffrage in Wyoming. In Kansas women have suffrage on the same terms with men in all municipal elections; and in Delaware municipal suffrage is accorded them in many places, school suffrage being universal throughout the State. In Montana women have the right to vote on questions of local taxation. In Washington Territory women voted generally for five years, and then were excluded by decision of the Territorial Supreme Court. In adopting a State Constitution the women were not permitted to vote, and the woman suffrage clause was defeated. The women assert that they were illegally prevented from voting, and have appealed to the United States Supreme Court. In Utah women voted until excluded by the Edmunds law. In Pennsylvania women can vote on local improvements, by signing or refusing to sign petitions therefor. In New York women can vote at school elections, at water-works elections, and on questions of paving, grading, drainage, street lighting, and other local improvements. The right to vote at school elections is also accorded to women, on various terms, in Arizona, Colorado, Idaho, Indiana, Kansas, Kentucky, Massachusetts, Michigan, Minnesota, Nebraska, New Hampshire, New Jersey, North Dakota, Oregon, South Dakota, Texas, Vermont, Washington and Wisconsin. In Arkansas and Missouri women vote (by signing or refusing to sign petitions) on granting liquor licenses.

QUALIFICATIONS OF VOTERS IN THE SEVERAL STATES.

States.	Requirements as to Citizenship.	Previous Residence Required.				Persons Excluded from Suffrage.
		In State.	In County.	In Town.	In Precinct.	
Alabama.....	Citizen of United States or alien who has declared intention.	1 year.	3 mos..	30 days	30 days	Convicted of treason or other crime punishable by imprisonment, idiots, or insane.
Arkansas.....	Citizen of United States or alien who has declared intention.	1 year.	6 mos..		1 mo..	Idiots, insane, convicted of felony, until pardoned.
California.....	Citizen by nativity, naturalization, or treaty of Quere-taro.	1 year.	90 days		30 days	Chinese, insane, embezzlers of public moneys, convicted of infamous crime.
Colorado.....	Citizen or alien who has declared intention 4 months previous to offering to vote.	6 mos..	90 days		10 days	Convicted of felony and unre-stored to citizenship.
Connecticut.....	Citizen of United States who can read constitution or statutes.	1 year.		6 mos..		Convicted of any offense for which infamous punishment is inflicted.
Delaware.....	Citizen, and paying county tax after age 22.	1 year.	1 mo..		15 days	Idiots, insane, paupers, felons.
Florida.....	Citizen of United States or alien who has declared intention, who has paid capitation tax 2 years.	1 year.	6 mos..		(a)	Insane, under guardianship, convicted of felony, or any infamous crime.
Georgia.....	Citizen of the United States..	1 year.	6 mos..			Idiots, insane, convicted of crime punishable by imprisonment.
Idaho.....	Citizen of the United States..	6 mos..	30 days			Chinese, Indians, Mormons, felons, insane, convicted of bribery.
Illinois.....	Citizen of the United States..	1 year.	90 days	30 days	30 days	Convicted of crime punishable in penitentiary until pardoned and restored to rights.
Indiana.....	Citizen of United States or alien who has declared intention and resided one year in United States and 6 months in State.	6 mos..		60 days	30 days	Convicted of crime and disfranchised by judgment of the court.
Iowa.....	Citizen of the United States..	6 mos..	60 days		(a)	Idiots, insane, convicted of infamous crime, United States soldiers and marines not bona fide residents.
Kansas.....	Citizen of United States or alien who has declared intention.	6 mos..			30 days	Idiots, insane, convicts, rebels, public embezzlers, bribed.
Kentucky.....	Citizen.....	2 yrs*..	1 year.		60 days	Convicted of robbery, forgery, counterfeiting or like crime.
Louisiana.....	Citizen of United States or alien who has declared intention.	1 year.	6 mos..		30 days	Idiots, insane, convicted of treason, embezzlement of public funds, all crime punishable by imprisonment in penitentiary.
Maine.....	Citizen of the United States..	3 mos..	3 mos..	3 mos..		Paupers, persons under guardianship, Indians not taxed.
Maryland.....	Citizen of the United States..	1 year.	6 mos..		1 day..	A person over 21 years convicted of larceny or other infamous crime, unless pardoned, persons under guardianship, as lunatics or non compos mentis.
Massachusetts.....	Citizen who can read Constitution in English, write, and has paid tax within 2 years.	1 year.		6 mos..	30 days	Paupers (except honorably discharged U. S. soldiers and sailors) and persons under guardianship.
Michigan.....	Citizen or inhabitant who has declared intention under U. S. laws 6 months before election.	3 mos..		10 days	10 days	Aliens who have not declared intention 6 months previous to election, Indians, duelists and accessories.
Minnesota.....	Citizen of United States or alien who has declared intention, and civilized Indians.	4 mos..	10 days		10 days	Convicted of treason or felony, unless pardoned, persons under guardianship or insane.
Mississippi.....	Citizen of the United States who can read or understand Constitution after January 1, 1892.	2 yrs... 1 year.			1 year.	Insane, Indians not taxed, felons, persons who have not paid taxes.
Missouri.....	Citizen of United States or alien who has declared intention not less than one year or more than five before offering to vote.	1 year.	60 days	60 days		U. S. soldiers and marines, paupers, criminals convicted once until pardoned, felons and violators of suffrage laws convicted a second time.

*Unless there has been one year's previous residence in the county. +Australian Ballot Law or a modification of it in force. †And one year's residence in United States prior to voting. (a) Actual residence in the precinct or district required.

QUALIFICATIONS OF VOTERS IN THE SEVERAL STATES—Continued.

States.	Requirements as to Citizenship.	Previous Residence Required.				Persons Excluded from Suffrage
		In State.	In County.	In Town.	In Precinct.	
Montana†.....	Citizen of the United States..	1 year.	30 days	30 days	30 days	Indians, felons not pardoned.
Nebraska.....	Citizen of United States or alien who has declared intention thirty days prior to election.	6 mos..	40 days		10 days	Idiots, insane, convicted of treason or felony, unless pardoned.
Nevada.....	Citizen of the United States..	6 mos..	30 days			Idiots, insane, convicted of treason or felony, unarmisted Confederates who bore arms against the United States.
New Hampshire.....	Inhabitant, native or naturalized.	6 mos..		6 mos..		Paupers (except honorably discharged U. S. soldiers and sailors), persons excused from paying taxes at their own request.
New Jersey†.....	Citizen of the United States..	1 year.	5 mos..			Idiots, insane, persons convicted of crimes (unless pardoned), which exclude them from being witnesses, which crimes include blasphemy, treason, murder, rape, sodomy, arson, perjury, etc.
New York†.....	Citizen who shall have been a citizen for ten days.	1 year.	4 mos..		30 days	Convicted of bribery or any infamous crime, unless pardoned, bettors on result of any election at which they offer to vote, bribers for votes and the bribed.
North Carolina.....	Citizen of the United States..	1 year.	90 days			Convicted of felony or other infamous crime.
North Dakota.....	Citizen of the United States, alien who has declared intention and civilized Indian*	1 year.	6 mos..		90 days	United States soldiers and sailors, persons <i>non compos mentis</i> , and felons.
Ohio.....	Citizen of the United States..	1 year.	30 days		20 days	Felony until pardoned and restored to citizenship, idiots, insane.
Oregon.....	Citizen of United States or alien who has declared intention one year preceding election.	6 mos..				Idiots, insane, convicted of felony, United States soldiers and sailors, Chinese.
Pennsylvania.....	Citizen of the United States at least one month, and if 22 years old or more must have paid tax within two years.	1 year†.			2 mos..	Convicted of some offense whereby right of suffrage is forfeited, non-taxpayers.
Rhode Island.....	Citizen of the United States..	2 years		6 mos..		Paupers, lunatics, persons <i>non compos mentis</i> , convicted of bribery or infamous crime until restored to right to vote, under guardianship.
South Carolina.....	Citizen of the United States..	1 year.	60 days			Convicted of treason, murder, or other infamous crime, or of dueling, paupers, insane.
South Dakota.....	Citizen of the United States or alien who has declared intention.	6 mos. §	6 mos..		30 days	Under guardianship, idiots, insane, convicted of treason or felony, unless pardoned.
Tennessee†.....	Citizen of the United States..	1 year.	6 mos..		(a)	Convicted of bribery or other infamous offense.
Texas.....	Citizen of the United States or alien who has declared intention.	1 year.	6 mos..		(a)	Idiots, lunatics, paupers, supported by county, convicted of felony, United States soldiers and seamen in service.
Vermont†.....	Citizen of the United States..	1 year.		6 mos..		Unpardoned convicts and deserters from United States military or naval service during civil war, ex-Confederates.
Virginia.....	Citizen of the United States..	1 year.	3 mos..	3 mos..	30 days	Idiots, lunatics, convicted of bribery at election, embezzlement of public funds, treason, felony and petty larceny, duellists and abettors, unless pardoned by legislature.
Washington†.....	Citizen of the United States..	1 year.	90 days		30 days	Indians not taxed.
West Virginia.....	Citizen of the State.....	1 year.	60 days		(a)	Paupers, persons of unsound mind, convicted of treason, felony or bribery at elections.
Wisconsin†.....	Citizen of the United States or alien who has declared intention.	1 year.			10 days	Insane, under guardianship, convicted of treason or felony, unless pardoned.
Wyoming.....	Citizen of the United States or alien who has declared intention.	6 mos..	30 days			Under guardianship, idiots, insane, unpardoned felon, bettors on elections.

*Indian must have severed tribal relations two years next preceding the election. †Australian ballot law or a modification of it in force. ‡Or if, having previously been a qualified elector or native, he shall have removed and returned, then 6 months. §One year's residence in the United States prior to election required. (a) Actual residence in the precinct or district required.

REGISTRATION.

Voters are required to register in Alabama, California, Colorado, Connecticut, Florida, Louisiana, Maine, Maryland, Massachusetts, Mississippi, Nevada, New Hampshire, North Carolina, Pennsylvania, South Carolina, Vermont and Virginia. In Georgia registration is required in a few counties; in Iowa, Kansas and Nebraska, in all cities. In Illinois registration is required, but, except in a few cities, a legal voter not registered may vote upon filing an affidavit by himself and another known legal voter that he is a qualified voter and has not already voted. In Minnesota registration is required in all cities of 1,200 inhabitants or over; in Missouri, in cities of 100,000 inhabitants and over; in New Jersey, in cities of over 10,000 inhabitants; in Wisconsin, in cities of 20,000 inhabitants or over; in Ohio, registration is generally required. Registration is not required in Arkansas, Delaware, Indiana, Kentucky, Oregon, Tennessee, Texas and West Virginia. It is prohibited in Arkansas, Texas and West Virginia by the constitution. In New York, voters in cities must register personally; in all other places within the State they may register on the first two registration days by proxy.

ELECTORAL COMMISSION, a special commission appointed by act of the United States Congress approved Jan. 29, 1877, for the purpose of determining the electoral votes of the States of Florida, Louisiana, and South Carolina and of one vote of the State of Oregon, in the Presidential election of November, 1876. The commission consisted of United States Supreme Court Justices Clifford, Strong, Miller, Field and Bradley; United States Senators Edmunds, Morton, Frelinghuysen, Thurman and Bayard, and United States Representatives Payne, Hunton, Abbott, Garfield, and Hoar.

The question before the commission was of the gravest national interest. Its answer would practically decide the choice of the nation with regard to the ensuing Presidential administration. The appointment of the commission was the result of prolonged discussion in both houses of Congress, and this plan of averting an impending evil was reported by a joint committee, representing not only both the Senate and House of Representatives, but also most equably the two great political parties. This joint committee was composed of Senators Geo. F. Edmunds, of Vermont; Frederick T. Frelinghuysen, of New Jersey; Roscoe Conkling, of New York; Allen G. Thurman, of Ohio; Thomas F. Bayard, of Delaware, and Oliver P. Morton, of Indiana. Also of Representatives Henry B. Payne, of Ohio; Eppa Hunton, of Virginia; Abram S. Hewitt, of New York; William Springer, of Illinois; Geo. W. McCrary, of Iowa; Geo. F. Hoar, of Massachusetts, and Geo. Willard, of Michigan. Of this committee seven were Republicans and seven were Democrats. The committee reported the bill Jan. 18, 1877, and, with the exception of a single dissident (Senator Morton), by a unanimous recommendation. The bill provided for the creation of the Electoral Commission, to be composed of five Sen-

ators, five Representatives, and five Associate Justices of the United States Supreme Court, four of the latter being designated by their districts in the bill itself, the fifth to be chosen subsequently by those four. All certificates and other documents from the contesting parties, and all questions relating to the powers of Congress in the premises (with the authority to exercise the same powers in ascertaining the legal vote of each State) were to be referred to this commission as a tribunal; and the decision in each case to stand as final, *unless rejected by the concurrent vote of both houses of Congress*. The bill also provided that objections that might be made to any electoral votes from States not presenting double certificates should be considered not by the commission but by the houses separately, and unless sustained by both should be of no effect.

The bill thus reported with such remarkable unanimity was submitted to extended discussion in both houses, resulting in its adoption by the Senate, Jan. 25, by a vote of 47 yeas to 17 nays (the Republicans 24 yeas to 16 nays, and the Democrats 23 yeas to one nay); absent or not voting, nine Republicans and one Democrat. The vote was taken in the House, Jan. 26, resulting in the adoption of the bill by a vote of 191 yeas to 86 nays (the Democrats 158 yeas to 18 nays, and the Republicans 33 yeas to 68 nays); absent or not voting, seven Republicans and seven Democrats.

As a majority of the Senate was Republican, and a majority of the House Democratic, it was agreed that three Republicans and two Democrats should be selected from the Senate and three Democrats and two Republicans from the House. Of the United States Supreme Court Justices the four, as stated above, were designated in the report of the joint committee, namely: Justice Clifford, of Maine; Justice Miller, of Iowa; Justice Field, of California, and Justice Strong, of Pennsylvania. These four appointed, as the fifth, Justice Joseph P. Bradley, of New Jersey.

The commission perfected its organization Feb. 1, 1877, and closed its work Feb. 27, and its decision was reported at the joint electoral convention of the two houses of Congress held March 1, resulting in the announcement early the next morning that Rutherford B. Hayes, of Ohio, and William A. Wheeler, of New York, had been elected, respectively, President and Vice-President of the United States.

ELECTORAL CROWN, or, more properly, CAP, was a scarlet cap, turned up with ermine, which was worn by the electors of the German Empire. It was closed with a demi-circle of gold, covered with pearls, and on the top was a globe with a cross on it, also of gold.

ELECTRICITY

FOR the general subject of electricity, and an elaborate and exhaustive discussion of the methods of applied electricity, brought down to the year 1878, see *Britannica*, Vol. VIII, pp. 3-105; also see *TELEGRAPH*, Vol. XXIII, pp. 112-126. It is only required in these Revisions and Additions that a record should be outlined of the later discoveries and progress in electrical science, and especially in applied electricity.

ELECTRIC LIGHTING.—The principal uses to which electricity is put to-day, outside the all-important classes of electric signaling and electro-chemical work, are for furnishing light, heat, and power; and of these three applications that of electric lighting is perhaps the most important. There are two kinds of lamps in use, entirely dissimilar in principle and construction, and used for entirely different purposes.

In one, known as the "arc" light, the light is obtained by causing a heavy current of electricity to cross a small space, taking a slightly curved path, called the electric arc, from which its name is derived. This is the intensely brilliant light used for street lighting. In the other, known as the "incandescent," the light is produced by passing a small current through a fine wire or filament, which it heats to a dazzling brilliancy or incandescence.

The arc light, which is much older than the incandescent, is now produced practically by passing a powerful current between the points of two large carbon rods, which are kept close together by an automatic mechanism known as the regulator of the lamp. The space allowed between the tips of the rods, across which the current jumps, is about one-sixteenth of an inch, and the

duty of the regulator is to move one of the rods toward the other as fast as the tips are burned off by the intense heat, keeping the space to be jumped by the current as nearly uniform as possible. The carbon rods are placed perpendicularly, one above the other. The electric current, after reaching the upper carbon, passes across the tips and through the lower carbon, thence through a wire which is wound around a magnet, thence to the continuation of the line, and on to the next lamp. This magnet attracts a lever which, when raised, grasps the upper carbon through the agency of a washer which allows the carbon to slide downward through it except when it is tilted by the action of the magnet and lever. The upper carbon is arranged in suitable guides to slide straight up and down, and the lower carbon is held stationary. When at rest the washer lies flat, and the upper carbon slides down until in contact with the lower one. When the current is turned on it passes across the tips of the carbons, which at first are in contact, and around the magnet, causing it to raise the lever, tilt the washer till it grasps the carbon, and thus elevates the movable carbon until the increased length of the space between the tips weakens the current and checks the lifting action of the magnet. The light then

burns steadily until enough of the tip is burned off to further weaken the current by increasing the space, when the magnet, being no longer able to support the carbon, lowers it enough to re-adjust the space.

WOOD DYNAMO.

So long as the source of power for producing the electricity was the galvanic battery, experience of this promising illuminator only served to lay bare its practical defects. It was found to be unsteady, flickering, and unreliable, and although great ingenuity was displayed in producing electric lamps but little real progress was made. The first magneto-electric machine, the forerunner of the dynamos of the present day, was exhibited at the French Académie des Sciences in 1832. With this machine sparks and strong shocks were obtained, water decomposed, etc. In 1841 Wheatstone pat-

SLATTERY INCANDESCENT DYNAMO.

ented a plan by which more powerful effects could be obtained by combining several machines together. The next important advance was made in 1866, when H. Wilde, of Manchester, Eng., announced the somewhat paradoxical principle that a current or magnet indefinitely weak could be made to pro-

duce a current or a magnet of indefinitely great strength. Carrying out this principle, Wilde constructed a very powerful machine, which, turned by a steam engine, produced such a powerful electric current that an iron rod 15 inches long and a quarter of an inch thick was melted, and an electric light produced between carbon points of an intensity sufficient to cast shadows from the flames of ordinary gas burners a quarter of a mile distant from the source of light. The "reaction" principle in magneto-electric machines was discovered the same year (1866). In the machine of Wilde, the starting point of the source of power was a permanent steel magnet, but in the reaction principle the residual magnetism which is always found more or less in soft iron was made use of to originate the electric current. This principle has been far-

reaching in its results, and upon it all the numerous "dynamoes" of the present day are worked.

In 1870 another important advance in "dynamo-electric" machines was made by Z. T. Gramme, of Paris. Gramme's machine involved the new principle of forming the movable part of the machine of an endless ring of soft iron round which was coiled a series of bobbins of wire, all connected together. By this invention a nearer approximation to a continuous electric current was obtained than by any previous form of machine. After this, invention followed invention, step by step, each one perfecting the dynamo machine more and more, so that not only were these machines made more compact and better generally in design, but the electric power obtained from them for a given amount of horse power used to drive them continually,

IMPROVED DYNAMO.

also approached nearer the theoretical limit, until but little further improvement seems possible except in small matters of detail.

While the dynamo was thus being gradually developed towards theoretical perfection, regard was also had to the bettering of the carbon points or luminous electrodes of the light. The wasting of the carbon points necessitated a contrivance for regulating the distance between the points so as to keep the arc of sensibly constant width. In 1876, P. Jablochhoff, a Russian, introduced a modification of the arc lamp by which all regulating mechanism was dispensed with. The invention was called an electric "candle," and promised very great things. In spite, however, of the progress made in "arc" electric lighting, the general results were not completely satisfactory except for special purposes, and it is difficult to say what the fate of

such lighting would have been; but in September, 1878, Thomas E. Edison, of New York, announced his discovery of a method of dividing the electric light, so as to obtain from a given current many lights of moderate power in the place of one of excessive brightness. He constructed an incandescent electric lamp, or glow lamp, in which the current is made to pass through a strip of some substance, which, because of its high resistance, becomes highly heated, and hence brilliantly incandescent. He employed for this substance carbon in the form of a thin strip or wire, carefully prepared for the purpose and bent in a loop, inclosed in a bulb of glass from which the air had been exhausted. The vacuum prevented the consumption of the carbon at the high temperature to which it was raised. These lamps are readily applied to the existing gas fixtures at moderate cost, and

mark an important era in the progress of electric lighting. The demand for incandescent lamps has

INCANDESCENT LAMP.

been enormous, so that at the present time there are over 3,000,000 in use in the United States.

PORTABLE ELECTRIC LAMP.—A device intended for street or lawn lighting at points where an electric lighting current is not accessible, is among the recent inventions in electrical apparatus. The device comprises, as will be understood from an inspection of the illustration, a case or stand provided with shelves, upon which a series of secondary battery cells may be mounted, and carries a bracket, to which is secured an incandescent lamp. The device is controlled by a time switch so that the circuit may be closed and the lamp lighted at any desired hour. The case is provided with a door in which is arranged a bull's-eye, through which the clock may be seen when the door is closed. The apparatus when completed weighs about 200 pounds, which gives it sufficient stability for the purposes for which it is designated.

Another form of portable electric lamp, illustrated in the accompanying cut, was exhibited at a recent electrical exhibition in Paris by M. Laroche. The battery is inclosed in the lower part, and consists of an ebonite vessel divided into eight compartments by partitions, furnishing eight cells, or elements, in a very compact form. The vessel will hold about three liters of liquid, capable of acting for about eight hours without exhaustion. Each element is made up of a rod of zinc and two rods of carbon fixed to a disk which can be lowered into the liquid, or lifted out of it, by turning a key

PORTABLE ELECTRIC LAMP.

PORTABLE ELECTRIC LAMP.

like that used in a Carcel oil-lamp. The power of the lamp is regulated by the depth to which the zincs and carbons are immersed. The zincs are screwed into the disk so as easily to be removed for renewal.

THE ELECTRIC LIGHT IN MICROSCOPY.—The incandescent electric light is very highly recommended as a substitute for the usual lamps used in microscopy, or even for the direct daylight. A small lamp, which only requires one cell of a bichromate battery to operate it, and which can be adjusted to any position, is now made for this purpose. Among the advantages of the electric light are its intensity, which allows the use of very oblique rays in illuminating the object; the larger proportion of white and blue rays in the light, which

ELECTRIC LIGHT IN MICROSCOPY.

bring out the finer details more clearly; the small amount of heat given out, which enables the lamp to be placed as close to the condenser of the microscope as may be desired; and the doing away with the necessity of a mirror to reflect the light upon the object, since the lamp can be placed in any desired position in reference to it. It is also claimed that the light is less fatiguing to the eye than even ordinary daylight; while, for purposes of micro-photography, the large proportion of actinic rays in the electric light and the ease with which it can be regulated render it far superior to any other illuminant.

EXAMINING THE STOMACH BY ELECTRIC LIGHT.

ILLUMINATING THE STOMACH BY ELECTRIC LIGHT.—Medical electricians have recently devised a plan by which the interior of the human stomach may

be illuminated for examination. The patient is laid upon the operating table, and a slender tube carrying a glass bead upon its end is introduced into the stomach. A small light inside the bead is supplied by fine wires running out through the tube and connected to a small battery. The interior of the stomach is plainly lighted, and all its parts are brought into view by a small movable mirror at the end of the tube.

CAUTERY WIRE HEATED BY ELECTRICITY.

CAUTERY WIRE HEATED BY ELECTRICITY.—Another application of electricity for physicians is the electro-cautery shown in the accompanying illustration, by which the principle of electric heating is applied to surgical operations. The instrument consists of a loop of fine platinum wire mounted in a rubber handle, through which connecting wires pass. These wires are led to a battery, the current from which follows the wires, and keeps the platinum loop white-hot. The heat is inside the wire, as it were, and can be regulated to any intensity, and kept there during an operation without withdrawing the instrument for reheating.

ELECTRIC LIGHTS FOR CARRIAGES.—In Paris numerous private carriages are now fitted up with incandescent electric lamps, instead of the old-fashioned candles or oil lamps. Not only are the regular side-lights thus arranged, but the interior of the vehicle is also illuminated by a lamp sufficiently powerful to read by; and a similar lamp is sometimes placed on the head of the horse, producing a very brilliant and "stylish" effect. These lamps are connected by wires with small accumulators placed under the driver's seat. These accumulators are only about eight inches square and four inches high, and each one will supply a lamp of 5-candle power for six hours. During the day they are removed, charged with electricity from a dynamo-machine or otherwise, and at night they are ready for service.

EDISON GENERATOR.

ELECTRIC LIGHT AND PLANTS.—At the Winter Palace, St. Petersburg, Russia, there is a noted collection of ornamental plants, especially of fine palms, grown for decoration of the banqueting halls of the palace. Since the introduction of the electric light these plants have been greatly injured. The illumination of a room for a single

night will cause the leaves to turn yellow, dry up, and finally fall off. The days in winter at St. Petersburg are almost sunless, and the sudden change from this dim light to the blinding glare of the electric lights is more than the plants can bear. Plants that are partly shaded escape injury to their foliage.

SUBMARINE TELEGRAPHY.—The first submarine cable was laid across the English Channel, from Dover, England, to Calais, France in 1850. Being unprotected it lasted but a few hours. The connecting wires (27 miles long) were placed on the government pier in Dover harbor, and in the *Goliath* steamer were coiled about 30 miles in length of telegraphic wire, inclosed in a covering of gutta-percha, half an inch in diameter. The *Goliath* started from Dover, unrolling the telegraphic wire as it proceeded, and allowing it to drop to the bed of the sea. In the evening the steamer arrived on the French coast, and the wire was run up the cliff at Cape Grisnez to its terminal station, and messages were sent to and fro between England and France. But the wire, in settling into the sea bottom, crossed a rocky ridge, and snapped in two, and thus the enterprise for that time failed. A stronger cable was prepared, the type of which is used at the present day almost entirely unmodified, and in November, 1851, was laid between Dover and Calais, and successfully operated.

The practicability of submarine telegraphy being thus established, lines rapidly multiplied. In May, 1853, a cable was successfully laid and operated between Dover and Ostend, and in the following year connection was established between Holyhead and Howth, and between Paris and Bastia.

As early as 1845 a plan to unite Europe and America by telegraph was entered at the government registration office in England, and proposals for carrying out the plan were submitted to the government, but were not accepted. In 1857 the plan was attempted to be carried out by a company, with the concurrence of the British and American governments. The cable, 2,500 miles in length, having been constructed, and thoroughly tested, the work of laying it down commenced at Valentia, in Ireland, Aug. 5, 1857. Four vessels were employed; two American, the *Niagara* and *Susquehanna*, and two British, the *Leopard* and *Agamemnon*. After sailing a few miles the cable snapped. This was soon repaired, but on August 11, after 300 miles of the cable had been laid, it snapped again, and the vessels returned to Plymouth. A second attempt to lay the cable, made in June of the following year, was defeated by a violent storm. Later in the year a third attempt was made, which was entirely successful. The junction between the two continents was completed by the laying down of 2,050 miles of cable, from Valentia, Ireland, to Newfoundland. The first two messages were sent Aug. 5, 1858, and were: one from the Queen of England to the President of the United States, and the other his reply. This event caused great rejoicing in both countries; but, unfortunately, the insulation of the wire being faulty, the power of transmitting intelligence ceased a month later.

A new company was formed in 1860, but it was not till 1865 that the work of laying down a new cable was undertaken. The *Great Eastern* steamer, engaged to lay down 2,300 miles of cable, with 25,000 tons' burden, sailed for Valentia, July 15, 1865. After connecting the cable with the land, the *Great Eastern* sailed from Valentia, July 23. Telegraphic communication with the vessel (interrupted by two faults, due to defective insulation, caused by pieces of metal pressed into the gutta

percha coating, which were immediately repaired) finally ceased Aug. 2. The apparatus for raising the wire proving insufficient, the vessel returned to England.

During the winter the Atlantic Telegraph Company was reconstituted as the Anglo-American Telegraph Company, and in June, 1866, the *Great Eastern*, with a new cable on board, again sailed for Valentia. The shore end was spliced with the main cable, and July 13, 1866, the *Great Eastern* sailed for America, reaching Heart's Content, Newfoundland, and completing the laying of the cable July 27, 1866. During the same year the lost cable of 1865 was recovered, and its laying completed at Newfoundland.

Prior to this cables had been laid connecting London with Constantinople, Cromer with Enden, Aden with Suez, Malta with Alexandria, England with Bombay, and Marsala with La Calle.

RECORDING AND ALARM GAUGE.

In 1868 the French government granted a concession for 20 years to Julius Reuter and Baron Emile d'Erlangen, for a French Atlantic telegraph line; and the European end of the cable was laid at Brest, June 17, 1869, and the American end at Duxbury, Mass., July 23, 1869.

In 1870 a cable was laid between Bombay and Suez, and in 1873 the fourth Atlantic cable was laid by the *Great Eastern* from Valentia, Ireland, to Heart's Content, Newfoundland. The Brazil telegraph cable was also opened in September, 1873.

In 1874 a great electric cable ship, the *Faraday*, was constructed, and sailed to lay the "Direct United States Company's cable," May 16. The shore end was laid in Nova Scotia, May 31, in New Hampshire, June 8, and connected with Newfoundland in July. The sixth Anglo-American telegraph was laid by the *Great Eastern* in August and September of the same year.

In December, 1879, the South African cable line between Mozambique and Natal was opened to the

public, and June 1, 1883, a new French Transatlantic cable from Brest to New York was completed. The following year a new Atlantic cable was laid by the *Faraday*, and in September, 1882, a line was completed from England to Panama.

During the last decade lines have multiplied until there are now (1891) 942 submarine cables, exclusive of the seven working Atlantic cables, with an aggregate length of 112,740 nautical miles. For laying and maintaining this huge network of cables, a fleet of nearly 40 vessels is constantly occupied.

THE PHONOPORE.—The phonopore is a telegraphing device invented by Mr. Langdon-Davies, of London. Some two or three years ago, he first developed the system of transmitting signals through circuits which in the ordinary sense are not closed. Recent experiments in his laboratory were made through an artificial line of 4,000 ohms' resistance, and comprised the sending of phonopore messages alone, and of phonopore and telegraph messages simultaneously, in the same wire, and in the same or opposite directions. In one experi-

ment the same wire transmitted a telegraph message and two phonopore messages simultaneously, and the working of the phonopores was perfect, even after the resistance of the line had been increased to 23,000 ohms, when the telegraph messages, which were received by needle instruments, could no more be read. A further experiment was made with a line wire open at both ends, and containing a resistance of 100,000 ohms. In this case the ordinary telegraph could, of course, not be worked at all, but duplex working of the phonopore was perfectly feasible.

At St. Pancras, messages were being sent by phonopore between London and Leicester in both directions, on one of the company's wires which all the time transmitted ordinary telegraph messages. The London phonopore was joined to the line between two Morse relays about half a mile apart, one at the passenger and the other at the goods station, while the Leicester phonopore tapped the line thirty miles from the nearest telegraph instrument, which is at Derby. Between Leicester and London there are on this wire about six telegraph

ELECTRIC LOCOMOTIVE.

ELECTRIC ELEVATOR.

instruments, and as during operation the continuity of the line is constantly being broken by the working, each instrument is shunted by a phonopore, so that the phonopore messages are translated some six times.

This method of bridging the telegraph instruments does not in any way diminish the clearness of signals as compared with a continuous wire. The messages were printed on a Morse receiver, which was actuated by a phonopore relay. The phonopore transmitter has a vibrating reed, and the distant phonopore receiver is also provided with a reed in the shape of a stretched steel band, which can be tuned to the same note.

TELEGRAPHING FROM A TRAIN IN MOTION.—One of the latest inventions in the art of telegraphing is a device by means of which messages may be sent to and from a railroad train when traveling at any speed. The surprising feature of this invention is that there is no connection between the train and the telegraph wire beside the track, over which the messages travel to the station, after jumping from

the car to the wire. The message is telegraphed from inside to the tin roof of the car, and reaches the regular telegraph wire along the track by means of lines of force which each signal throws through the air as soon as it reaches the roof. The signals created in the main line in this way are much fainter than the ordinary telegraph signals, but this difficulty is easily overcome by using more sensitive receiving instruments. The operation of telegraphing to the car is carried on in the same way. The message is sent along the line, and imparts a slight electrical effect to the metallic car roof at each signal. The weak signals thus produced in the car roof are listened to with a delicate receiving instrument in the hands of the operator. As the main-line wire is parallel with the track, it makes no difference where the car is; and as the action of electricity is almost immeasurably quick, it makes no difference how rapidly the car is moving. The only special construction required to adapt a line for use with this system is that the wire be strung on rather short poles, so as

to bring it near the roofs of the cars. The instruments for the operator on the train are portable, and are arranged to be held in the lap like a writing tablet.

EXTENSION OF ELECTRIC TELEGRAPHING.—The overland telegraph has assumed mammoth proportions. There is in the United States alone a total of 807,589 miles of wire, enough of the attenuated metal to go around the equatorial belt of the globe 32 times. France has 241,800 miles of wire; Germany 186,733; Great Britain and Ireland 183,502; and Russia 172,360. In number of messages transmitted the United States leads with 80,000,000, followed by Great Britain with 57,765,347; France 22,341,000; Germany 17,782,323; Austria-Hungary, 13,240,642, and Russia 10,477,049. The following table exhibits the number of miles of lines, of wire, and number of messages transmitted in each country of the globe for the year indicated:

Countries.	Year.	Miles of Lines.	Miles of Wires.	Number of Messages.
Algeria.....	1888	7,000	16,000	
Argentine Republic.....	1889	14,700	28,550	3,511,430

1889 was 31.2; in 1890 was 32.4. The average cost per message to the company in 1868 was 63.4; in 1889 was 22.4; in 1890 was 22.7. The number of messages annually transmitted throughout the world may be estimated at 300,000,000.

PROGRESS IN RAPID TELEGRAPHING.—In 1837 the first telegraph of Cook and Wheatstone transmitted messages at the rate of four words per minute, five wires being required; now six messages are conveyed by one wire on the Delaney multiplex apparatus at ten times that speed; and on the Wheatstone fast-speed apparatus 600 words per minute are transmitted on one wire.

TELEPHONE.—The history of the telephone is quite modern, although as early as 1850 the probability of speech being telegraphically transmitted was foreshadowed; and again in 1860, Reis succeeded in transmitting musical sounds and imperfect speech. It was reserved for Graham Bell, in 1876, completely to solve the problem, and for Edison a little later to perfect the same by the invention of the "carbon transmitter" (see Britannica, Vol. XXIII, pp. 127-135). An important advance has been made in telephony by the discovery that the use of copper, instead of iron wire, enabled the telephone to work to a practically unlimited distance, and long-distance telephone lines are being rapidly extended throughout the country.

According to the latest statistics made public by the American Bell Telephone Company, which practically monopolizes the telephone business in the United States, there were in 1890 in this country 757 exchanges, 471 branch offices, 192,610 miles of land wire, 603 miles of submarine cables, 156,780 circuits, and 185,003 subscribers. The number of instruments in the hands of licensees under rental at the beginning of 1890 was 444,861. The number of exchange connections daily in the United States is 1,240,147, or a total per year of over 400,000,000. The average number of daily calls per subscriber is 6.13. The company received in rental of telephones in 1889 \$2,657,361. It paid its stockholders in dividends during the same year, \$1,838,913. The Bell Company and its subsidiary companies represent about \$80,000,000 of capital; the Long-Distance Telephone Company about \$5,000,000.

ELECTRIC MOTORS.—Electric traction was first practically worked in 1879 by Dr. Werner Siemens, who constructed and started an electric tramway in the grounds of the Industrial Exhibition at Berlin. A train of three cars was placed upon the railway, which was 900 yards long. On the first car an electro-dynamic machine was so fixed as to cause one pair of wheels to rotate when the current passed through its coils. A middle rail, supported on insulating blocks of wood, ran between the working rails, and by this the current was led from the generating apparatus to the car. After passing through the electric motor, it passed by the wheels to the outer rails, and so back to the generating dynamo. Between twenty and thirty persons at a time could be accommodated on the train; and during the summer of that year 100,000 were carried over the line at a speed of from 15 to 20 miles an hour. The locomotive could exert 5-horse power, and was started and stopped by a commutator for closing and opening the circuit. Since then the progress of electric traction has been very rapid, and in the United States alone there were in 1891 over 200 electric railways, having a collective length of 1,750 miles, with 2,400 motor-cars traveling thereon.

In the present state of electrical science, however, electric motors cannot take the place of the steam

The Western Union Telegraph Company reports the average toll per message in 1868 was 104.7; in

engine for originating power. Given a supply of electricity, the motor can be used for all sorts of purposes, and can be applied to almost as many uses as a steam engine. But to obtain the electricity cheaply we must have power of some kind. There must be a waterfall, or a steam engine, a tide-mill or a wind-mill to produce the power in the first place. By this power a dynamo can be driven, and this gives the electricity for driving motors. Electricity is the driving power of the electric motor as steam is of the steam engine. As a consequence the motor's usefulness is limited to such places as are within the reach of an electric supply. By means of wires the electricity can be conveyed to motors over a distance of some miles from the generating station. The use of the electric motor cannot be considered applicable to all purposes until some means have been discovered whereby electricity may be produced from coal as directly as we now produce steam by burning coal beneath a boiler. At present we have first to produce power in order to generate electricity, then transmit it by wires to the motor which transforms the electricity again into power, and so does our work. The economy or the reason for this double transformation is found in the ease with which the transformation is accomplished. Instead of costly and cumbersome

shafting, belting or ropes, only moderate-sized wires are required. Instead of being limited to short distances and to fixed locations, the wires give great freedom for the change of location, and the distance covered may be several miles.

ELECTRIC STREET RAILWAYS.—In an able paper on this subject, read before the Society of Arts in Boston in 1889, Capt. Eugene Griffin, well known as an electrical expert of high authority, presented a mass of statistics showing the great progress already made in the use of electricity on street railways, accompanied by a great amount of information of practical interest and value, portions of which we condense as follows:

The dynamo or generator and the motor are theoretically the same. If a steam engine be belted to an armature pulley and the armature pulley be made to revolve, a current of electricity is passed through the machine, the armature is made to revolve, and by belting to the armature pulley, mechanical power is available. In this way one dynamo will convert the mechanical power of the steam engine into electrical power, and the electrical power may be carried through the wires to the second dynamo, perhaps five miles away, where it is reconverted into mechanical power, and so made available for any desired purpose. The second dynamo is called the motor, and differs from the first, not in principle, but only in details, which make it better suited for its special work. In this way we do away with the zinc fuel and come back to coal, except in those places where we are fortunate enough to have water power.

WESTINGHOUSE IRONCLAD GEARLESS MOTOR.

A brief description of the dynamo or generator and the motor is essential to a proper understanding of this subject.

The modern dynamo electric machine is simply an application on a larger scale of Professor Faraday's discovery that if a wire be moved through the magnetic field of a permanent electro-magnet, a current of electricity is produced in that wire. A dynamo machine consists of a pair of field magnets, between whose poles or extremities revolves a soft iron rotating support, wound about with a series of coils of wire in which the current is developed. The revolving body is called the armature. It is generally made to revolve by belting a steam engine to a pulley on the armature shaft. As each wire moves through the magnetic field of one pole of the magnet, the induced or generated current in the wire is in one direction; as the wire moves through the field of the other magnet pole, the current is in the opposite direction. The current taken from the poles of the machine or generator, as it is usually called, would therefore be alternating, were it not for the device called a commutator.

This consists of a copper cylinder on the armature shaft, divided into as many segments as there are separate coils of wire in the armature, each segment insulated electrically from the others and connected with its own armature coil. This commutator revolves with the armature, and against it are pressed two copper brushes, as they are called, which do not revolve.

These brushes are the current collectors, and when they are connected by a metallic wire five inches or ten miles long, so as to close the circuit, a direct current flows through this wire as long as the armature is made to revolve. Without going into details, it is sufficient to say that the brushes are so placed that as each segment of the commutator comes in contact with the brush, the induced current in the corresponding wire is flowing in a constant direction, so we have a direct instead of an alternating current. As a matter of fact the armature is not made up of separate coils; but the

connections are so made with the commutator segments that we may theoretically regard the coils as separate.

The motor is practically the same as the generator, except that the power applied is electrical energy and the power obtained is mechanical. The current coming from the generator goes to the brushes on the motor, thence to a segment of the commutator and so to the armature coils. The wire with a current flowing through it in a given direction is repelled by one pole and attracted by the other. The powers of attraction and repulsion compel the armature to move; it revolves and we have mechanical energy. We gear the armature to the car axle and we have motion.

There are two general methods of using electricity for the propulsion of street cars:

1. The direct method by conductors extending from the dynamo along the track.
2. The indirect method, by the use of storage batteries secondary batteries, or accumulators.

In the direct method the conductors may be overhead, underground, or on the surface. In the conduit system the conductors are placed in a conduit between the rails or between the tracks. The wires must be bare and yet must be thoroughly insulated from the ground, a condition very difficult to obtain under circumstances. A slot about five-eighths of an inch wide gives access to the conductors by means of a contact plow, but unfortunately also permits the flow of water, slush, mud, etc., into the conduit.

The overhead wire is suspended from poles by brackets or from cross-wires which span the street between poles on either side. When the street is of sufficient width, poles are placed in the center of the street between the two tracks, with bracket arms carrying the conducting wires. These poles are placed about 125 feet apart, and from actual experience are found to present little or no obstruction to traffic. The wires may be single or double. When single wire is

used, the rails are utilized for the return current. When two wires are used, one wire carries the outgoing and one the return current. Contact is obtained with the wire by an over-running or an under-running trolley. The over-running trolley is a light carriage with one or more wheels resting on the wire.

A flexible conductor carries the current down to the car. The trolley is pulled along by the flexible conductor. The objections to the over-running trolley are that it is difficult to keep the trolley on the wire, it is difficult to replace the trolley when it comes off, and any automatic system of switching on to a turnout, branch, or Y is impossible. The latter is such a serious objection that except in special cases the over-running trolley will never be used. In the under-running trolley a light arm of the requisite length is mounted on the top of the car, reaching up to the wire. A wheel on the end of the arm is pressed up against the wire by means of springs at the other end, and the current is car-

ried from the wheel down through the arm itself if made of metal or through wires if the arm is made of wood. This arm is usually called the contact bar. The under-running trolley is automatic in its action at curves, turnouts, etc., and follows the direction of the car. It turns on a swivel through the entire circle, and moves through an arc of 90° in a vertical direction.

In the storage system, a battery of about 120 cells is carried on the car, and the motors are driven by the current from this battery. The advantages of this system are:

1. The cars can run on any track.
2. No wires, either overhead or underground, are required.
3. Each car is more independent than is the case in other systems.

The disadvantages are:

1. The extra weight of about two tons on each car. The power required to carry this dead weight in addition to that required to drive cars required by the other methods.

ELECTRIC CAR ON A 10 PER CENT. GRADE.

JULIEN CAR PROPELLED BY STORAGE BATTERIES.

2. The lack of efficiency in the batteries. The highest efficiency claimed is 82 per cent. The actual practical efficiency is stated by many authorities as about 70 per cent.

3. Storage cars cannot be regularly operated on grades exceeding 5 per cent. or 6 per cent. The power required on grades makes too great a demand on the batteries.

4. The expense. The cost of two sets of batteries per car is about \$3,000.

5. The cost of maintenance. Batteries have not yet been made of sufficient durability to be operated economically.

There are four qualities which the electric motor must be shown to possess before it will be generally adopted for street-car work. These are efficiency, economy, durability, and reliability.

1. As to efficiency: The steam engine is not an efficient machine. If we can utilize 15 per cent. of the units of energy stored in the coal, we are fortunate. In other words, we must expect a loss of 85 per cent. of the heat units in converting the other 15 per cent. into mechanical power.

The dynamo electric machine, on the other hand, possesses a high degree of efficiency. No good generator runs below 92 per cent. efficiency. The loss in the line depends upon the amount of copper used in proportion to the current to be carried. The size of the conductor is generally calculated for a loss of 10 per cent. The efficiency of the motor under favorable circumstances has been shown to be but little below the generator; in actual tests running as high as 91½ per cent.

In practice it would not probably be taken higher than 85 per cent. Starting, then, with 100 horse-power in the steam engine, we lose 8 per cent. in the dynamo in converting the mechanical into electrical energy. The output of the generator is then 92 horse-power. In the line we lose 10 per cent. and deliver 82.8 horse-power to the motor. Here we lose 15 per cent., and on the final reconversion into mechanical energy on the car we have 70.4 horse-power out of the original 100 horse-power. By no other known method could this power be transported to such a distance with so little loss.

2. Economy: This is perhaps a quality which appeals more directly to the railway official than any other. What will it cost? An electric railway connects Omaha with Council Bluffs across the new bridge. I am credibly informed that to run 20 cars per day they consume five tons of slack, for which they pay \$1.14 per ton. This is 28½ cents per day for fuel. These cars are scheduled at 15 miles per hour, and the average daily mileage per car is over 100 miles. Where natural gas or water is available, fuel may be even cheaper. On many different roads from numerous measurements it has been found that where the grades are slight the power required averages from five to eight horse-power per car. The consumption of fuel varies from three to six pounds of coal per horse-power, according to the style of engine and its more or less economical operation. Of course a road operating only one or two cars would show abnormal results in every way, and these averages are only true of roads operating a number of cars—10 or more. The wear and tear on the generating plant does not exceed three per cent. The depreciation on line work does not exceed or even equal 10 per cent. The depreciation on car equipment has been variously estimated at from 10 to 20 per cent.

On some roads, under very favorable conditions, the cost of renewals and repairs to electrical apparatus has been but little below one dollar per day per car in actual operation. On other roads, under very favorable conditions, the cost of maintenance has been less than 25 cents per day per car.

A mean of the reports obtained from 11 roads in actual operation under different conditions shows a daily cost of operation of less than \$2.50 per car, not including drivers and conductors. Experience has shown that it is well within limits to put the saving of electric over horse power at 25 per cent. In some cases a saving of 50 per cent. has been shown. The secretary of the Des Moines Broad Gauge Railway Company, under date of January 8, 1889, writes as follows: "The receipts from four cars electrically are four times more than five cars by horses."

3. Durability: The Washington road has been in operation for over six months. They now have seven motor cars and seven tow cars. The latter are double-deck cars, on which 160 fares have been collected on one trip. These cars are hauled around sharp curves and up a five per cent. grade by two 10-horse-power motors. While the track was new it settled. A car left the track, and while it was being pried back

THE BENTLEY-KNIGHT TRUCK AND CONDUIT.

PLOUGH, CONTACT SHOES, AND CONDUIT.

one of the motors was injured mechanically. With this exception not a single armature or field has been burned, and the gears show but trifling signs of wear. The road has operated without any repair shop, and practically without any repairs up to the present time.

At Lynn, Mass., a single car has been in daily operation since November 9 of last year. It runs 93 miles per day, and the 1.7 miles of track contains 11 curves and numerous grades ranging up to a maximum of 12 per cent. The durability of the electrical apparatus under such unusual conditions has been remarkable.

4. Reliability: On the Lynn road, above referred to, the single car has made its daily trips with but very few departures from the schedule. On one occasion the car axle broke, due to a flaw in the metal. On another occasion the belt slipped from the engine at the power station. Since the middle of February not a scheduled trip has been lost from any cause whatever, nor has the car failed to run on time. No one can look at the daily record of this car under conditions which would prevent horse-car work, and doubt the reliability of electrical apparatus. On the Cambridge line of the West End road the conditions are unusually bad. During the month ending April 19, the schedule called for 5,912

round car trips. Of these the electrical cars failed to make just four trips.

As the railway employees become more familiar with electrical apparatus and learn more of the details of handling the cars, accidents, mishaps, and lost trips will grow fewer and fewer; but the records above referred to suffice to prove the reliability of the electric motor.

Storage battery cars are in operation on one road in the United States—the Fourth Avenue line in New York city. Conduits have been built in several places, in San José, Cal., and in Denver, Col., they were complete failures. In Allegheny City, Pa., the conduit has operated with considerable success. In Boston it has not been a marked success. There are at the present time over 100 roads in operation or under contract where the overhead wire system is to be employed. From this we may infer that the storage battery and conduit are yet in an experimental stage, while the overhead wire is a pronounced and demonstrated success. What the future of storage batteries and conduits may be no one can tell; but we all hope that the difficulties encountered may be overcome, as the storage system is unquestionably the ideal system.

The objections usually urged against the overhead wires are:

1. They are dangerous, as they carry death-dealing currents.
2. They are eyesores.
3. The poles obstruct the street.
4. They are in the way in case of fires.

Now, the railway wire should not be confounded with other electric wires. Arc and incandescent wires, telegraph and telephone wires, have simply to carry the current from the point where it is generated to the point where it is to be used, and so far as this purpose is concerned they may be above ground or under ground. The railway wire, on the other hand, must have current taken from it every differential of an inch from one end to the other. The wire must be bare that the trolley wheel may be in constant contact. To put this wire underground and to keep it properly insulated is a very different problem from burying the other wires. The railway wire cannot be considered in the same category with other electric wires. Now, as to danger. For railway work we use a constant potential generator, and the cars and motors are placed between the two conductors on the multiple-arc system. One conductor, the overhead wire, runs out from one pole of the generator; the other conductor, the rail, runs out from the other pole of the generator. An electrical connection between these two conductors completes the circuit, and the current flows through the connecting material, whatever it may be. If it be the motors on a car, then the cars move; if it be a man, he receives a shock.

THE IMPROVED EDISON LOCOMOTIVE.

Each connecting material, be it car, man, wire or whatever, receives a current of electricity which is absolutely and always determined by Ohm's law that the current is equal to the electro-motive force or pressure divided by the resistance. The electro-motive force is always 500 volts. With several cars in operation, the amperes of current in the overhead system near the generator may run as high as 181, but each car takes its own proportion according to its resistance. The average resistance of a man is 4,000 ohms. If he places himself in the circuit, he will receive a current which is measured in amperes by dividing 500 by 4,000, or, in other words, a 500-volt current can only drive $\frac{1}{8}$ of an ampere through the average human body. It would not make a particle of difference to the man whether the overhead wire he touched was carrying a current of 1 ampere, or 180 amperes, or 180,000 amperes. The effect in his case would be the same; he would receive $\frac{1}{8}$ of an ampere. Were this not true, then the whole multiple arc theory would be false, and electric railways, as at present operated, would be impossibilities. It would then make no difference as to danger whether one or a million cars were in operation on the line.

To make this matter plain to those unfamiliar with electrical terms, we may suppose the overhead wire to be a large pipe or main through which a pump (the generator) is forcing water; the rails, electrically connected, as another large pipe through which the water is to be forced back to the station. Suppose the diameter of these mains is 12 inches. If they are closed at the outer ends, we may fill the overhead main, but after that no water can flow until we connect the two pipes. Now we will put in a one-inch pipe connecting the upper main with the lower main, say 1,000 feet from the pump or generator. A certain amount of water will flow through the connecting pipe, which amount depends upon its size—one inch—and upon the pressure of the water in the upper main. From the generator to the one-inch connecting-pipe the same amount of water flows in the upper main as flows down through the connection, no more and no

less. Beyond the connecting-pipe, no water is flowing in the upper main.

Now we will put in a second connecting pipe 1,000 feet beyond the first. For the first 1,000 feet we have twice as much water flowing as before. Half of it goes down through the first pipe. It is the same with every additional connecting pipe we put in until we reach the capacity of the upper main or the capacity of the generator to force water through it. By increasing the pressure, we know that we could force more water through the one inch connecting pipe; but so long as the pressure remains the same, the quantity flowing through the inch pipe will be the same, whether the upper main be 12 inches, 12 feet, or 1,000 feet in diameter.

The analogy to electric railway work is close. Electricity takes the place of the water and the connecting pipes are electric cars, or it may be some unfortunate man placed where he had not ought to be. He is only an inch pipe, however, and the pressure (500 volts) can only drive so much electricity through him.

The current for railway work has been fixed at 500 volts, as this is well within the safe limits. A shock from 500 volts is unpleasant, but not dangerous. No man, woman or child has ever been killed or even seriously injured by a 500-volt current. The United States Senate has on this question before them last summer. After a thorough investigation the District committee unanimously reported that a 500-volt current is not dangerous. If there were any real question of its being dangerous, we should use 400 volts or 300 volts. The objection to this, however, is that by reducing the voltage we must correspondingly increase the quantity in order to retain the same horse power, and an increase in quantity (amperes) means an increase in the size of the overhead wires, which is objectionable. The danger limit with the electric current is probably about 1,000 to 1,200 volts.

The poles cannot obstruct the street, as they are inside the curb. They are just as much of an obstruction to the sidewalk as lamp posts and awning posts are—no more and no less. If the sidewalks be narrow and permission can be obtained from the property owners, hooks or eyebolts may be placed on the buildings, the cross-wires fastened to these, and the poles done away with entirely.

Every overhead wire is objectionable to the fire commissioners; the railway wire is less objectionable than any other, because there is but one wire, and this wire is in the middle of the street, away from the buildings.

If the single overhead working conductor is insufficient to carry the current necessary to operate the cars, it must be reinforced by feeder wires. These feeder wires may be insulated and may be placed underground. The overhead wire may be divided into sections of three, four, six, or 1,000 feet in length. At the ends of each section a cut-out or switch may be placed on the pole like a fire-alarm box, so that in case of fire the current may be cut out of the section or sections in the vicinity of the fire. The firemen would then have no difficulty in handling the wires, which in any event are easily cut by pliers with insulated handle. As ladders are usually raised parallel to the face of the building, rather than across the street, and as the cross-wires are 125 feet apart, it would be a very rare thing that the railway wires would be found to interfere at all with the operations of the fire department. As Prof. Thomson pertinently remarked to the insurance representative: "It will not be long before you will be taking power from these wires to put out your fires. It will not be long before we have electric motor fire engines."

Charles J. Van Depoele and Leo Daft were the pioneers in the modern electric railway work in this country.

The first roads were built in 1884-85. The new motive power was, however, viewed with suspicion, and progress was slow until the Richmond road was built by the Sprague Company in 1887-88. This road did much to popularize electric motors. The rapidity with which the horse is now going is shown by the growth of the railway business of the Thomson-Houston Electric Company, one of the several companies working in this field. In the spring of 1888 this company purchased the patents of the Van Depoele Electric Company, of Chicago. At that time there were some 14 roads operating under the Van Depoele electric system. The first Thomson-Houston car was started at Crescent Beach, Me., July 4, 1888. On the 1st of April, 1889, in less than nine months, there were 18 roads with 104 motor cars in operation, and 33 roads with 210 motor cars under contract. The Americans are essentially a fast people. We live fast, and, unfortunately, we die fast. But as long as we do live, we go. Any time-saving device is gladly welcomed, and at once becomes popular. The limit of speed with horse cars is about eight miles per hour. With electricity the only limit is the one we may fix as a safe speed. If horse cars are delayed, there is little or no chance of making up lost time. The reverse is true of electricity. With electricity we have rapid transit, and we can obtain it in a very simple and not too expensive way. Electric motor cars do not smoke or give off noxious gases or make disagreeable noises. It is not necessary to run them in the air or over the ground, though they would run well in either position. They are safe, clean, fast, and reliable. They do not keep the street in an unclean and unhealthy condition. They do not take up as much of the street as do horse cars, for they have no horses. They are brilliantly lighted at night.

All of these qualities appeal to the public, and the verdict everywhere is favorable to electricity. The United States

Senate and House of Representatives in reporting on a proposed extension of the Washington road, said: "It is undoubtedly the best electric railway in the United States, and beyond comparison superior to any horse railway."

To obtain these advantages the public must aid the railways. The rails must be of sufficient weight and of such form as to best carry the increased weight and stand the increased speed. Some form of girder rail weighing not less than 45 pounds to the yard is best suited to this work. The rail must be so placed as to be easily kept clean, and for this purpose should be slightly elevated above the surface of the street.

On the part of the railway companies, while the first cost is great, they can look forward to reduced operating expenses, a greater car mileage per day, and a great increase of traffic. Electricity has undoubtedly come to stay.

TELPHERAGE—Is a special application of electric energy to traction for the conveyance of minerals and goods over a rough district, where the cost of railways is too great for practical use. A telpher line crosses rivers, roads, bridges, and valleys; and even when the whole of the line is erected over a territory continually rising, the telpher locomotive can easily be made to draw loads up gradients which cannot be done on an ordinary railway. Ingenious means have been invented and practically applied to cause a telpher train to travel automatically, without any driver to control it. When properly equipped a telpher train proceeds along the level and ascends or descends gradients at about the same speed. It is the great point in telpherage that the loads should be small, and that the trains should follow each other rapidly. Among the more recent telpher lines which have been made for the carriage of minerals is one at the Eastpool tin mine in Cornwall, England, over a mile and a quarter in length, for the transport of 1,000 tons of tin ore per week.

ELECTRICAL TRANSMISSION OF POWER.—One of the most important applications of electricity to industrial purposes which the modern development of the electric light has led to is the electrical transmission of power. Siemens a few years ago pointed out that no further loss of power was involved in the transformation of electrical into mechanical energy than is due to friction and to the heating of the conducting wires by the resistance they oppose. This loss, careful researches have demonstrated, need not be more than 13 per cent., provided there is no loss in the connecting leads. The Paris Electrical Exposition of 1881 afforded interesting illustrations of the performance of a variety of work by power electrically transmitted, including a short line of railway constructed by the firm of Siemens, which was a further development of the successful result already attained in Berlin by Werner Siemens in the same direction, and was in turn surpassed by the considerably longer line worked by Messrs. Siemens at the Vienna Exhibition two years later.

ELECTRIC PERCUSSION DRILL.

A further development of the electrical transmission of energy is to take place in the utilization of the power of Niagara, and a large tract of land about a mile distant from the falls has been acquired for the purpose, with the view of erecting mills for utilizing the power, which it is proposed to transmit to distant towns. An International

Commission has been formed, which will carefully consider the problems involved in the execution of this grand scheme.

STORAGE BATTERIES, OR ACCUMULATORS.—The problem how to save and store up the enormous amount of natural energy which is daily dissipated in producing natural phenomena has long occupied the attention of scientists. During the last few years this attention has been especially directed toward electricity as an agent, and the result of experiments has been the development of the electrical storage batteries, or accumulators, as they are sometimes called.

ELECTRICAL ACCUMULATOR.

In an interesting article on this subject, published in the "Popular Science Monthly" for January, 1891, Prof. Samuel Sheldon states that the employment of these names for the apparatus is very unfortunate. They are the cause of the popular idea that electricity, which is considered as a subtle, indefinite, and intangible something, is stored up in them, as valuables are stored in a vault. The commercial current electricity cannot, in large quantities, be stored and still preserve its character. It has but a fitting existence, and is no sooner produced than it dissipates itself, and is converted into some other form of energy. The energy which a current may at any instant be said to possess is immediately transformed into heat in the circuit, which will under certain conditions produce light; into chemical energy; into motion, which may or may not produce sound; or into magnetic and electrotonic conditions. The last may either be permanent or have the same evanescent existence as the original current.

When electricity is employed to charge a storage battery, only that part which is transformed into chemical energy is used. The rest is dissipated. The battery, then, instead of being a place where electricity is laid away, is a place where chemicals are left by the current, with the expectation that they will in turn produce a current when called upon. This may seem a fine distinction, but it is only apparently so. For instance, the current might be produced by a dynamo turned by Niagara water-power. The chemical left by it might be zinc deposited from a solution of zinc sulphate. This might be transported, preserved, bought and sold, and finally be employed by some physicist to produce another current. To understand this transformation more clearly, and to obtain a clear idea of what goes on in a storage battery, one must first become acquainted with that part of electricity which treats of the phenomena resulting when a current of electricity passes through a liquid. This is called electrolysis, and the liquid through which a current can be made to pass is called an electrolyte. If a current of electricity flows into a liquid solution of any metallic salt by means of a wire, and if, after traversing it, it flows out through another wire, then it will, by its passage, separate the salt into two parts and deposit the metal upon the latter wire. If, for instance, the solution be one of silver cyanide, then silver will be deposited on the second wire. If a brass fork be connected with this wire and dipped in the solution, it will receive a coating of silver by the process and will be silver-plated. Substitute a solution

of nickel nitrate, and the article would become nickel-plated. By using copper sulphate, the faces of types and cuts are coated with copper, which increases their hardness, and consequently their endurance.

The simplest storage battery, then, would seem to be one constructed of two copper plates suspended in a solution of some zinc salt. A current of electricity passed into this would deposit zinc upon one of the plates. After disconnecting the charging current, the battery of itself would give off a current until the zinc was redissolved.

It might be well, right here, to define a primary battery. If any two different metals be dipped in an

acidulated liquid, and if their external extremities be connected by wire a current of electricity will flow through the wire. Such a combination is called a primary battery. Under the same conditions the amount of electricity obtained depends upon the character of the metals. If nickel and iron were employed, a small amount of electricity would result. If, however, zinc be used in connection with either silver, gold, platinum, carbon, or copper, a large amount is obtained. The

first three of the group are very expensive; hence, in most primary batteries, we find zinc combined with either carbon or copper, the differences between the various forms arising from difference in the liquids employed, or in the shape of construction. Furthermore, pieces of the same metal under different physical conditions, when combined with each other, will give a current. For instance, a piece of polished iron opposed to a rusty piece gives a current; and a plate of very rusty lead, if we may use the expression, combined with a piece of bright lead, yields even more current than zinc or carbon. Unfortunately, lead does not rust sufficiently well to suit electricians, and other physical reasons prevent its being used in primary batteries. It will thus be seen that a storage battery, when once charged, becomes nothing more or less than a primary battery. In the case before described, after charging, we have zinc and copper in a solution of zinc sulphate.

In describing the effects of electricity in passing through an electrolyte, we have assumed that the liquid contained a metal in solution. Suppose, now, that we take water, which has no metal in it, and subject it to the action of the current. The electricity can get no metal to deposit on the wire, where it passes out, and in consequence does the next best thing, and leaves one of the components of the water—namely, hydrogen gas. The other component, oxygen, collects around the entrance wire. The English physicist, Grove, showed that if these two wires, around which the gases had collected, were connected together, a current of electricity would flow the same as if there were two metals instead of two gases. Now, water is cheap, and if there were not some serious difficulties as regards efficiency, Grove's battery would be universally employed. It was reserved, however, for M. Gaston Planté to construct the first practical secondary battery. He considered the following points in its construction: Water is cheap; water, when subjected to the electric current, gives off oxygen and hydrogen; rusty lead, when combined

with bright lead, has a high electro-motive force; oxygen makes lead rusty, and hydrogen makes it bright. His battery consisted, then, of two lead plates suspended in water, which contained a little sulphuric acid to assist in the conduction. When a current of electricity was passed through, hydrogen was thrown off at one plate, making it bright, and oxygen at the other plate, peroxidizing its surface. When the charging source was removed, the altered plates would send off a current which was in a direction opposite to the one which had charged them, and this would keep until the plates had assumed their original condition. Planté's choice of materials was most wise, and all practical storage batteries of to-day are but modifications of this style. In order that his battery might give a strong current, and one that would last a long time, it was found necessary that his two lead plates should be as near to each other, and that they should be as large as possible. He accomplished both of these ends with economy of space by winding large plates into a spiral form, they being separated from each other by strips of rubber.

In charging this battery, care must be exercised that the current be not too strong; otherwise the gases would be sent off too rapidly for the lead to take them up, and they would then rise to the top of the liquid and escape into the air. The electrical energy which separated them would thus be lost. It accordingly takes a long time to charge a new Planté battery to its full capacity. After being subjected to the current for a day or two, it will be found that the plate which received the oxygen has changed its physical character; instead of having a smooth surface, it presents a spongy appearance, having little holes and cavities in it, and thus exposes a larger superficial area. If the battery be now discharged, and be again subjected to the charging current, it will be found that a much stronger current may be used than at first, without any gas escaping. This is owing to the much larger surface exposed and to its spongy character. This original charging of a new battery, to change the character of the lead surfaces, has been termed *formation*, and, inasmuch as only one plate is altered by a charge in one direction, a complete formation consists in a charging in two directions.

From what has been said it will be seen that the electricity which is used for charging an accumulator is apparently used in the production of oxygen and hydrogen gases. These are made to oxidize one plate and clean up the other. Now, an interesting question arises, whether it would not be more economical to employ gases, which can be more cheaply produced through chemical means. Difficulties, however, arise here; for the oxygen of electrolysis is generated in the form of nascent oxygen, which is far more active than ordinary oxygen. A molecule of the ordinary gas contains two elementary atoms, which work upon each other; with the electrolytic generation, however, a single atom is sent off, and this is chemically very active. It is sometimes called ozone; but chemists say that a molecule of ozone contains three atoms. Now, there is no known method of chemically manufacturing ozone in large quantities, and ordinary oxygen does not produce the desired effect. Again, Planté's supposition that the charging current produced these two gases only, is incorrect. The sulphuric acid in the water, which he supposed only assisted in the conduction, really acts upon the lead in forming lead sulphate. This has its use in preventing the charged battery from running down when not in use, and from too rapidly expending itself when put to use.

PRIMARY BATTERY.

The storage battery is susceptible of many improvements, chiefly in respect of increasing its durability. A more perfect system is much to be desired. The advance made in the past few years in this direction has been encouraging, and to prophecy that a practicable system will be produced before the world is many years older (in fact, in dealing with electricity, whose development is so rapid, we might say months instead of years), is to make a very safe prophecy indeed, as the entire history of electrical and mechanical invention points to such a conclusion.

POLICE AND FIRE ALARM SYSTEMS.—In the police and fire alarm signaling system in use in Boston, Mass., and several other cities, numbered signal boxes, containing telephones and automatic signaling instruments, are placed on every patrolman's beat, and are electrically connected with the

police station. From them the patrolman can either telephone or automatically transmit messages to the station, or the station house can signal the patrolman. Citizens can also summon police assistance from any signal box. The signaling system consists of three distinct and non-interfering methods of communications: namely, automatic and manual signaling from the street stations to the station house, automatic and manual signaling from the station house to the street stations, and telephonic communication between the street stations and the station house and *vice versa*. These are arranged to operate over a single metallic circuit. The signaling from the street stations to the station house is further divided into two classes: alarm signals, comprising signals directing the station house to send a patrol wagon or ambulance, or to use the telephone; and "patrol" or "on duty"

Fig. 1.—POLICE AND SIGNAL SYSTEM.—STATION HOUSE DESK, SHOWING REGISTER, TIME-STAMP, ETC.

signals, which indicate at the station house the movement of the patrolmen over the territory under their charge. The signaling from the station house to the street station is accomplished by the use of currents of electricity of a different character from those employed to signal from the street station to the station house, and they sound a bell in the street station to indicate the reception by the station house of an alarm signal, or to announce to the patrolman that the station house desires to speak to him by telephone. The telephones are inductively connected with the circuit, and they are so arranged, with relation to the signaling part of the system, that conversation may be carried on between two or more points, signals may be sent from a street station to the station house, and

from the latter to the former, all simultaneously over a single wire without interference or confusion.

Figure 1 illustrates the station house desk, showing register, electric time-stamp, etc. Figure 2 shows a signal box in position to be operated with a citizen's key. Figure 4 shows a signal box with the door open, while Figure 3 shows the stable apparatus for patrol-wagon service. When the door of the signal box is open (Fig. 4), a large dial and pointer, the automatic signal pull cooperating therewith, a telephonic receiver and transmitter, are exposed to view. Upon the dial are inscribed the alarm signals as desired. Upon the inside of the dial is mounted the signaling mechanism, including a gong to receive and sound the signal sent from the station house. By turning the pointer to

the service required and operating it by the pull, any one of the inscribed signals may be automatically transmitted. A push button is also provided to communicate with the station when a connecting wire is broken. A call for the patrol-wagon may be sent from the outside with the door closed, by simply inserting a key, termed the "citizen's key," into a key-hole at the front of the box and turning it as far as it will go. This key cannot be withdrawn until the door is opened. A master-key is carried by each patrolman. The boxes are made of iron, very strong and substantial. The pointer may be turned to the right or left, and the act of closing the door always sets it back to the zero or starting-point. The receiving cabinet to be used at the station house (Fig. 1) is carefully constructed and wired, and serves as a very convenient operating table. The signals received from

Fig. 2.—SIGNAL BOX.—IN POSITION TO BE OPERATED WITH "CITIZEN'S" KEY.

the street stations are recorded in ink automatically upon a paper tape, which also receives the impression of an automatic time and date stamp, so as to mark upon the tape the exact time at which each signal is received.

CAPITAL PUNISHMENT BY ELECTRICITY.—Of all the potent forces capable of producing death, there is none known to science more nearly instantaneous than electricity. In the ordinary occurrence in nature, where a person struck by lightning falls dead, nothing can be more sudden or rapid. And where electricity is generated artificially for illuminating purposes, the interruption of the alternating current by the intervention of or contact with any portion of the human body is invariably followed by the most serious consequences to the latter. Numerous cases of accidental death by such contacts have been recorded during the

past few years, and in every case the action of the current was so instantaneous as to leave not the shadow of a doubt that death was literally quicker than thought. The body was not mutilated; there were no indications of any death-struggle; none of physical pain. Respiration and heart-action instantly ceased, and electricity, with a velocity equaling that of light, destroyed life before nerve-sensation, at a speed of only one hundred and eighty feet per second, could reach the brain.

Fig. 4.—STABLE APPARATUS, FOR PATROL WAGON SERVICE.

Recognizing the advantages of electricity as a death-dealing agent, the legislature of the State of New York in 1888 amended its Code of Criminal Procedure by substituting for the death penalty by hanging the "causing to pass through the body of the convict a current of electricity of sufficient intensity to cause death; and the application of such current must be continued until such convict is dead." The first "electrocution" under this provision of the law took place in the State-prison at Auburn, N. Y., Aug. 6, 1890. After a few preliminaries the victim, William Kemmler, was

seated in a large oak chair, and securely confined with straps. An electrode, formed of a rubber cup containing a sponge wet with sodium chloride, was pressed down upon a spot upon the murderer's head, from which the hair had been closely cropped. The other electrode was similar in construction, but was attached to a stiff spring, which projected upward from the seat of the chair. This was placed in contact with the bared skin at the base of the spine. The warden gave a pre-arranged signal to an assistant stationed at the switchboard in an adjoining room, who turned the switch and closed the circuit. There was a sudden momentary convulsion of the victim, and apparently all was over. Death appeared to be instantaneous and painless. In 17 seconds the current was turned off,

and the body at once collapsed. A moment later, however, Kemmler gave signs of life, and the current was turned on a second time, the circuit remaining closed for a period of about four minutes, and until smoke was noticed curling upward from the two points of contact, and the pungent and sickening odor of burning hair and flesh pervaded the room. When the current was finally shut off, and the straps removed, the body collapsed and sunk in a heap on the chair.

The facts regarding this first execution were so surrounded with secrecy, prejudice and interest, that it is difficult to arrive at a true understanding of the actual condition of affairs. The physicians in attendance disagree as to whether Kemmler was killed by the first or second shock. They agree

Fig. 4.—SIGNAL BOX.—DOOR OPEN READY FOR OPERATION.

only that he was unconscious from the instant the fatal current first touched him, and hence that his death was painless, if not instantaneous.

TEMPERING STEEL WITH ELECTRICITY.—An interesting application of electricity to the arts consists of tempering watch-springs by means of the electric current. A one-light dynamo is connected with an ordinary oil-tempering bath. One of the conductors connects with a point within the oil-bath, and the other with a point without. The piece of flat, soft steel wire that is to be tempered to the blue color is fed under the contact-point on the outside of the bath first, and then under the one on the inside. When it reaches the latter the circuit is complete, and the steel ribbon immediately and uniformly becomes heated. No means have been devised to measure the current exactly for the purpose of doing the work mechanically. The variation in the percentage of carbon in different pieces of steel forbids the delicate process of

tempering from becoming a purely mechanical piece of work. Therefore, with the electric current as with a fire, the color of the steel determines the length of time that it shall be heated. This process of tempering has several advantages. The chief one is, that the steel does not have time to oxidize, after it has been heated to the proper color, before it is under cover of the oil, and consequently that the steel ribbon is of the same thickness as it was before it entered the process. The heating is uniform throughout the length of the spring, and there is less liability of defective spots. The process is a rapid one, the springs being heated and passing into the bath at the rate of four inches per second.

REDUCTION OF ORES.—One of the most important of the recent industrial applications of electricity is the reduction of refractory metallic ores by a method based upon the resistance of a mass of carbon to the electric current. The furnace is built

of fire-bricks, and is rectangular in shape. Two carbon electrodes similar to those used in arc lights, are passed through opposite walls of the furnace. The ore of the metal intended for reduction is mixed with coarsely pulverized gas carbon, and formed into a sort of long core, the ends of which are connected with the electrodes referred to above. The furnace is filled with finely powdered charcoal, forming a bed in which the core of gas carbon and metallic ore rests. The charcoal possessing greater resistance to the electric current than the gas carbon, nearly all the current passes through the core; and the walls of the furnace, which would otherwise be destroyed by the intense heat, are protected from injury. When the poles of a powerful dynamo-machine are connected with the electrodes, and the current sent through the central core, owing to its great resistance, an intense heat is developed, far surpassing that of the most powerful blast-furnaces. The most refractory oxides are unable to withstand the temperatures attained in this furnace. Aluminium, boron, silicon, manganese, sodium, and potassium, are all quickly reduced to the metallic state, and the charcoal itself is changed to graphite in considerable quantities. Valuable results are expected from this process, not only in the cheapening of the cost of

certain metals and alloys, but also in an increased knowledge of the behavior of different elements at

THE DEATH PENALTY BY ELECTRICITY.

temperatures hitherto unattainable, and the consequent aid to investigations in theoretical chemistry.

WELDING A BAR BY ELECTRICITY.

WELDING METALS BY ELECTRICITY.—Another important application of electric heating is the electric welding process. The parts to be welded are clamped in vises and pressed against each other at the point where it is intended to unite them. A current of great heating power is then passed through the joint by suitable cables fastened to the vises, and the joint is brought to a melting heat and cooled off again before the heat has had time to spread any distance through either piece. The scaling or defacing of the work by the action of the coals when buried in a blacksmith's fire is thus avoided, and the risks of a bad joint from the presence of ashes or dirt are entirely disposed of. For the same reason very little flux is required. The nature of the joint produced is a little different from an ordinary weld. Instead of being hammered into a union at a red heat, the parts are actually melted together and frozen in an instant.

RANGE-FINDING AT SEA BY ELECTRICITY.—The latest advance in the art of finding distances at sea has been made in the United States, and re-

sults have been obtained which show that the problem of making accurate and quick range measurements by automatic means has finally been solved. People discovered long ago that marine wars could not be ended by paving the bottom of the ocean with cannon balls, and sea captains were instructed not to engage an enemy until he came within point-blank range, which is the distance over which the shot will fly before striking the water when the gun is fired at level from its port on board ship. This distance was then about 500 yards. The greater accuracy of modern weapons has increased this fighting distance, but still no naval conflict has been fought with a greater distance between the contending vessels than that of 1,100 yards. At any greater distance the firing was very inaccurate, not only because it is harder to hit a target at 1,500 yards than at 1,000 yards, but principally because it was difficult to ascertain the exact distance, and hence to determine the exact elevation required for the gun. To insure effectiveness, therefore, beyond point-blank range the exact dis-

tance must be ascertained, and as the target (an enemy's ship) is usually in rapid motion, this measurement must be made instantaneously and automatically, and without calculation. This is now accomplished by the invention of Lieutenant Bradley A. Fiske, of the U. S. Navy. The apparatus is by no means complicated, and involves nothing but simple elementary principles in mathematics and electricity. It is based on the familiar mathematical proposition that if two angles and one side of a triangle are known, the other two sides of the triangle can easily be found. The Fiske range-finder, however, eliminates all calculations, and finds the range automatically. A base-line fixed once for all on the ship is the known side of the imaginary triangle. The distance of the object is represented by either of the other two sides. The target, therefore, is at one angle of the imaginary triangle; and at the other angles, at the extremities of the fixed base-line, are placed two spy-glasses, which can be directed upon it. As these spy-glasses are turned into the proper position they move over and touch wires which are bent in the form of arcs. The difference in length of the wires passed over corresponds mathematically to the distance of the object. As this length of wire increases or diminishes, it will offer more or less resistance to an electrical current sent through it. A very simple electrical contrivance, amounting practically to a balance, allows this resistance to be measured and read, not in units of resistance, but in yards. The two spy-glasses being pointed at the target, the observer at each spy-glass has nothing to do but to keep it thus pointed. Elsewhere in the ship another observer may stand at a telephone listening to a buzzing sound produced by an electrical device known as a circuit breaker, and simultaneously moving with one hand a pointer over a graduated scale. The instant the buzzing in the telephone stops he reads the range denoted by the pointer from the scale, and conveys the information by a simple form of telegraph to the men at the guns.

While Lieutenant Fiske's invention finds its most immediate use for military purposes, it is not without peaceful adaptations. Many a ship has gone ashore, even in sight of land, through an error of judgment on the part of her navigator as to her distance from the coast. The range-finder will not only prevent such misjudgment, but even at night, when the friendly beacon seems to stand out like an isolated star in the midst of the black chaos of sky and water, the mariner may learn with certainty his distance from the perilous shoal or reef.

AN ELECTRIC PINNACE.—A wooden pinnace called the "Electric," built for the Royal Engineers, to be propelled by electricity, has recently been launched in England. She is 38 feet 6 inches long over all, by 8 feet 9 inches beam. Her mean draught is 2 feet 3 inches, with all machinery in position and 40 persons on board. The hull is built of mahogany and is unpainted. The motive power is electrical, there being 70 accumulators, having 19 plates each. They have a discharging current of 1 to 40 amperes and 120 ampere hours. The power is transmitted from the accumulators to a motor discharging 32 amperes at full power, the propeller rotating at 800 revolutions. The propeller is 22 inches in diameter, and is of delta metal. The maximum break-horse power is $5\frac{1}{4}$, which is said to give a mean speed through the water of $8\frac{1}{4}$ miles per hour. The motor is a single magnet machine, designed especially for marine propulsion. The boat will run from 8 to 12 hours with one charge of the accumulators. The total weight of all machinery is $2\frac{1}{2}$ tons, the displacement being $4\frac{1}{2}$ tons. There

are two masts, each carrying a balance lug-sail, there being also a stay-sail forward. The sail spread is about 350 square feet. With the effective lead ballast, given by the accumulators, the boat should perform well under canvass, especially in view of the small propeller that is characteristic of electrical vessels.

ELECTRIC ALARM THERMOMETER.—A recent invention is the application of an electric alarm to a thermometer, causing the thermometer to sound an alarm whenever the temperature rises above or falls below any required point. It is designed for use in offices, schools, hospitals, breweries, and all places where the maintenance of an equable temperature is desired. Its construction will be readily understood by reference to the accompanying illustration. The electrical alarm can be arranged to sound at any distance from the thermometer, and the device can thus be used to sound an alarm in case of fire.

ALTERNATING CURRENT FAN MOTOR.—Another interesting device

is a fan motor for use with alternating currents. The motor is simple in design and light in weight, and will drive a 12-inch fan at 1,000 revolutions per minute with a current of about one ampere. The whole apparatus, motor and pedestal, as illustrated, weighs only about 15 pounds, thus rendering it very portable.

The motor comprises an arc-shaped laminated field magnet and a continuously wound drum armature, having a finely laminated core and a commutator, the field magnet and armature windings being connected in series relation. The motor is used on a 50-volt transformer circuit, and exhibits almost no sparking. The simplicity of the device is one of its chief recommendations, presenting many analogous points of construction to a direct current motor, except its fine lamination, which adapts it for alternating currents. There is very little heating of the iron when the motor is in operation. It is adapted to a number of commercial and domestic uses, in which but little power is required, such as the operating of fans, and the driving of sewing-machines.

AN ELECTRIC AWAKENER.—One of the latest electrical novelties consists of an ordinary alarm clock with an electrical attachment, which includes in circuit one of the rollers at the bottom of the legs of the bed. When the hour arrives at which the sleeper has set the alarm, his weight closes the circuit and the bell rings, and continues to ring until the sleeper gets off the bed. A spring is adjustable to the weight of the person.

ELECTRICITY IN MACHINE BELTING.—In a dry atmosphere and between shafting practically insulated by wooden blocks, or other non-conducting means of support for the bearings, a troublesome development of electricity sometimes takes place with machine belts driven at a high velocity. The pulleys become veritable frictional electric machines, excited by the rubbing of the belting. Herr Bacher, inspector of lighting at the Dresden Theater, declares that very powerful effects may be produced by this means. A Leyden jar has been charged in a few seconds, giving sparks 4 millimeters long when discharged. It is probable that to

ELECTRIC ALARM THERMOMETER.

this cause may be attributed many disastrous fires, which are generally classified as spontaneous. Flourmills, factories in which the air is heavily charged with floating organic fibers of all kinds, are peculiarly subject to these mysterious conflagrations. All lines of shafting, therefore, should be metallically connected, through their bearings, with other masses of metal or the earth.

ELECTRO-THERAPEUTICS.—The medical and surgical relationships of electricity are so extensive that it is impracticable to give more than the briefest mention in a work of this character. In the "International Medical Annual" for 1890, A. D. Rockwell, M. D., of New York, an acknowledged authority on this subject, asserts that electricity is a tonic of a very high order. It possesses varied influences of this kind, according to the method of its application, and therefore may be indicated in

a multitude of symptoms, and for conditions apparently most diverse in their origin and character. Electricity may be said to be indicated whenever a constitutional tonic influence is called for. For the long period of convalescence following typhoid or typho-malarial fever, there is no remedy that is comparable with it; and in almost any condition where a constitutional tonic influence is indicated, electricity, in some one of its methods of applications, is likely to be of more or less service. It gives passive exercise to the muscles; it promotes and renders more natural the processes of excretion and secretion; it corrects circulatory disturbances—in a word, it imparts tone and strength to both nerve and muscle.

While the consensus of opinion among those who have had any adequate experience in the use of electricity is that it is occupying a position of

ALTERNATING CURRENT FAN MOTOR.

growing importance, there are yet differences of opinion in regard to its efficacy. Dr. M. Allen Starr, in a paper on the "Physics and Physical Action of Electricity," read at a meeting of the New York Academy of Medicine, March 21, 1889, stated: (1.) "Static electricity offered nothing more than the interrupted galvanic current, and failed to furnish those effects which were most desirable in the treatment of disease. (2.) The constant galvanic current could produce chemical changes which aided nutrition or destroyed tissue according to the strength employed. (3.) The constant galvanic current could transfer medicines into the body from without. (4.) The interrupted galvanic current or Faradic current could excite various organs to functional activity. (5.) It was questionable whether the pathological state causing organic diseases could be in any way influenced by electricity. (6.) If functional diseases were benefited, it was in an uncertain manner, and the physiological indications for the agent were as yet uncertain.

Dr. L. C. Gray, in a paper on the effects of "Electricity on Central Nervous Diseases," claimed it to be an efficient remedy in relieving sub-acute mania, melancholia, the insanity of doubt, and functional insanities, but only in the period of convalescence, not in the acute stage. Of the gross cerebral diseases it might be said that it was useless to administer electricity in brain tumors, meningitis of traumatic, epidemic, or aural origin, or in facial hemiatrophy. It was a useful adjuvant in intracranial syphilis, in the early stages of headache and insomnia, and sometimes in the later stages following hemiplegia.

Dr. W. R. Birdsall, in a paper on the "Effects of Electricity on Spinal-cord Diseases," while admitting that he had never seen a case of organic disease of the spinal cord cured by electricity, stated that he had never seen such a case cured by any single therapeutic agent whatever. But for the relief of symptoms he had seen electricity serve a more useful purpose than any other. Electricity was essentially a stimulant, an exciter of living

tissues. He believed, however, that the main benefit obtained from electricity in spinal-cord diseases was due to the peripheral impression.

Dr. E. D. Fisher, in a paper on the "Effects of Electricity in Functional Nerve Affections," considered galvanism more important as a remedial agent in functional nervous diseases than was static or Faradic electricity; yet, in neurasthenic cases, static electricity had a stimulating and pleasing effect. It was in functional diseases, however, with error in nutrition, and not organic troubles, that static electricity found its field of usefulness.

Dr. A. D. Rockwell, in a paper on "Electricity in Peripheral Nerve Lesions," declared that electricity sensibly hastened recovery in curable cases. While admitting that electricity possesses only a limited range of usefulness in severe lesions of either the central or peripheral nervous system, he thought it was one of the most efficient remedies we possess for the relief of the various symptoms associated with these lesions, while, for the removal of the finer nutritive disturbances that underlie many persistent neuralgias, the galvanic current was certainly a remedy of the greatest value.

CURATIVE EFFECTS OF ELECTRICITY.—An interesting illustration of the curative effects of electricity is reported from Bangor, Me. A lady who, as it was supposed, had become a crippled paralytic for life, and had been advised by her physicians that she could not live more than three months, while waiting for death to set her free from her sufferings, was taken out for a ride on an electric street car. Although very exhaustive, the ride appeared to do her good, and each pleasant day thereafter the trip was repeated, the invalid clearly improving day by day. In about a week her appetite showed a marked improvement, and her paralyzed limbs became more sensitive. In about two weeks a strange pricking sensation was felt in the hand and foot that were paralyzed, as if they were asleep. As both limbs had been without sensation for 12 years, this was deemed remarkable, and the rides were continued with increased frequency. In five weeks she exchanged her crutch for a cane, and in another week discarded the cane. All this time she had been taking no medicine, yet her strength steadily increased; and a few weeks later she was apparently entirely cured. One of Bangor's leading physicians, who had been in attendance upon the lady, stated that her recovery was entirely due to the currents of electricity passing through the car. She was naturally sensitive, and what to most persons would have been too weak a current to have been felt, acted as a tonic to her, and coming when it did led to her recovery.

ELECTRICITY AND HYGIENE.—Not only is electricity a useful slave to the industrial world, doing the mechanical work and annihilating time and space—it also is an ally and helper of sanitary science, and is rapidly becoming one of the most beneficent of sanitary agents known. The use of electric lights in churches, public halls, theaters, and other places of public assembly has been of immense advantage to the purity of the air, hitherto vitiated by the combustion of gas, oil, and kindred agents that depend on atmospheric oxygen for their illuminating power.

Within a very few years it has been discovered that a discharge of electric sparks through an atmosphere laden with dust, has the effect of causing the dust to settle; and this discovery has been utilized in lead furnaces to free the air of the deleterious fumes of volatilized lead. In flour mills, also, electricity is used to free the air from the im-

palpable dust which otherwise permeates the atmosphere, and which is injurious to the health of the workmen, as well as greatly increasing the risk of fire, owing to its extreme inflammability.

In the manufacture of alcohol from beet-sugar refuse as formerly carried on, the alcohol was liable to be contaminated with the higher alcohols which rendered it both unpalatable and dangerous to health. An electrical apparatus has been devised by means of which a certain number of molecules of hydrogen are added to these noxious alcohols, so that the distilled product is completely freed from their presence. Beverages prepared from the alcohol thus obtained are thus preserved from at least one deleterious admixture, and public health is so far the gainer.

Many lives in mines have been saved by the use of electricity, not only as an illuminant, but also as a substitute for the fuse formerly employed in blasting. Scores of miners met their death because the fuse burned too quickly, not giving them time to reach a place of safety before the explosion; or, if it burned too slowly, they often supposed it had become extinguished, and on approaching to place another fuse in its place, were surprised by the delayed discharge. Electricity induces the explosion at the precise moment desired, and if it fails the locality can be approached with perfect safety, as no discharge is possible until the electrical connection has been repaired.

In electrotyping, the battery process has been substituted in place of the old gilding and silvering by the aid of mercury, which was highly injurious to the health of the workmen.

Although it has been frequently asserted that the electric light affects the eyesight injuriously, no doubt much of the evil would be avoided if greater care were exercised in locating the lights. The fact that an incandescent lamp does not give out much heat and will not singe the hair or whiskers, is no reason why the lamp should be placed close to, or on a level with the eyes, where the light can shine directly in them. Incandescent lamps should be properly placed and shaded so as not to cast their rays directly on the eyes, and if these very simple precautions are carried out, there will be no complaint of the injurious effect of the electric light upon the eyesight.

ELECTRICAL INJURIES.—The rapid introduction of electricity as a method of lighting, heating, motor power and locomotion, to say nothing of its use in the telegraph and telephone, has developed a new class of diseases and injuries, which must be taken into account in a general treatment of the subject of electricity. The means by which the electrical current does harm varies, naturally, with the form in which it is used. The telegraph and telephone produce peculiar neuroses, due to the peculiar demand made upon the nervous system of the operator, and not to the electrical current directly, and results in telegraphers' cramp, aural and mental disorders, etc. Most of the observed cases of electrical injury come from the apparatus carrying electrical currents for lighting and power. Such in-

DESK LAMP.

juries were formerly produced only by lightning, and were consequently rare.

Electrical currents produce three kinds of severe accidents: (1) They kill at once; (2) they burn severely; or (3) they cause traumatic neuroses through mental and physical shock. Usually, if they burn severely they do not kill; hence, practically the rule is, if contact with electrical wires does not kill, the victim gets only a burn or a harmless shock. In very rare cases the current seems to affect the nerves or nerve-centers, causing paralysis. The minimum current safe to receive is not definitely known. Probably 800 to 1,000 volts of continuous current, and a third less of alternating current, would not be fatal. The wires for lighting and for power carry the more dangerous currents.

PHOTOGRAPH OF A LIGHTNING FLASH—The accompanying illustration is an exact copy of a photograph of a flash of lightning made by Joseph Gray, at Brixton, England, during a recent thunder storm. The flash presents a most striking and eccentric appearance, gradually dying away at the right-hand side, apparently in the distance, until it becomes too faint to affect the sensitized plate. The zigzag and irregular form of most lightning flashes is a very peculiar circumstance, and is usually explained by supposing that the air in the direct path of the electric current becomes compressed and condensed by its passage, thus increasing its resistance to the current, which is obliged to

change its direction, and pass through air of less density, according to the well-known law that an electric current always follows the path of least resistance. This is one of the most perfect and satisfactory photographs of a lightning flash yet obtained.

Commenting on the subjugation of this great and mysterious force to the uses of mankind, the following statistics eloquently attest the progress of the last decade in the three great branches wherein future improvements may be most reasonably expected: The present electric-railroad equipment in this country represents a value of about \$49,300,000 out of a total of \$164,400,000 for all street railways, of which \$53,900,000 may be apportioned to horse systems, \$49,000,000 to cable, and \$7,400,000 to steam.

In 1882 it was commonly regarded that telephone lines from 50 to 100 miles long, if managed according to the best lights of the time, hardly paid to do business over. In 1892, daily and continuous service was furnished between New York city and Buffalo, a distance of nearly 500 miles. The crowning triumph of long distance telephony was achieved, apparently, when, in 1893, a line was successfully established over a course of nearly 1,000 miles, and conversation was carried on between the citizens of New York and Chicago.

The development of the telegraph belongs properly to an earlier period than the last decade, but much has been done in the last few years in the way of extending the industry, in the introduction of new methods and in the improvement of old ones. The length of wire in use is over 900,000

miles. The capital invested approximates \$100,000,000.

ELECTRO-CHEMICAL ORDER OF THE ELEMENTS. The following table will show the electric order of the majority of the elements which are acted upon by gases and liquids and from which electricity can be generated. It is graduated from the electro-positive to the electro-negative:

<i>Electro-positive.</i>	Tin.	Tungsten.
Potassium.	Bismuth.	Molybdenum.
Sodium.	Copper.	Vanadium.
Lithium.	Silver.	Chromium.
Barium.	Mercury.	Arsenic.
Strontium.	Palladium.	Phosphorus.
Calcium.	Platinum.	Iodine.
Magnesium.	Gold.	Bromine.
Aluminium.	Hydrogen.	Chlorine.
Uranium.	Silicon.	Fluorine.
Manganese.	Titanium.	Nitrogen.
Nickel.	Tellurium.	Selenium.
Cobalt.	Antimony.	Sulphur.
Cadmium.	Carbon.	Oxygen.
Lead.	Boron.	<i>Electro-negative.</i>

ELECTROTYPING. See Britannica, Vol. XXIII, p. 703.

ELECTUARY, a form of medicinal preparation in which the remedy is enveloped or suspended in honey or syrup, so as to make a mixture of thick semi-fluid consistence.

ELEGIT, ESTATE BY, the right in lands which is enjoyed by one who has acquired the land under writ of elegit.

ELEGIT, WRIT OF, a writ whereby a creditor in England can seize the lands of his debtor in satisfaction of his claim. A creditor who has seized the lands is not entitled to take the person of his debtor.

ELEGY: in music, is a composition depicting feeling of mourning, sadness, longing, or ardent desire, and love.

ELEMENTAL SPIRITS beings who, according to the popular belief of the Middle Ages, presided over the four "elements," living in and ruling them. The elemental spirits of fire were called Salamanders; those of water, Undines; those of the air, Syphs; and those of the earth, Gnomes.

ELEMENTS, in astronomy, are those numerical quantities, and those principles deduced from astronomical observations and calculations, which are employed in the construction of tables exhibiting the planetary motions. They include the greatest, least, and mean distances of the planets from the sun, the eccentricities of their orbits; their mean motions, daily and annual, with the motions of their aphelia; and the inclinations of their orbits to the ecliptic; their masses and densities, etc.

ELEPHANT, a geographical term of obvious origin, indicating various localities in Asia and Africa. (1.) Elephant Point, a promontory of Pegu, in Further India. It marks the west extremity of the mouth of the Rangoon, the most easterly arm of the Irrawaddy. It is in latitude, 16° 28' N., and longitude 96° 25' E. (2.) Elephant Bay, an inlet of the Atlantic, on the coast of Benguela, Southwest Africa, in latitude 13° 14' S., and longitude 12° 33' E. (3.) Elephant Island, in Senegambia, about 100 miles up the Gambia. (4.) Elephant River, in the Cape Colony of South Africa. It enters the Atlantic after a course of 140 miles, about latitude 30½° S., and longitude 18° E.

ELEPHANTINE, a small island of the Nile, lying opposite Assouan, the ancient Syene, on the confines of Egypt and Nubia, in 24° 5' N. lat., and 32° 54' E. long. The island was anciently called Abu, or the "ivory island," from its having been the entrepot of the trade in that precious material.

ELEPHANT-SEAL (*Macrorhinus leoninus* or *proposcideus*), also known as the sea elephant, the largest of the seal family (*Phocidæ*), and an inhabitant of the seas of the Southern hemisphere (see

Britannica, Vol. XV, p. 444). It is sometimes 20 feet in length, with a circumference of about 18 feet at the thickest part, which is at the chest, immediately behind the fore-flippers or swimming-paws, the body tapering towards the tail. The color is grayish, bluish-gray, or more rarely blackish-brown. The whole body is covered with very short hair, distributed in patches, giving it a spotted appearance somewhat like watered silk. The swimming-paws are large and powerful, and have five nails, the thumb-nail easily distinguishable from the others; the hind-paws have not even the rudiments of nails, but are beautifully constructed, like the webbed foot of a bird, so as to expand, and increase the power of swimming. The true tail is very short, not more than six inches long. The head is larger in proportion than in many seals; the eyes are very large and prominent, with eyebrows of coarse hair; the whiskers are composed of very long and coarse spirally twisted hairs; there are no external ears; the canine teeth are remarkably large and massive, somewhat assuming the character of tusks. The nose of the males is prolonged into a kind of proboscis.

ELEVATED ROADS. Owing to the increasing difficulties attendant upon intramural transportation, the elevated railroad has, during the last few years, come largely into favor in populous cities. The problem of how best to transport vast numbers of passengers within a very limited space of time was one to which a solution was most desirable. In London it was disposed of by the construction of an underground railway, the chalk formation and consequent excellent drainage rendering the driving of an extended system of tunnels entirely feasible. In Paris the difficulty was met by the building of a circular railroad, operated by steam power and embracing a sufficiently comprehensive territory to materially relieve the congested district. About 15 years ago, an elevated road was erected in Berlin which was operated by cable. This system, was, however, found to be cumbersome and impracticable. As a tentative experiment, however, it had its uses, for capitalists who had hitherto been reluctant to invest in this class of property, seemed to see in the Berlin road possibilities for lucrative returns, and the system has since been expanded by the substitution of a splendidly equipped elevated road operated by electricity. While the intramural termini of the railroads running into London are practically reached by tracks elevated above the streets, these tracks are merely extensions of main lines and cannot correctly be styled city elevated railroads. The beds of these roads are built, for the most part, on long lines of brick arches, of the most substantial character, the space between the spans being devoted to warehouse purposes. Apart from a single line of elevated road which is used in Liverpool to carry freight from the docks, we must look to the United States as the home of the modern elevated railroad; and of the great cities of the Union which have adopted it, New York is undoubtedly at the head. In 1875 an experimental line was projected from Fourteenth street to Cortlandt street on Greenwich street. It was finished in the summer of that year, and a train of cars loaded with brick and stone was run over the structure. Nearly the entire length of the line had been traversed when the rails spread, allowing the cars and engine to fall to the street below. The stockholders of the company were so greatly discouraged by this mishap that it was not until the following year the road was opened for business. This road was regarded as insubstantial and unsafe by the general public, and was not largely availed

of until it was remodeled and strengthened. Dr. Gilbert, the inventor of a greatly improved system, was the next to attempt to revolutionize urban travel and a few years later the Gilbert Elevated Railway Company was formed, which erected a permanent way from the Battery along Church street and Sixth avenue to Central Park. After much litigation the original proprietors sold out to the Metropolitan Railroad Company, a wealthy corporation, which extended the road to Harlem. The Third avenue and the Second avenue roads were built later. Chicago has also adopted this system and there have been constructed within the city limits two roads, the Lake Street Elevated, not yet running, and the South Side Alley Road, which has been for some months in operation. Another alley road has been projected for the west side, which will run nearly on the line of Van Buren street, and extend some miles westward. The general character of all these structures is the same, and consists of a system of angle irons strongly bolted and running either transversely, horizontally or longitudinally. It is predicted that elevated roads will ultimately entirely supersede other methods of rapid transit in vogue in great cities.

ELEVENTH, in music, is the interval of the octave above the fourth.

ELGIN, a city of Illinois, located in Kane county, on the Fox River, 36 miles northwest of Chicago. It is the center of a large dairy business, and has important manufactures, especially of watches, carriages, washing-machines, shoes, farming implements, etc. The Elgin National Watch Works employ 3,000 skilled hands, and manufacture 1,800 watches daily. In addition to twelve public schools there is an academy, a Catholic seminary, a school of manual training, and a public library. The Northern Illinois Hospital for the Insane is located at Elgin. The growth of the city has been very rapid during the last decade. Population in 1880, 8,787; in 1890, 17,429.

ELIAS, MOUNT ST., a mountain on the north west coast of America, in latitude $60^{\circ} 18'$ and in longitude $140^{\circ} 30' W$. It rises about 17,860 feet, or almost $3\frac{1}{2}$ miles above the sea, being visible to mariners at a distance of 50 leagues.

ELIE, or **ELY**, a pretty little watering-place of Scotland, County of Fife, 23 miles northeast of Edinburgh (34 by rail). Population, 917.

ELIOT, CHARLES WILLIAM, an American educator, born in 1834. In 1854 he was appointed tutor in mathematics at Harvard; in 1858 became assistant professor in mathematics and chemistry; in 1861 taught chemistry in Lawrence Scientific School; from 1863 to 1865 studied chemistry in Europe; in 1865 became professor of analytical chemistry in the Massachusetts Institute of Technology, and in 1869 was elected president of Harvard University. He is a member of many scientific and literary bodies, and is a popular public speaker. He has written various works on chemistry.

ELIOT, GEORGE. See CROSS, MARIAN, in these Revisions and Additions.

ELIOT, JOHN (1754-1813), an American clergyman. He began to preach in 1776; was for a time chaplain of a Boston regiment, and from 1779 till his death was pastor of the New North Church of Boston. He published a *Biographical Dictionary of Eminent Characters in New England*.

ELIOT, SAMUEL, an American author, born in 1821. From 1839 to 1841 he was in a Boston counting-house; spent four years in foreign travel; on his return taught private school; was professor of political science and history in Trinity College, Hartford, Conn., in 1856-64; its president, 1860-64; lecturer on constitutional law and political science,

1864-74; lectured at Harvard in 1870-73; was master of the Boston Girls' High School in 1872-76; superintendent of the Boston public schools in 1878-80; was an overseer of Harvard in 1866-72; and in 1868-72 was president of the American Social Science Association. He has published many works on historical and other subjects.

ELIXIR, a term in pharmacy which has come down from the days of alchemy, and is applied to various preparations, consisting mostly of solutions of aromatic and bitter vegetable substances in spirits of wine. The term tincture is now more common.

ELIZABETH, MADAME (1764-94), a French princess, sister of Louis XVI.

ELIZABETH, a city of New Jersey, and county-seat of Union county (see *Britannica*, Vol. VIII, pp. 145-46). Although largely a place of residence for New York business men, Elizabeth has numerous manufactures, some of them of national importance. A sewing machine company in this city has a factory which occupies 22 acres and employs 3,000 men, in the manufacture of machines. The manufacture of cordage is another industry which has grown to large proportions. The city is supplied with excellent water, obtained from the Elizabeth River at its source at the base of the mountains 20 miles distant. The high school building, presented to the city by one of its citizens, Mr. Joseph Battin, is one of the finest school buildings in the State. The city has a general hospital and dispensary, a home for aged women, and an orphan asylum. Library Hall has recently been completed at a cost of \$50,000, and contains a large library. The public school system is divided into five branches of instruction: normal training for teachers, manual training, high school, grammar schools, and primary schools. In addition to these there are numerous private boarding and day schools, including a business college, with a preparatory college course. Population in 1880, 23,229; in 1890, 37,683.

ELIZABETHAN ARCHITECTURE, a term applied to the mixed style which sprang up on the decline of Gothic architecture. By some it is called the Tudor style, but that name belongs more correctly to the Perpendicular, or latest kind of Gothic.

ELIZABETH CITY, the county-seat of Pasquotank county, N. C., on Pasquotank River. It has a deep, safe harbor, which can be entered by large vessels; has a park, State normal school, planing-mill, shingle factories, and cotton factories. It is 46 miles south of Norfolk, Va., with which it is connected by rail. Population (1890), 3,251.

ELIZABETH ISLANDS, the name given to 16 small islands off the coast of Massachusetts between Buzzard's bay and Vineyard sound.

ELIZABETHTOWN, the county-seat of Essex county, N. Y., on Bouquet River, 125 miles north of Albany, situated in the vicinity of iron mines.

ELIZABETHTOWN, a village and county-seat of Hardin county, Ill., on the Ohio River, situated in a lead-bearing region.

ELIZABETHTOWN, a railroad junction and county-seat of Hardin county, Ky., 42 miles southwest of Louisville.

ELIZABETHTOWN, a village of Lancaster county, Pa., 18 miles northwest of Lancaster city. It manufactures farming implements.

EL-KHARGEH, capital of the Great Oasis, Upper Egypt, situated in latitude 25° 28' N., longitude 30° 40' E. In the vicinity of the town are numerous ruins, among which are those of a temple; there is also a remarkable necropolis. Population, 6,000.

ELKHART, a city of Indiana, situated at the confluence of the St. Joseph and Elkhart Rivers, in Elkhart county, in the northern part of the State. The town was settled in 1832, and incorporated as a city in 1875. The streets are well paved and lighted with gas and electricity. The principal manufactures are musical instruments, flour, starch, paper, carriages; it has iron foundries and planing mills. The locomotive shops of the Lake Shore railroad are located here. Population in 1880, 6,953; in 1890, 11,370.

ELKHORN, a railroad junction and county-seat of Walworth county, Wis. It is situated in a rich farming district. Pop., 1,447.

ELKHORN RIVER rises in the north-eastern part of Nebraska, flows southeast, and enters the Platte River. It is about 250 miles long.

ELK POINT, a railroad junction and county-seat of Union county, South Dakota, on the Missouri river, 21 miles northwest of Sioux City.

ELK RIVER, the county-seat of Sherburne county, Minn., situated 38 miles northwest of St. Paul, and on the Elk and Mississippi Rivers. It has many manufactures, and its principal business is lumber, stock and grain. Pop., 769.

ELK RIVER rises in Rich Mountains in West Virginia, flows westward for 150 miles and enters the Great Kanawha River at Charleston.

ELKTON, the county-seat of Cecil county, Md., at the head of navigation on Elk River, 52 miles northeast of Baltimore. Flour, iron and paper are here manufactured. The place was settled by Swedes in 1694.

ELL, a measure of length now little used. It was originally taken in some vague way from the arm, and hence has been used to denote very different lengths. The English ell, as a measure of cloth, is equal to five-quarters of a yard.

ELLAND, a town of England, in the West Riding of Yorkshire, on the river Calder, three miles southeast of Halifax by rail. It has cloth-mills, and there are valuable stone-quarries in the vicinity. Population, 3,278.

ELLENRIEDER, MARIE, a female painter of very high excellence, born at Constance in 1791, studied in Munich, and in 1820 went to Rome to perfect her knowledge of art. On her return to Germany she painted a *Martyrdom of St. Stephen* as an altar-piece for the Roman Catholic Church at Karlsruhe. She was afterwards appointed court-painter at Munich, but subsequently fixed her residence at Constance, and devoted herself exclusively to her profession. Among her principal pieces are the *Transfiguration of St. Bartholemey*, *Christ Blessing Little Children*, *Mary and the Infant Jesus*, *Joseph and the Infant Jesus*, *St. Cecilia*, *Faith*, *Hope and Charity*, and a *Madonna*.

ELLENVILLE, a thriving village of Ulster county, N. Y., 30 miles west of the Hudson River, situated at the foot of Shawangunk Mountains. It has fine public and private buildings, is a favorite summer resort, and the seat of Ulster Seminary. Glass, cutlery, leather, stoneware pottery, and boats are here manufactured. Population, 2,881.

ELLERY, WILLIAM (1727-1820), a Signer of the Declaration of Independence. He began the practice of law in 1770; became a member of the Continental Congress in 1776, continuing in office till 1786, with the exception of the years 1780 and 1782; was commissioner of the Continental loan office for Rhode Island in 1786; for a time was chief justice of the Rhode Island superior court; and from 1790 till his death was collector of Newport.

ELLETT, CHARLES (1810-62), an American civil engineer. After spending some time in engineering pursuits in the United States he completed his

education in Europe. He was connected for a time with various railroads in America, and was chief engineer of the James and Kanawha canal. In 1842 he built the wire suspension bridge across the Schuylkill River at Philadelphia, the first of its kind on the continent. In 1847 he planned and built the suspension bridge over the Niagara River, and later built a suspension bridge at Wheeling, Va. He afterwards engaged in numerous important engineering works, and in 1861 was commissioned colonel of engineers in the army. While on duty on the Mississippi River, off Memphis, he received a musket-ball wound above the knee, from the effects of which he died.

ELLCOTT, CHARLES JOHN, bishop of Gloucester and Bristol, born at Whitwell, near Stamford, April 25, 1819. He graduated from Cambridge University in 1841, and was elected fellow of St. John's College. In 1848 he became rector of Pilton, Rutlandshire, and professor of divinity at King's College, London, in 1858; Hulsean lecturer at Cambridge in 1859, and Hulsean professor of divinity the year after. He was nominated dean of Exeter in 1861, and raised to the episcopal bench in 1863. Dr. Ellicott was chairman for eleven years of the New Testament Revision Committee, and he is well known as a commentator on the Epistles of the New Testament.

ELLCOTT CITY, the county-seat of Howard county, Md., on the Patapsco River, 10 miles southwest of Baltimore. It has two cotton factories, a large flouring mill, a barrel factory, machine shop, a foundry, and three colleges. Population, 1,485.

ELLCOTTVILLE, a village of Cattaraugus county, N. Y., on Great Valley Creek, 44 miles southeast of Buffalo, on the Rochester and State line railroad. Population, 852.

ELLIOT, JEAN (1727-1805), the author of *The Flowers of the Forest*, a touching lyric on the disaster of Flodden. The greater part of her life was spent in Edinburgh.

ELLIOTT, ROBERT WOODWARD BARNWELL (1840-87), an American P. E. bishop. He entered the Confederate army at the beginning of the civil war, and attained the rank of major. In 1868 he took deacon's orders; was ordained priest in 1871, and the same year became pastor of St. Philip's church in Savannah, Ga. In 1874 he was consecrated missionary bishop of western Texas.

ELLIOTT, STEPHEN (1771-1830), an American naturalist. In 1793 he became a member of the legislature of South Carolina, and continued in office until 1812, when he became president of the bank of the State. He was one of the founders of the Literary and Philosophical Society of South Carolina; in 1825 was instrumental in the establishment of the State Medical College, and was its professor of natural history and botany. He published a work on *The Botany of South Carolina and Georgia*.

ELLIOTT, STEPHEN, JR. (1806-66), an American P. E. bishop, son of the naturalist. He practiced law from 1827 to 1833; was ordained deacon in 1835; was professor of sacred literature in South Carolina College; took priest's orders in 1836; became first bishop of the diocese of Georgia in 1840; in 1841 was made rector of St. John's church, Savannah, and in 1844 became provisional bishop of Florida. Subsequently he was rector of Christ's church, Savannah, until his death.

ELLIOTT, WILLIAM, a lawyer, born in Beaufort, S. C., Sept. 3, 1838. He was educated at Beaufort College, Harvard University, and the University of Virginia; entered the profession of law in Charleston, S. C., in 1861, and served as an officer in the Confederate army during the war of the

Rebellion. In politics he is a Democrat, and was elected a member of the State legislature and intendant of Beaufort in 1866; was a delegate to the Democratic National Convention in 1876 and 1888, and a Democratic Presidential elector for the State at large in 1880. He was elected a Representative from the Seventh Congressional District of South Carolina to the 50th Congress; was declared elected to the 51st Congress, but was unseated by the House of Representatives. He was elected from the same district to the 52d Congress in 1890.

ELLIPSIS, a term used in grammar and rhetoric to signify the omission of a word necessary to complete the expression or sentence in its usual form. The object of ellipsis is shortness and impressiveness.

ELLIS, ALEXANDER JOHN (formerly Sharpe, the name having been changed in 1825), F. R. S., English philologist, born at Hoxton, near London, June 14, 1814; studied at Shrewsbury and Eton, graduated with high honors at Trinity College, Cambridge, in 1837, and studied law in the Middle Temple. He has published *The Alphabet of Nature* (1845); *Essentials of Phonetics* (1848); *Early English Pronunciation* (1869); *Speech in Song* (1878); *Basis of Music*; and has translated Ohm's *Spirit of Mathematical Analysis* and Helmholtz's *Sensations of Tone as a Physiological Basis for the Theory of Music*.

ELLIS, GEORGE EDWARD, an American clergyman, born in 1814. He was ordained in 1840 as pastor of the Harvard Unitarian church, Charlestown, Mass., remaining there until 1869; was professor of systematic theology in Harvard Divinity School in 1857-63; was at one time editor of the "Christian Register," and later of the "Christian Examiner." In 1887 he became president of the Massachusetts Historical Society. He is the author of many works, principally of a biographical or historical nature.

ELLIS, ROBINSON, an English classical scholar, born at Barming, Kent, Sept. 5, 1834, and educated at Walthamstow, at Rugby, and at Oxford. He was elected a fellow of Trinity College, Oxford, and there remained till 1870, when he became professor of Latin in University College, London. Six years later he returned to Oxford. He has contributed a number of philological articles to English and American periodicals, and has published critical editions of the *Ibis* of Ovid and of the text of Catullus.

ELLORE, a town in the Godavari district, Madras, India, on the Jammaler River, 225 miles north of Madras, with manufactories of woolen carpets and saltpeter. The heat is very oppressive, reaching 110° F. in the shade. Population, 25,092.

ELLSLER, FANNY, born in Vienna, Austria, June 23, 1810; died Nov. 27, 1884. She became famous as a dancer in nearly every European country and in the United States. Her sister Therese (1808-1878) was almost as well known as a dancer.

ELLSWORTH, EPHRAIM E., born in New York State, April 23, 1837; killed in Alexandria, Va., May 24, 1861. He organized a regiment of zouaves, of which he was Colonel. At Alexandria he tore down a Confederate flag from an hotel and was shot dead by the proprietor, Jackson, who was immediately killed by a soldier.

ELLSWORTH, a town of Kansas, and county-seat of Ellsworth county. It has good water-works, parks, schools, churches, and mills. Rock salt has recently been here discovered 730 feet below the surface of the ground. Population (1890), 1,620.

ELLSWORTH, the county-seat of Pierce county, Wis., 40 miles southeast of St. Paul, Minn. It has a stove-mill and steam saw-mill.

ELLSWORTH, OLIVER (1745-1807), an American jurist. He was admitted to the Connecticut bar in 1771; at the outbreak of the Revolution was chosen to represent Windsor in the general assembly; in 1778 took his seat as a delegate to the Continental Congress, and from 1780 to 1784 was a member of the governor's council. In 1783 he was reelected to Congress, but declined to serve. He became judge of the Connecticut superior court in 1784, and in May, 1787, was made a member of the Federal convention at Philadelphia. In 1789 he was made a United States Senator; from 1796 to 1800 was chief justice of the United States Supreme Court; 1800-01 was at the head of a commission to negotiate with France; and in 1802 was again elected a member of the governor's council. In 1807 he again became chief justice of the Connecticut Supreme Court.

ELLWANGEN, a town of Württemberg on the Jagst River, 55 miles north of Ulm by rail. The old castle of Hohen-Ellwangen has been used as an agricultural school since 1843. Population, 4,793.

ELM, a village of Switzerland, at the head of a valley in the canton of Glarus. In 1881 the whole of the northern side of Tshingel Peak (10,230 feet) crashed down upon it, destroying a large part, and filling the valley with débris.

ELMALU, a town of Asia Minor, in the province of Konieh, on the Lycian tableland, 45 miles west of Adalia. It has manufactories of red leather and dye-works. Population, 25,000, chiefly Greeks and Armenians.

ELMENDORF, JOHN JAMES, an American educator, born in 1827. In 1848 he became instructor of mathematics at Columbia College, and in 1868 professor of philosophy in Racine College, Wis. Among his works are: *Manual of Rites and Ritual*; *History of Philosophy*; and *Outlines of Logic*.

ELMIRA, a city of New York, and county-seat of Chemung county (see *Britannica*, Vol. VIII, p. 153). Six railroads center here: viz., New York, Lake Erie and Western; the Delaware, Lackawanna and Western; Northern Central; Lehigh Valley; Elmira, Cortland and Northern; and the Tioga. The city contains 90 miles of streets, most of which are paved, lined with handsome shade trees, and well lighted with gas and electricity. The area of the city is 3,000 acres. A board of trade was organized in 1879. Manufacturing interests are numerous and extensive, giving employment to about 4,000 persons. The educational advantages of Elmira are excellent. The city has over \$3,000,000 invested in school property. There are 9 public schools, 4 private select schools, 3 commercial colleges, and the Elmira Female College (Presbyterian), with an endowment of \$100,000. Among the charitable institutions are the Arnot-Ogden Memorial Hospital, Home for the Aged, Orphan's Home, Industrial School, and the Anchorage. The city contains six parks, among them Eldridge Park, with an area of 89 acres; Riverside Park, 40 acres; and Grove Park, 10 acres. Population in 1880, 20,541; in 1890, 28,070.

ELMORE, a village of Ottawa county, Ohio, on Portage River, 16 miles from Toledo and 20 miles from Lake Erie.

ELMO'S FIRE, Sr., the name of an electric display sometimes seen, during thunder storms, of a brush or star of light at the tops of masts, spires, or other pointed objects. See *Britannica*, Vol. XIV, p. 633.

ELMSHORN, a town of Denmark, in the duchy of Holstein, 20 miles northwest of Hamburg, situated on both banks of the Kruckau, a navigable stream, and feeder of the Elbe. It is well built.

has considerable manufactures, and an active trade in grain; it has a boat-building yard and tanneries.

ELMSLEY, PETER, classical scholar, born in 1773, educated at Oxford, where he graduated B. A. in 1794, and in 1823 was appointed principal of St. Albans Hall, and Camden professor of ancient history. He contributed to the *Edinburgh* and *Quarterly* reviews, but is now remembered only by his valuable critical work on Sophocles and Euripides.

ELMWOOD, a village of Peoria county, Ill., 163 miles southwest of Chicago.

ELOCUTION (*Lat.*, for speaking out), the art of effective speaking, more especially of public speaking. It regards solely the utterance or delivery; while the wider art of oratory, of which elocution is a branch, takes account also of the matter spoken.

ELOGE. When a member of the French Academy dies, it is customary for his successor to deliver an oration setting forth his merits and services. This is called an *éloge*, and a considerable branch of French literature goes by the name.

ELOHIM (Hebr., plural of *Eloah*; Arab., *Ilāh*; Chald., *Eldāh*; Syr., *Alāh*), might, power; in plur., intensified, collective, highest power—great beings, kings, angels, gods, *Deity*. As a *pluralis excellentiæ* or *majestatis*, and joined to the singular verb, it denotes, with very rare exceptions, the One true God. Joined to a plural verb, however, it usually means gods in general, whether including the One or not.

EL PASO, a city of Woodford county, Ill., containing mills, grain elevators, agricultural implement works, and a carriage manufactory.

EL PASO, a city of Texas, and county-seat of El Paso county, situated on the left bank of the Rio Grande River, at one of the great gateways of travel between the United States and Mexico. In 1881 the first railroad reached the city; ten years later five great trunk lines centered here, having their main connections with the Pacific coast, the Mexican capital, and the great grazing and mining regions of the Rocky Mountains. The public schools are excellent. El Paso contains a court house costing \$100,000, a jail costing \$35,000, a handsome city hall, custom house, and a federal building costing \$200,000. There is no city debt. The United States Government has established a military post in the vicinity, the citizens having donated 1,000 acres of land for that purpose. Population in 1880, 730; in 1890, 10,836.

ELPHIN, a bishop's see in Roscommon, Ireland, united to Kilmore in 1833.

ELPHINSTON, JAMES, 1721-1809. A poet and man of letters, was born at Edinburgh, and began life as a teacher near London. He became the close friend of Dr. Johnson, whose *Rambler* he edited in eight volumes. In the face of much public ridicule, Elphinston for years persisted in an attempt to change the orthography of the English language to a phonetic basis.

ELSTER, the name of two rivers of Germany, the White and the Black Elster. The White Elster rises at the foot of the Elster Mountains, on the northwestern boundary of Bohemia, flows in a northerly direction, and falls into the Saale three miles south of the town of Halle, in Prussia. Its chief affluent is the Pleisse from the right. Total length, 110 miles. The Black Elster rises in the kingdom of Saxony, within two miles of Elstra, flows northwest, enters Prussia, and joins the Elbe eight miles southeast of Wittenberg. Length, 105 miles.

ELSTER, KRISTIAN, a Norwegian novelist, born, March 4, 1841, died April 11, 1881. He was author

of *Tora Trondal and Farlige Folk*, both works of great merit. The latter had not yet appeared in print at the time of the author's death. Some short sketches of his were collected and published by Alexander Kjølland in a volume entitled *Solskyer* (1882).

ELSTRACKE, RENOLD, a noted English engraver, born probably in Belgium in the 16th century. His engravings, including portraits of the kings of England, of Mary Queen of Scots, and other notabilities, are much sought after, chiefly from their rarity.

ELSWICK, a township on the outskirts of Newcastle, England. The works of Sir W. G. Armstrong, Mitchell & Co., are located here. The engineering section of these works dates from 1847, the ordnance works from 1857. The frontage on the river is about one mile, the entire area about 125 acres, and 14,000 people are employed. Population, 34,642.

ELTON, a shallow, oval-shaped salt lake of Russia, with an area of 62 square miles, in the government of Astrakhan, the center of it being in lat. 48° 56' N., and long. 46° 40' E. In spring the lake has a layer of almost pure salt crystals, from 2 to 4½ inches thick. The annual yield is about 96,000 tons, or about one-seventh of the total production of Russia.

ELTON, CHARLES ISAAC, an eminent jurist and ethnologist, of Whitley, Somerset, England, born in 1839. He was educated at Cheltenham and Balliol College, Oxford, became fellow of Queen's College in 1862. Was called to the bar at

Lincoln's Inn in 1865, and afterwards became Q. C. He was returned to Parliament as a Conservative in 1884, was defeated in 1885, but again returned the year after. His books had already gained him reputation as a jurist, when he placed himself in the front rank of English ethnologists by his *Origins of English History* (1882).

ELUTRIATION is the term applied to the process of separating, by means of water, the finer particles of earths and pigments from the heavier portions. This process is much employed in the manufacture of the materials used in pottery and in the preparation of pigments.

ELWES, JOHN, M. P. (1714-89), a famous English miser. He would walk miles in the rain to save the hire of a conveyance, or risk his life to save paying a penny at a turnpike. He died at Marcham, Berkshire, leaving property worth two and a half millions of dollars.

ELYRIA, the county-seat of Lorain county, Ohio, finely situated at the junction of the east and west branches of the Black River, 7 miles south of Lake Erie. It contains a telegraph college, gas factory, has excellent water power, and manufactures cheese, building-stone, grindstones, tobacco, screws, and confectionery. Pop., 5,611.

ELZE, FREDERICK KARL, Shakespearian scholar, born at Dessau, May 22, 1821, died at Halle, Jan. 21, 1889. He studied at Leipzig and Berlin, devoting especial attention to English literature. In 1875 he was appointed to the newly established chair of English language and literature at Halle.

EMANCIPATION, CHRONOLOGICAL OUTLINE OF. For general article on the subject of Slavery, the Slave-trade, and Emancipation, see *Britannica*, Vol. XXII, pp. 129-144. The following chronological historic outline furnishes a convenient summary of facts, classified by countries, relating to the prevalence of slavery at different periods, and indicating the progress and success of the vigorous efforts put forth in behalf of universal emancipation:

The custom of selling men and women into bondage was introduced into Egypt, Arabia, and other countries of the East, from Chaldea.

The Jews were permitted to make bondsmen of the captives taken in war, and also to make slaves of insolvent debtors—the service to continue until the debt was paid, with the provision that all slaves should be given their pardon in the fiftieth, or "Jubilee" year, and that those whose slavery was the result of debt should all be free at the close of a period of 7 years.

In Greece, in the days of Homer, all prisoners were regarded as slaves (1000 B. C.). In Attica alone there were 400,000 slaves (317 B. C.). When Alexander razed Thebes he sold the whole people for slaves (335 B. C.).

In Rome many thousand prisoners were held as slaves, and in many cases were chained at the galley oars in perpetual servitude. It was a common habit to find slaves chained to the gate of a rich man's house to admit the invited guests (265 B. C.—250 A. D.).

C. Polto, the Roman, was accustomed to throw any offending slaves into his ponds to fatten his lampreys (42 B. C.).

The first Janissaries (an order of Turkish infantry) were selected from among the Christian slaves seized in battle (1330).

In England, under Saxon and Norman rule, the peasantry were commonly sold for slaves. Children were sold in the Bristol market the same as cattle, for home use or for exportation to Ireland, Scotland, and other countries, and slaves were entailed by bequest the same as other property.

The English slave-trade was begun by Sir John Hawkins and other Englishmen. First expedition took place in 1562. England employed 130 ships in the slave-trade, and carried 42,000 slaves in 1786.

In the time of the Stuarts several English slave-trading companies were chartered by the English government, and Charles II and James II were members of some of them, while James II was at the head of one (1660-80).

The privilege of supplying slaves to the American Colonies was conferred by special grant to certain English companies, with which many persons of royal blood were connected (1681-1750).

So great were the evils of slavery in England that several laws relating to it were enacted in 1371-1814.

THE MODERN SLAVE-TRADE.

The slave-trade as a department of commerce began in this wise: In 1441 two officers of an exploring party, under the leadership of Prince John (third son of King John I), of Portugal, seized some Moors and conveyed them to Portugal. A year later these Moors were allowed to ransom themselves, and among the goods given by them were 10 black slaves. The value of such persons in commerce was thus suggested, and three years later a large company was organized to engage in the business. The claim of the managers was that the traders did not enslave the Africans, but merely transferred them from one condition of servitude to another, which they regarded as less wretched. The first 4 slaves captured by the Portuguese were in 1444.

A large number of slave stations were opened in Africa, about 1445-1495.

Generally prevalent in a belt of African country, extending about 900 miles on each side of the Equator, for 310 years (1485-1795).

Accredited authorities estimated that the slave-trade carried on by Europeans had involved a total of 90,000,000 of Africans up to 1784.

The slaves taken from Africa in a single year numbered 104,000—namely, in 1768.

* A statute was enacted, by Edward VI, that a runaway, or any one who lived idly for three days, should be brought before two justices of the peace, and marked V with a hot iron on the breast, and adjudged the slave of him who bought him for two years. He was to take the slave and give him bread, water, or small drink, and refuse meat, and cause him to work by beating, chaining, or otherwise; and if, within that space, he absented himself fourteen days, he was to be marked on the forehead or cheek by a hot iron with an S, and he was his master's slave forever; second desertion was made felony. It was lawful to put a ring of iron round his neck, arm, or leg. A child might be put apprentice, and, on running away, become a slave to his master (1547).

Queen Elizabeth ordered her bondsmen in the western countries to be made free at easy rates (1574).

Serfdom was finally extinguished in 1660, when tenures *in capite*, knight's service, etc., were abolished.

When the Spaniards conquered Mexico they found in operation a well-defined "Aztec code" relating to slavery. This code recognized several classes of slaves: prisoners of war, which were generally reserved for sacrifice; criminals, public debtors, and those who, in poverty or extreme peril, had voluntarily resigned their freedom; and children who were sold by their parents. Slavery in Mexico, however, was so regulated by the Aztec laws as to be much less severe than in most countries, except in case of prisoners taken in battle, or of those slaves who were refractory or vicious—these being held for sacrifice. Such was slavery in Mexico in 1521-91.

Documents presented to the British government showed that since 1793, 3,500,000 native Africans had been taken from their homes, and had either perished on shipboard, or had been sold in the West Indies, during the period ending with 1807.

The slaves in the United States in 1800 numbered 697,897; in 1810, 1,191,364; in 1820, 2,009,831; in 1850, 3,204,313; 1860, 4,002,996.

SUPPRESSION OF THE SLAVE-TRADE BY GREAT BRITAIN.

"The Society for the Suppression of the Slave-trade," founded in England by Clarkson, Wilberforce, and Dillwyn, 1787.

Slave-trade question debated in British Parliament (1787). The debate for its abolition continued two days, April, 1791. Mr. Wilberforce's motion lost by a majority of 88 to 83, April 8, 1793.

The trade abolished by British Parliament, March 25, 1807. It is said that about 40,000 slaves were landed at Cuba in 1800.

A treaty between Great Britain and the United States, for the abolition of the slave-trade, was signed April 7; ratified May 20, 1862.

The Spanish government denounced the slave-trade as piracy, November, 1865.

Sir Samuel Baker headed an English expedition to put down slave-trading on the Nile, January, 1870; reported to be partially successful, June 30, 1873. He published *Ismailia*, a history of the expedition, 1874.

The species of slave-trade arose about 1870 in the South Seas; the natives being enticed on board certain British vessels and shipped to Queensland, Australia, and the Fiji Isles; the subject was brought before the British Parliament, 1871-72.

The ship *Carl* (owner, Dr. James P. Murray; master, Joseph Armstrong) left Melbourne for South Sea Isles; it anchored off Malakolo, Solomon's, and Bougainville Isles, and kidnapped many natives as laborers for the Fiji Isles; and within about twenty miles from land the prisoners arose and attempted to set fire to the ship; were fired on; about 50 killed and 20 wounded were cast into the sea. At Melbourne Murray gave evidence, and Armstrong was committed for trial, Aug. 16; master and mate sentenced to death, November, 1872.

Sir Bartle Frere went to Zanzibar on a mission to suppress the East African slave-trade (1872-73).

An act of Parliament, for consolidating with amendment the acts for carrying into effect treaties for the more effectual suppression of the slave-trade, passed Aug. 5, 1873.

Several African kings and chiefs, at Cape Coast Castle, agreed to give up slave-trade, at an interview with Governor Strahan, Nov. 3, 1874.

Slave-trade on the Gold Coast abolished by proclamation of Governor Strahan, Dec. 17, 1874.

Convention with Egypt forbidding the slave-traffic, Aug. 4, 1877.

Col. Gordon's efforts to suppress it in the Soudan reported successful (1879).

Slave-traffic prohibited at West African Conference, Jan. 7, 1885.

Slave-trade in East Africa checked by British cruisers in 1886.

England and Germany proclaim the blockade of East coast of Africa, from Suakin to Zanzibar, for the suppression of the slave-trade, Dec. 2, 1888.

Slave-trade reported nearly extinct in Egypt (only a few slaves remaining), May, 1889.

ABOLITION OF SLAVERY BY GREAT BRITAIN.

Act for the abolition of slavery throughout the British Colonies, and for compensation to the persons hitherto entitled to the services of such slaves by the grant from Parliament of £20,000,000 sterling, passed Aug. 23, 1833.

Slavery terminated in the British possessions; 770,230 slaves became free, Aug. 1, 1834.

Slavery was abolished in the East Indies, Aug. 1, 1838.

In 1853 John Anderson, a runaway slave, killed Septimus Digges, a planter of Missouri, who attempted to arrest him, and escaped to Canada. The American government claimed him as a murderer. The Canadian judges deciding that the law required his surrender, Mr. Edwin James, Q. C. (Jan. 15), obtained a writ of *habeas corpus* for his appearance before the Queen's Bench, and Anderson was discharged on technical grounds.

English Government Commission, consisting of Chief Justice Cockburn and others, reported against permitting the return of slaves to their owners, June 13, 1876.

New Admiralty instruction orders issued by English government, directing that fugitive slaves be received, but not given up; that sea captains use their discretion, so that breach of international faith shall be avoided, Aug. 10, 1876.

SUPPRESSION OF SLAVE-TRADE BY OTHER FOREIGN COUNTRIES.

Slave-trade abolished by Austria in 1782.

French convention declared against all slave-traffic (1794). The allies at Vienna declared against it, February, 1815. Napoleon, in the Hundred Days, abolished the trade, March 29, 1815.

English treaty for its suppression with Spain, 1817; with the Netherlands, May, 1818; with Brazil, November, 1826.

In June, 1857, the French government gave permission to M. Regis to convey free negroes from Africa to Guadeloupe and Martinique, French colonies. This having led to abuses and consequent troubles, was eventually given up in January, 1859.

EMANCIPATION OF SLAVES IN THE UNITED STATES.

The Massachusetts Supreme Court decided that the "Bill of Rights," declaring that "All men are born free and equal," is a bar to slaveholding in that State (1783).

Congress unanimously passed an ordinance "for the government of the territory to the northwest of the Ohio," containing an "unalterable" provision forbidding slavery or involuntary servitude in the said territory, July 13, 1787.

Missiana, in which slavery existed, was purchased in 1803. The *Missouri Compromise* (drawn by Henry Clay, of Kentucky), was passed by Congress, permitting slavery in Missouri, but prohibiting it in all States thereafter to be created west of the Mississippi River and north of 36° 30' north latitude, March 3, 1820.

California admitted as a State, but the "Fugitive Slave Act," passed, 1850.

The "Kansas-Nebraska Bill" passed, leaving the people of those Territories to decide whether they should be organized as slave States (1854).

The judgment in the Dred Scott case rendered by the U. S. Supreme Court. Dred Scott was claimed as a slave in a free State; four judges declared for his freedom, five against it, causing great dissatisfaction throughout the Free States, March, 1857.

John Brown's failure (at Harper's Ferry) to destroy slavery by creating a slave revolution, Oct. 16, 1859.

Abraham Lincoln elected President of United States, Nov. 4, 1860.

South Carolina passed the ordinance of secession, 1860. Slavery abolished in District of Columbia, April 13, 1862.

President Lincoln issued his proclamation declaring the abolition of slavery in the Southern States, to take effect Jan. 1, 1863, provided that those States have not returned to the Union, Sept. 22, 1862.

President Lincoln proclaims the freedom of all slaves in the Southern States, except in parts held by the U. S. Army, Jan. 1, 1863. Congressional action needed to give it effect, in the latter part of the year.

Fugitive Slave act repealed by Congress, June 13, 1864.

The Confederate Congress decreed the arming of the slaves, Feb. 22, 1865.

Surrender of the Confederate Army under Gen. Lee, April 9, 1865.

Union flag replaced on Fort Sumter, April 14, 1865.

President Lincoln assassinated, April 15, 1865.

Several Southern States pass an ordinance annulling secession and abolishing slavery, September, October, and November, 1865.

President Johnson vetoed the Freedman's Bureau Bill, Feb. 1, 1866, and also the bill for securing to the colored people civil rights equal in all respects to those of the whites, March 27, 1866.

Congress passed the "Equal Rights Bill" over the President's veto, April 9, 1866.

Bill giving to colored persons in the District of Columbia the full right of suffrage, passed Dec. 13, 1866.

ABOLITION OF SLAVERY IN OTHER COUNTRIES.

Serfdom in Prussia abolished by Frederick I. in 1702.

Serfdom in Denmark abolished by Christian VII, 1766.

Serfdom in Germany abolished by Joseph II, 1789.

Slave-trade abolished in Jamaica, May 1, 1807.

All slaves in Jamaica emancipated, Aug. 1, 1834.

Slavery abolished in Dutch West Indies, July 1, 1861.

Decree issued in Brazil declaring that all children born hereafter to slaves shall be free, and that all slaves shall be free 20 years later, Sept. 27, 1871.

Decree issued in Brazil declaring all slaves to be free by enlisting in the army, from November, 1871.

Porto Rico issued decree abolishing slavery, March 23, 1873.

Portugal issued decree suppressing slavery in the colonies of St. Thomas, etc., February, 1876.

Spanish Senate voted gradual emancipation, Dec. 24, 1879; same bill passed by Deputies, Jan. 21, and act promulgated, Feb. 13, 1880.

Egypt issued decree abolishing slavery, July 31, 1881.

Russian decree abolishing serfdom in the imperial domains issued by Nicholas I. in 1842.

Imperial edict providing for the entire abolition of serfdom in the whole Russian empire, proclaimed by Alexander II, March 3, 1861. The following numbers are from Marshall's tables:

RUSSIAN SERFS EMANCIPATED IN 1861.

	Male.	Female.	Total.
Crown serfs.....	11,168,000	11,683,000	22,851,000
Appanage.....	1,624,000	1,702,000	3,326,000
Held by nobles.....	10,674,000	11,081,000	21,755,000
Total.....	23,466,000	24,466,000	47,932,000

NOBLEMEN'S SERFS IN 1861.

Nobles.	Serfs.	Average.
23,100	18,575,000	802
36,150	2,520,000	70
43,800	660,000	15
103,050	21,755,000	211

COST OF REDEMPTION.

Mortgages remitted.....	\$152,000,000
Government scrip.....	101,150,000
Appanage.....	52,330,000
Paid by serfs.....	19,500,000
Balance due.....	\$325,000,000

Indemnity award..... \$325,000,000

The indemnity to the nobles was about \$15 per serf. The lands were mortgaged to the state until 1912. The lands ceded to crown serfs were mortgaged only till 1901. The above item of "mortgages remitted" is the amount due by nobles to the Imperial Bank and canceled.

LANDS HELD BY FREED SERFS IN 1879.

Title.	Holders.	Acres.	Average Acres.
Crown-gift.....	6,117,000	84,200,000	14
Appanage.....	1,625,000	30,200,000	18
Purchase.....	10,137,000	65,500,000	6½
Beggar-lots.....	1,840,000	6,440,000	3½
Total.....	19,719,000	186,340,000	9

In return for crown-gift the holders have to pay 50 per cent. extra poll-tax till 1902. Beggar-lots are lands given gratis by the nobles to the peasants, rather than sell farm-lots at \$5 per acre to them.

AUSTRIAN SERVITUDE (1840).

	Value.
Labor (two days a week).....	\$35,000,000
Tithe of crops, etc.....	12,000,000
Male tribute.....	1,400,000
Female tribute, spun wool.....	1,800,000
Powl, eggs, butter.....	1,000,000
Total.....	\$51,200,000

There were 7,000,000 serfs, whose tribute averaged more than \$35 per head, which was, in fact, the rent of their farms. Some Bohemian nobles had as many as 10,000 serfs. The redemption was effected by giving the nobles 5 per cent. government scrip, and land then rose 50 per cent. in value.

GERMAN SERFS.

In 1848 the state took 60,000,000 acres from the nobles, leaving them still 25,000,000 acres, and gave the former among the serfs. Indemnity as follows:

1. Government scrip, \$300 for each serf family, to nobleman.
2. Land-tax, \$15 per annum, transferred to peasant.
3. Interest, \$35 per annum for 47 years, to be paid by peasant to the state, being 4 per cent. on cost of redemption.

EMANCIPATION IN BRITISH COLONIES IN 1834.

Colonies	Number.	Indemnity.	Per Head.
Jamaica.....	311,700	\$6,152,000	\$100
Barbadoes.....	83,000	1,721,000	105
Trinidad.....	22,300	1,039,000	250
Antigua, etc.....	172,083	3,421,000	100
Guiana.....	84,900	4,237,000	265
Mauritius.....	68,000	2,113,000	155
Cape of Good Hope.....	38,400	1,347,000	185
Total.....	780,393	\$20,000,000	\$130

SLAVERY IN BRAZIL.

Provinces.	Slaves.	Population.	Slave Ratio, per cent.
Mines.....	370,400	2,039,000	18
Rio Janeiro.....	341,600	1,057,700	32
Bahia.....	167,800	4,380,000	12
San Paulo.....	156,600	837,400	19
Pernambuco.....	89,100	841,500	11
Maranhão.....	74,900	359,100	21
Rio Grande-do-Sul.....	67,800	434,800	16
Various.....	242,600	1,890,900	8
Total.....	1,510,800	9,930,400	15

There were 805,000 male and 700,000 female slaves held by 41,000 owners, averaging 37 to each owner. In 1832 the total number of slaves was 1,300,000, representing a market value of \$520,000,000. It is probable there will be no slaves remaining in 1900.

EMANUEL, or IMMANUEL, the symbolical name of the child announced by Isaiah to Ahaz and the nation, and applied by St. Matthew to the Messiah born of the Virgin.

EMBA, a river of the Asiatic Russian government of Orenberg, in the Kirghiz territory, rising at the western base of the Mugadshar Mountains, flowing southwest, and entering the Caspian Sea after a course of about 450 miles.

EMBATERION, a war song of the Spartans, which was accompanied by flutes, and which they sang marching in time, and rushing on the enemy. The origin of the embaterion is lost in antiquity.

EMBATTLED, or IMBATTLED, one of the partition lines in heraldry, traced in the form of the battlements of a castle or tower.

EMBLEM, a representation of an object intended to signify or indicate to the understanding something else than that which it directly represents to the eye. The meaning of the emblem rests upon its secondary, not its primary signification. Emblem is often used in a sense synonymous with symbol.

EMBLEMATA (Gr.), the works of art with which gold and silver vessels were decorated by the ancients. These sculptured figures were generally executed either in the precious metals or in amber. They were called crustæ by the Romans, though the Greek word was also used.

EMBLICA, a genus of plants of the natural order *Euphorbiaceæ*, having a fleshy fruit. *E. officinalis* is a tree found in most parts of India, with a crooked stem, thinly scattered spreading branches, long narrow leaves, minute greenish flowers, and a globular fruit, about the size of a gall-nut, which is a source of tannin.

EMBOUCHURE (Fr.), that part of a wind instrument to which the lips are applied to produce the sound. The term embouchure is also applied to the mouth of a river.

EMBOWED, the heraldic term for anything bent like a bow—as, for example, the arm of a man.

EMBRACERY: in the law of England, the offense of influencing jurors by corrupt means to deliver a partial verdict. Not only persons attempting to influence the jury, but also jurors themselves attempting unduly to bias the minds of their fellows, are guilty of embracery. The using of indirect means in order to be sworn as a juror is also embracery.

EMBROCATON (Gr. *en*, into, and *brecho*, I wet), the same as liniment.

EMBRYOTOMY, a division of the fetus into fragments; to extract it by piecemeal; when the narrowness of the pelvis or other faulty conformation opposes delivery.

EMBURY, PHILIP (1729–75), an Irish American preacher. He became a local preacher in 1758; in 1766 began to hold services in New York city, and

he probably presided over the first Methodist congregations formed in the United States. The first Methodist church was built under his charge in 1768, and he afterwards preached there gratuitously. He went to Salem, N. Y., in 1769, where he preached on Sunday, and worked as a carpenter during the week. He organized the first Methodist society within the bounds of what is now Troy conference.

EMERITUS, a term applied originally to a Roman soldier who had served out his time, and been discharged on something equivalent to our half-pay. It is now employed to designate certain functionaries, such as professors, who have been honorably relieved from the duties of their office, on account of infirmity or long service, and who are usually granted a retiring allowance.

EMERSON, the reappearance of one heavenly body from behind another, after an eclipse or occultation. Minutes or scruples of emersion are the arc of the moon's orbit passed over by her center, from the time she begins to emerge from the earth's shadow to the end of the eclipse.

EMERSON, RALPH WALDO, an American author, born in Boston, Mass., in 1803, died in Concord in 1882. In 1826 he was approbated to preach, and in 1829 was ordained as colleague of Rev. Henry Ware, Jr., in the pastorate of the 2nd church, Boston, and succeeded Ware within eighteen months. He resigned his pastorate in 1832, and went to Europe the following year for his health. While on this journey he met several eminent writers, and formed with Thomas Carlyle one of the most interesting friendships in literary annals. He returned to the United States in 1834, and for the succeeding three years lectured in Boston. In 1835 he moved into a house on the old Lexington road, along which the British had retreated from Concord sixty years before; and this house he made his home for the remainder of his life. For several years he had been writing poetry, but he published little until after he settled on the Lexington road, when his career became distinctively that of a literary man.

For a time he edited "The Dial," a literary journal published from 1840 to 1844, and through its columns gave to the public more than forty of his own pieces, both prose and verse. From 1847 to 1849 he traveled in Europe, and delivered many lectures on topics of the day. During the civil war he took sides with the North, and delivered several forcible lectures favoring abolition. Besides contributing to numerous periodicals he published *Nature* (1836); a volume of essays (1841); another volume (1844); volume of poems (1846); *Representative Men* (1850); *English Traits* (1856); *Conduct of Life*, a volume of essays (1860); volume of essays, entitled *Society and Solitude* (1870); and *Letters and Social Aims* (1875).

EMINENCE, a title given to cardinals by Urban VIII. Up to the period of his pontificate they had been called Most Illustrious, and Most Reverend.

EMINENCE, a town in Henry county, Ky., 28 miles west of Frankfort, in a fine blue-grass region, where farming and stock-raising are carried on. There is a valuable mineral spring here, two colleges, and also woolen and flour mills. Pop., 1,002.

EMINENT DOMAIN denotes the universal right in the public over property, by virtue of which the supreme authority in a state may compel a proprietor to part with what is his own for the public use.

EMIN PASHA, whose real name is Eduard Schnitzler, was born in 1840 at Oppeln, Silesia, educated at Neisse, and studied medicine at Breslau and Berlin. In 1864 he went to Turkey, where he quickly established a reputation as a physician. He accompanied Hakki Pasha on his official jour-

neys through Armenia, Syria, and Arabia. He went with Ismail, governor of Scutari, in his exile to Trebizond. He knew the Turkish and Arabic languages well, and had so completely adopted the habits and customs of the people that he readily passed for one of them. He adopted the name Emin, "the Faithful One," and, upon the death of Ismail (who had been restored to royal favor) he married his widow. In 1876 he joined the Egyptian service and was ordered to Khartum, and thence as chief medical officer to the Equatorial Province, of which in 1878 he was appointed governor by General Gordon. Here he was isolated and shut off from the world, and harassed by the troops of the Mahdi and by revolts instigated in the interest of the slave-trade. In 1886 news was received in England that he was still holding his post in Central Africa, and an expedition under Stanley was sent to his relief. The expedition reached Emin in May, 1888. In August, while the expedition was looking for its rear-guard, he was imprisoned by the natives, but escaped in December, and in February, 1889, rejoined Stanley, with whom he reached Zanzibar in December. The patron's medal of the Royal Geographical Society was awarded to him in 1890; in which year, also, he entered the German service and is now again in Africa.

EMMA, Queen Regent of the Netherlands (Ade-laïde Emma Wilhelmina Thérèse), was born Aug. 2, 1858, at Arolsen, the capital of Waldeck. She was married on Jan. 7, 1879, to the late William III. of Holland, by whom she has one daughter. She accepted the Regency a few days before her husband's death, when she issued a proclamation declaring her sense of the responsibility which had devolved upon her. She is one of the most popular regents in Europe.

EMMETTSBURG, a railroad junction and county-seat of Palo Alto county, Iowa, on the Des Moines River, 55 miles northwest of Fort Dodge. Flour and lumber are produced here. Population, 1,584.

EMMITTSBURG, a village of Frederick county, Md., one mile from Mason and Dixon's line. It was laid out by William Emmitt in 1773, and contains Mount St. Mary's College (Catholic), St. Joseph's Academy, and the mother-house of the Sisters of Charity in the United States. Its educational buildings are among the largest in Maryland. Population (1890), 844.

EMMONS, NATHANIEL (1745-1840), an American theologian, licensed to preach in 1769. From 1773 to 1827 he was pastor at Franklin, Mass., and during this long pastorate prepared fifty-seven young men for the ministry. He was a founder and the first president of the Massachusetts missionary society. He published many essays, sermons, and dissertations.

EMOLLIENTS (from Lat. *mollis*, soft), substances used to soften the textures to which they are applied, as poaltices, fermentations, etc., externally, and demulcents internally.

EMORY, a village of Washington county, Va., 10 miles east of Abingdon. It is the seat of Emory and Henry College.

EMORY, JOHN (1789-1835), an American M. E. bishop. In 1805 he began the practice of law, but in 1810 entered the Methodist Episcopal ministry. He was a delegate to the general conferences, with one exception, from 1816 to 1832. In 1820 he was sent to the British Wesleyan conference, and in 1832 was ordained a bishop. For a long time he managed the affairs of the Book Concern, and edited the "New York Christian Advocate." He founded the "Methodist Quarterly Review," and was active in the establishment of the University of New York, Wesleyan University and Dickinson

College. Among his works are *The Divinity of Christ Vindicated, and Defense of Our Fathers*.

EMORY COLLEGE. See COLLEGES, in these Revisions and Additions.

EMPANEL, to write in a schedule or roll the names of such jurors as the sheriff returns to pass upon any trial.

EMPECINADO, DON JUAN MARTIN DIAZ, EL (1775-1825), one of the leaders of the Spanish revolution of 1820. He entered the Spanish army in 1792. At the head of about 6,000 men he carried on a guerrilla warfare against the French during the Peninsular struggle, and acquired great distinction. In 1814 he was appointed colonel in the regular army, and the king himself created him field-marshal; but in consequence of petitioning Ferdinand, in 1815, to reinstitute the Cortes he was imprisoned and afterwards banished to Valladolid. On the outbreak of the insurrection in 1820 he took a prominent part on the side of the Constitutionalists, and on several occasions exhibited great courage and circumspection. After the triumph of the Absolutists in 1825, he was arrested and finally executed.

EMPEROR MOTH, a moth of the same family (*Bombycidae*) with the silk-worm moth, and of a genus to which the largest of lepidopterous insects belong. Its expanse of wings is about three and a half inches. Each wing is ornamented with a large, eye-like, glassy and transparent spot, and such spots are exhibited by many of the genus.

EMPIRE CITY, the county-seat of Coos county, Oregon, on Coos bay, 130 miles southwest of Salem. It exports excellent lignitic coal.

EMPIRIC, originally meaning an experimentalist or searcher after facts in Nature, came to be synonymous with vulgar ignorance. The empirics were a regular sect of ancient physicians in the time of Celsus and Galen, who give us some insight into their modes of thought and practice. They laid great stress on the unprejudiced observation of Nature, and thought that, by a careful collection of observed facts forming a history, the coincidence of many observations would lead to unalterable prescriptions for certain cases. By an empiric in medicine is now understood a man who, for want of theoretic knowledge, prescribes remedies by guess according to the name of the disease or to individual symptoms, without thinking of the constitution of the patient or other modifying circumstances.

EMPIRICAL FORMULA: in chemistry, a mode of expressing the results by elementary symbols. There are numerous compound substances, such as acetic acid, lactic acid, glucose, etc., which would all give the same result on analysis, and would be represented by the empirical formula CH_2O , or one equivalent of carbon, two equivalents of hydrogen, and one equivalent of oxygen. The very different properties of these bodies, all composed of the same elements, must be due to a different order of combination, which, to a great extent, may be represented by *rational* formula as distinguished from empirical. Acetic acid is the hydrated oxide of acetyl, or may be regarded as a molecule of water (H_2O), in which half the hydrogen is replaced by acetyl, $\text{C}_2\text{H}_3\text{O}$; and this expressed by the *rational* formula $\text{C}_2\text{H}_3\text{O} \cdot \text{O}$, but could not be implied by the empirical mode, either in the form of CH_2O , or $\text{C}_2\text{H}_4\text{O}_2$.

EMPIRICAL LAWS are such as express relationships, which may be merely accidental, observed to subsist among phenomena, or cause of the production of phenomena. They are usually tentative, and form stages in the progress of discovery of causal laws.

EMPIRICISM, the dependence for knowledge or skill on experience or experiment rather than on theory. Professor Ward, in *Dynamic Sociology*, defines empiricism as the application of superficial truths, recognized in a loose, unsystematic way, to immediate and special needs. In medicine the term is used of the dependence upon mere experience in the trial of remedies, without knowledge of the medical sciences or of the clinical observations and opinions of others. In metaphysics the theory which attributes the origin of all our ideas to sensuous experience, denying the existence of innate or *à priori* conceptions, is called empiricism. Mr. Lewes, in *Problems of Life and Mind*, says that this term, although commonly employed by metaphysicians with contempt, may be accepted, since even the flavor of contempt only serves to emphasize the distinction.

EMPORIA, a flourishing city and county-seat of Lyon county, Kan., situated in a fine agricultural region. It has a State normal school, the College of Emporia, a business college, conservatory of music, gas and electric lights, opera houses, water works, and produces various manufactures, among which are canned goods. Pop. (1890), 7,551.

EMPORIUM, a railroad junction and county-seat of Cameron county, Pa., situated 99 miles northwest of Williamsport. It has a good lumber trade, and valuable salt wells are found in the vicinity.

EMPORIUM: in Homer's time, a person who sailed in a ship belonging to another, but later a wholesale merchant as opposed to a retailer. An emporium thus came to be applied to the receptacle in which wholesale merchants stowed their goods in seaports and elsewhere, and thus corresponded to our warehouses.

EMPSON, SIR RICHARD, the unpopular agent of Henry VII. In 1491 he became Speaker of the House of Commons, and in 1504, now a knight, high steward of Cambridge University, and chancellor of the duchy of Lancaster. Throughout Henry's reign he was employed in exacting taxes and penalties due to the crown. His conduct was by the people regarded as infamous, and in the second year of Henry VIII's reign he was convicted of treason, attainted, and beheaded on Tower Hill, Aug. 17, 1510.

EMPYREAN, a word used by the old metaphysical natural philosophers to designate the highest region of light, where the purest and most rarefied elements of fire existed; and by mediæval and modern poets to indicate heaven, the source of light and the home of the blessed.

EMPYREUMA, the burned smell and acrid taste which result when vegetable or animal substances are decomposed by a strong heat. The cause of the smell and taste resides in an oil called *empyreumatic*, which does not exist naturally in the substance, but is formed by its decomposition.

EMS, a river in the northwestern part of Germany. It rises in Westphalia, at the southern base of the Teutoburger Wald, and flowing first in a northwestern, and then, through the Hanoverian territories, in a northern direction, empties itself into Dollart bay. In 1818 it was connected by a canal with the Lippe, and thus with the Rhine.

EMULSION, the term applied to those preparations in pharmacy where the product is a milky white opaque mixture, composed more or less of oily particles floating in mechanical suspension in mucilaginous liquid.

ENAREA, a country of Africa south of Abyssinia, situated within lat. 7°-9° N., and long. 36°-38° E., but its limits have not yet been definitely ascertained. It is inhabited by a portion of the Gallas tribes, who, owing to the continued commu-

nication which they keep up with Abyssinia, and also to the residence of many Mohammedan merchants among them, are much more civilized than the Gallas usually are. Their government is an hereditary and absolute monarchy. The principal rivers of Enarea are the Gibbe and the Dodesa. Its coffee plantations are extensive. It is remarkable for its manufactures of ornamented arms, and of cloths with embroidered borders. Besides these it exports slaves, gold, ivory, civet, and skins into Abyssinia. The king and a small portion of the population are Mohammedans, and it is said that native Christians have been found in Enarea. The capital is Saka, near the river Gibbe.

ENARTHROSIS, the term used by anatomical writers to express the kind of joint which admits of the most extensive range of motion. It occurs in the hip and shoulder joints, and is commonly called the ball-and-socket joint.

ENCALADA, MANUEL BLANCO, born in Buenos Ayres in 1790, died at Santiago, Sept. 5, 1876. He studied at Madrid and in the naval academy at Leon, deserted the Spanish ranks and joined the Chilean party. In 1819 he became rear-admiral, and in 1820 major-general of infantry, and in 1825 he was appointed head of the Army of Chili. He was for two months president of the Republic in 1826, governor of Valparaiso from 1847 to 1852, and minister to France from 1853 to 1858.

ENCAMPMENT (Lat. *campus*, a plain), a lodging or home for soldiers in the field. There are now four different kinds of these lodgments in use: namely, *intrenched* camps, where an army is intended to be kept some time, protected against the enemy; *flying* camps, for brief occupation; camps of *position*, bearing relation to the strategy of the commander; and camps of *instruction*, to habituate the troops to the duties and fatigues of war.

ENCEINTE, in fortification, denotes generally the whole area of a fortified place. Properly, however, it means a cincture or girdle, and in this sense the *enceinte* signifies the principal wall or rampart encircling the place.

ENCEPHALOCLELE, the term applied to a tumor projecting through the skull in one of the parts where the bones are incomplete in infancy, and consisting of a protrusion of the membranes of the brain, containing a portion of the brain itself. The most common situation of such tumors is in the middle line and at the back of the head.

ENCORE ("again"), a French expression, generally used in England by the audience of a theater or concert-room, when requesting the repetition of the performance of a piece of music. It is not used by the French themselves, who, in similar circumstances, exclaim *bis* (twice).

ENCRINAL, or **ENCRINITAL LIMESTONE**, a name given to some carboniferous limestones from the great abundance in them of the calcareous skeletons of encrinites.

ENCRINITES, fossil crinoids, often known as stone-lilies.

ENCYCLICAL, a letter addressed by the Pope to all his bishops, condemning current errors, or advising the Christian people how to act in regard to great public questions. It differs from a bull in that the latter is usually more special in its destination.

END, a familiar word concerned in some important discussions, and especially in ethics. It is generally used in the sense of the thing aimed at, the object, purpose, or goal of human action; but not infrequently to mean the close, or death.

ENDEMIC, a term applied to diseases which affect numbers of persons simultaneously, but so as to show a connection with localities as well as with

their inhabitants. Endemic diseases are usually spoken of as contrasted with epidemic and sporadic; the first term indicating that a disease infects habitually the population within certain geographical limits, and also that it is incapable of being transferred or communicated beyond those limits; while, on the other hand, a disease is termed epidemic if it is transmitted without reference to locality; and sporadic if it occurs in isolated instances only. The most marked type of an endemic disease is ague, which has the habits mentioned above, and is to so marked a degree a denizen of particular tracts of country as to lead to their being in some instances almost depopulated.

ENDICOTT, JOHN (1588-1665), a colonial governor of Massachusetts. In 1628 he took charge of the plantation at Naumkeag, now Salem, and continued to exercise the chief authority until the arrival of John Winthrop, who took charge in 1630. In 1641-44 he was deputy-governor of Massachusetts, again in 1650 and in 1654, and was governor in 1644, 1649, 1650-53, and in 1655-65. In 1645 he became sergeant major-general of the colony, and in 1685 president of the colonial commissioners.

ENDICOTT, WILLIAM CRONINSHIELD, an American statesman, was born at Salem, Massachusetts, in 1827. He graduated at Harvard University 1847. He then studied law for three years and was admitted to the bar in 1850. He continued the practice of the law until 1873, when he was raised to the bench of the Massachusetts Supreme Court, which position he resigned in 1882. In 1884 he was the Democratic candidate for Governorship of Massachusetts, but was not elected. He was appointed Secretary of War by President Cleveland, in March, 1885.

ENDOMORPH, the name given to a mineral which is inclosed within another mineral, the latter being termed a *perimorph*.

ENDORSE: in heraldry, an ordinary containing the fourth part of a pale. *Endorsed*, again, or *indorsed*, signifies that objects are placed on the shield back to back.

ENDOSMOSE and **EXOSMOSE**, terms applied to the transfusion that takes place when two liquids or two gases of different densities are separated by an animal or a vegetable membrane. This action performs a very important part in living organisms, and explains many phenomena of the circulation of sap and the processes of nutrition, which were previously referred only to the wonderful action of vital energy. The term *osmose*, or *osmotic action*, is now preferred.

ENEMA, a medicine or fluid substance, conveyed into the body by injection, usually through the rectum or lower bowel.

ENERGICO, an Italian term in music, meaning with energy and force; with strong articulation and accentuation, and a marked powerful delivery of the single notes, without losing in distinctness of execution.

ENFIELD, a village of Grafton county, N. H., 42 miles northwest of Concord. The place is a summer resort and a portion of the inhabitants are members of the United Society of Shakers; they manufacture pails, tubs, and brooms, and raise garden-seeds. There are also manufactories of furniture, leather, knit-goods, and carriages.

ENFIELD, a village of Halifax county, N. C., 144 miles from Wilmington. It exports large quantities of cotton, lumber, staves, peaches, wine, shingles, and brick. There is a gold mine in the vicinity.

ENFRANCHISE, **ENFRANCHISEMENT**, to make free; the admission to certain liberties or privileges. Thus, a person made a denizen of the

country, or receiving the freedom of a city or burgh, is said to be enfranchised.

ENGELBERG, a village of Switzerland in the canton of Unterwalden, at the foot of Mount Titlis. It has a famous school library, valuable paintings, and an extensive cheese-cellar.

ENGELHARDT, JOHANN GEORG VEIT, a learned German theologian, born at Neustadt, on the Alsch, Nov. 12, 1791, died Sept. 13, 1853. He studied at Erlangen, where in 1820 he was appointed extraordinary professor, and in 1822 ordinary professor in theology. In the course of his life he wrote many learned dissertations in the *Journal of Historical Theology*.

ENGELMANN, GEORGE (1809-84), an American botanist. He studied in Germany and in France, and in 1832 emigrated to the United States. He settled in St. Louis, and soon became prominent as a physician. In 1836 he started "Das Westland," a German newspaper, which gained high reputation in the United States and in Europe. About this time he became distinguished as a botanist, and contributed many articles to the American Academy of Arts and Sciences, and to the Government reports. He was a member of several scientific societies.

ENGLEWOOD, a railroad junction of Cook county, Ill., 7 miles south of Chicago. It contains a school for the training of school teachers.

ENGLEWOOD, a village in Bergen county, N. J., 14 miles north of New York city, and near the palisades of the Hudson River.

ENGLISH, THOMAS DUNN, a lawyer, born in Philadelphia, Pa., June 29, 1819. He was educated at the University of Pennsylvania, graduating with the degree of M. D. in 1839. He entered the profession of law in Philadelphia in 1842, and received the degree of LL.D. from William and Mary College in 1876. In politics he is a Democrat. He was elected member of the New Jersey State legislature in 1863 and 1864. In 1890 he was elected a Representative from the Sixth Congressional district of New Jersey to the 52d Congress, and was returned to the 53d Congress by the same constituency.

ENGLISH, JAMES EDWARD, born in New Haven, Conn., March 13, 1812, sat in the State legislature 1855-58. He was elected to Congress as a war Democrat in 1861 and served four years. From 1867 to 1870 he was governor of Connecticut and in 1875-76 served as United States senator. He was afterward chairman of the national Democratic committee, and died March 2, 1890.

ENGLISH, WILLIAM HAYDEN, born at Lexington, Ind., August 27, 1822; was elected to Congress as a Democrat in 1852 and served from 1853 to 1861. In 1880 he was the Democratic candidate for the vice-presidency on the ticket with General Hancock, and suffered defeat with him.

ENGRAILED: in heraldry, a line composed of a series of little semi-circular indents, with the points turned outwards and upwards.

ENGROSSING A DEED, writing it out in full and regular form on parchment or paper for signature.

ENGUICHÉ, a hunting horn, the rim around the mouth of which, being of different color from the horn itself, is said in heraldry to be enguiché, of the color in question.

ENNEMOSER, JOSEPH, a medico-philosophic writer, born at Hintersee, in the Tyrol, Nov. 15, 1787, died in 1854. He commenced his academic studies at Innsbruck in 1806. On the rising of the Tyrolese against the French in 1809 Ennemoser honorably distinguished himself in battle on several occasions. In 1816 he took the degree of

Doctor of Medicine, and in 1819 was made professor of medicine at the new University of Bonn. In 1841 he went to Munich, where he obtained a great reputation by the application of magnetism as a curative power.

ENOCHS, WILLIAM H., a lawyer, born in Noble county, Ohio, March 29, 1842. He received a common-school education; entered the Union army as a private at the outbreak of the war of the Rebellion, and was mustered out a brigadier-general. He was three times severely wounded. He studied law and entered the profession in 1867 at Ironton. In politics he is a Republican, and has served as prosecuting attorney of Lawrence county, and as a member of the Ohio State legislature. In 1890 and 1892 he was elected a Representative from the Twelfth District of Ohio.

ENSEMBLE (Fr.) the general effect produced by the whole figures or objects in a picture, the persons and plot of a drama, or the various parts of a musical performance.

ENSILAGE. See SILO, *Britannica*, Vol. XXII, p. 67.

ENTADA, a genus of leguminous climbing shrubs (sub-order *Mimoseæ*) having pinnate or bipinnate leaves, and being remarkable for their great pods, in which the egg-sized seeds lie amid a gelatinous substance. These pods are sometimes fully five feet long, and six inches broad.

ENTELLUS MONKEY, or LONUMAN (*Semopithecus entellus*), an East Indian species of monkey, with yellowish fur, face of violet tinge, surrounded with projecting hairs, long limbs, and very long muscular and powerful—though not prehensile—tail. It is held in superstitious reverence by the Hindoos.

ENTENTE CORDIALE, a term which originated, according to Littré, in the French chamber of deputies in 1840-41, and which has been used especially to denote the friendly relations and disposition existing between France and Great Britain.

ENTERITIS, inflammation of the bowels, and especially of their muscular and serous coat, leading to constipation and pain, with colic, and sometimes ileus. Enteritis is distinguished from these last affections, indeed, only by the presence of inflammatory symptoms—that is, pain, tenderness, fever, etc., from a very early stage of the disease, and in so decided a form as to require special attention. The disease is one of great danger, and should never be incautiously treated with domestic remedies. It is closely allied to peritonitis, and often depends upon internal mechanical causes, or on external injury.

ENTEROPNEUSTA, a class of worm-like animals, including Balanoglossus and Cephalodiscus. It is of great zoological importance, because of the characters in which the members resemble vertebrates.

ENTERPRISE, a winter resort, and county-seat of Volusia county, Fla., situated at the head of steamboat navigation on St. John's River, 80 miles south of St. Augustine. "Green Spring," a noted sulphur spring, 80 feet in diameter and 100 feet deep, is located here.

ENTOMOSTRACA, a general name for the lower orders of Crustacea, including Phyllopoda, Ostracoda, Copepoda, and Cirripedes.

ENTOPHYTES, a term employed to denote those parasitic plants which grow on living animals.

ENTR'ACTE: in music, an instrumental piece, composed in the form of a little symphony or overture, to be performed between the acts of a play.

ENTRÉ DOURO e MINHO, a province in the extreme northwest of Portugal, consisting of three

districts—Braga, Vianne, and Porto, with the town of Braga for the capital.

ENTRE RIOS (*Sp.*, between rivers), an Argentine State, which takes its name from its occupying the space between the Parana and the Uruguay, immediately above the point where they unite to form the Rio de la Plata. The area is estimated at 32,000 square miles. Population, about 160,000. The capital is Entre Rios, with a population of 16,000.

ENTRESOL, a low story between two main stories of a building, generally above the first story. *Mezzanine* is another name for the entresol.

ENTROPIUM, or ENTROPION, inversion of the eyelashes, or even eyelid, consequent either on loss of substance, or on inflammatory swelling of the lid.

ENTRY: in law, taking possession of lands or tenements by entering or setting foot upon them; also, the entering into a building unlawfully, as in housebreaking or burglary.

ENTRY, RIGHT OF. A person is said in law to have a right of entry who has been wrongfully dispossessed or ousted of land and tenements by abatement, intrusion, or disseizin. See the several articles under these heads.

EPACRIDACEÆ, a natural order of exogenous plants, consisting of shrubs and small trees, which, both in appearance and in botanical character, much resemble the *Ericaceæ*, or heath family. The most important distinguishing structural character is found in the simplicity of the anthers, which are one-celled, open longitudinally, and are destitute of appendages. The flowers of the *Epacridaceæ* have generally a tubular corolla dividing into five segments, which sometimes become separate petals. The calyx is persistent, often colored, has the same number of segments with the corolla, and is surrounded with small bracts. The stamens are fewer than in the *Ericaceæ*, usually equal in number to the segments of the corolla, and alternate with them. The fruit is sometimes a capsule, sometimes a berry, sometimes a drupe. The leaves are simple, generally alternate, often crowded; the flowers in spikes, in terminal racemes, or axillary and solitary. About 400 species of the *Epacridaceæ* are known, all natives of the Indian archipelago, the South Sea Islands, and Australia.

EPAULETTE, a shoulder-knot worn by commissioned officers in the naval profession, both as an ornament and a distinction.

EPEIRA, a genus of spiders, the type of a family called *Epeiridæ*. They are of those spiders which have only a pair of pulmonary sacs and spiracles; construct webs with regular meshes, formed by concentric circles and straight radii; and are furnished with a pair of almost contiguous eyes on each side, other four eyes forming a quadrangle in the center.

EPES, JAMES F., a lawyer, born in Nottoway county, Va., May 23, 1842. He was educated in the common schools and at the University of Virginia; was a cavalryman in the Confederate army during the war of the Rebellion; studied law in the Washington and Lee University, and entered the profession of law in 1867. In politics he is a Democrat, and was attorney for the Commonwealth from 1870 to 1882. In 1890 he was elected a Representative from the Fourth Congressional District of Virginia to the 52d Congress. In 1892, Mr. Epes again became a candidate, and being re-elected from the same district took his seat in the 53d Congress.

EPHEMERES, a name applied to almanacs from their containing notices of each day. It is mostly confined to astronomical tables giving the daily

places of the sun, moon, and planets, and other phenomena of the heavens.

EPHOD, a vestment worn by the Jewish high-priest. It consisted of two shoulder-pieces, one covering the back, the other the breast and upper part of the body. Two onyx stones set in gold fastened it on the shoulders, and on each of the stones were engraved the names of six tribes, according to their order. A girdle or band, of one piece with the ephod, fastened it around the body. Just above this girdle, in the middle of the ephod, and joined to it by little gold chains, rings, and strings, rested the square oracular breastplate with the mysterious *Urim* and *Thummim*.

EPI, or GIROUETTE, a species of light, ornamental finial of ironwork or terra-cotta with which pointed roofs or the tops of spires are sometimes surmounted.

EPIDEMIC, a disease which attacks numbers of persons in one place, simultaneously or in succession, and which in addition is observed to travel from place to place, often in the direction of the most frequented line of communication.

EPICYCLOID, the name of a peculiar curve. When a circle moves upon a straight line, any point in its circumference describes a cycloid; but if the circle moves on the convex circumference of another circle, every point in the plane of the first circle describes an epicycloid, and if on the concave circumference a hypocycloid. The circle that moves is the generating circle; the other, the base.

EPIGASTRIUM, the part of the abdomen which chiefly corresponds to the situation of the stomach, extending from the sternum towards the navel or umbilicus, and bounded on each side by the hypochondria. It is called, in popular language, the pit of the stomach.

EPIGENE, a term applied to those geological agents of change which affect chiefly the superficial portions of the earth's crust, as the atmosphere, water, plants, and animals.

EPIGLOTTIS, a cartilaginous valve, which partly closes the aperture of the larynx.

EPILOBIUM, a genus of plants of the natural order *Onagraceæ*, having four deciduous calycine segments; four petals; a much elongated, four-sided, four-celled, four-valved, many-seeded capsule; and seeds tufted with hairs at one end. The species are herbaceous perennials, natives of temperate and cold countries, and very widely diffused both in the Northern and in the Southern hemispheres.

EPISCOPAL CHURCH, PROTESTANT. See Britannica, Vol. VIII, p. 943. See also RELIGIOUS DENOMINATIONS, in these Revisions and Additions.

EPISTLE. The lesson in the church service called the Epistle derives its name from being most frequently taken from the Apostolic Epistles, although it is sometimes also taken from other parts of Scripture.

EPISTLE SIDE OF THE ALTAR, the left side of the altar or communion table, looking from it, at which in the church service the epistle of the day is read. It is of lesser distinction than the right or Gospel side, and is occupied by the clergyman of lower ecclesiastical rank.

EPISTOLÆ OBSCURORUM VIRORUM, the title of a collection of satirical letters which appeared at the commencement of the 16th century, and professed to be the composition of certain ecclesiastics and professors in Cologne and other places in Rhenish Germany. They were directed against the scholastics and monks, and lashed with merciless severity their doctrines, writings, morals, modes of speech, manner of life, follies and extravagances, and thus helped in no small degree to bring about the Reformation.

EPIZOA, animals that live on the bodies of other organism in various degrees of parasitism.

EPIZOOTIC, or **EPIZOOTY**, any disease temporarily prevalent among the lower animals; especially the influenza when thus prevalent among horses or other domestic animals. Many of the epidemics of influenza, nearly one hundred of which have occurred since the beginning of the 16th century, have been accompanied by similar disorders among horses, cows and dogs. About 16,000 horses were attacked by it in New York during the prevalence of the pestilence in 1872. See *Britannica*, Vol. XIII, p. 73.

EPODE, the last part of the chorus of the ancient Greeks, which they sung after the strophe and antistrophe, when the singers had returned to their original place. The epode had its peculiar measure of syllables and number of verses.

EPONYM, a mythical personage created to account for the name of a tribe or people.

EPROUVETTE, a machine for testing the strength of gunpowder. The ordinary eprouvette is an instrument shaped like a small pistol without a barrel, and having its breach chamber closed by a flat plate connected with a strong spring. On the explosion of the powder against the plate, it is drawn back to a distance indexed according to the strength of the powder, and is retained at its extreme state of propulsion by a ratchet-wheel.

EPWORTH, a town in the northwest of Lincolnshire, England, 30 miles north-northwest of Lincoln, distinguished as the birthplace of John Wesley, the founder of Methodism, as also of Kilham, founder of the Methodist New Connection. Population, about 2,300.

these societies into one new organization, to be called the Epworth League, whose object is "to promote an earnest, intelligent, practical, and loyal spiritual life in the young people of the church, to aid them in constant growth in grace and in the attainment of purity of heart." The success attending the organization has been extraordinary. In less than two years 5,000 local chapters have been enrolled, with a total membership of about 300,000. The general organization includes District, Annual Conference, and General Conference District Leagues. The management rests with a board of control, five of whom are chosen by the bishops, five by the managers of the Tract Society, five by the managers of the Sunday-school Union, and two are elected by each General Conference district. The plan of local organization is clearly represented by the accompanying diagram, known as the Epworth wheel.

In this wheel is shown the president surrounded by his cabinet, each member of which is the chairman or head of a department. Each cabinet officer has associated with him in the conduct of his department a committee of three or five, nominated by himself and confirmed by the League. The president must be a member of the M. E. church, and the remaining officers are to be of good moral character, but all must be approved by the Quarterly Conference. A pledge is provided, but its adoption by local chapters is made altogether voluntary. The general headquarters of the League are at 150 Fifth Avenue, New York.

EQUABLE MOTION, that by which equal spaces are passed over in equal time.

EQUATOR, **TERRESTRIAL**, the great circle on the earth's surface dividing the earth into the Northern and Southern hemispheres, and being half way between the poles.

EQUERRY: in the household of British sovereigns, an official in the department of the Master of the Horse, whose duty it is to accompany the sovereign when riding in state. The royal princes have also equerries.

EQUESTRIAN ORDER, or **EQUITES**, a body which originally formed the cavalry of the Roman army, and is said to have been instituted by Romulus, who selected from the three principal Roman tribes 300 equites.

EQUESTRIAN STATUE, the representation of a man on horseback. Equestrian statues were awarded as a high honor to military commanders and persons of distinction in Rome, and latterly were chiefly restricted to the emperors, the most famous in existence; the only ancient equestrian statue in bronze being that of the Emperor Marcus Aurelius, which now stands in the piazza of the capital at Rome.

EQUIANGULAR, having equal angles. A figure is said to be equiangular whose angles are all equal to one another, as a square or any regular polygon. Also triangles and other figures are said to be equiangular one with another whose corresponding angles are equal.

EQUILATERAL, having equal sides. A square is equilateral. The equilateral hyperbola is that whose axes and conjugate diameters are equal.

EQUINOCTIAL, the same as the celestial Equator. The equinoctial and the ecliptic intersect. Equinoctial time is time reckoned from the moment in each year when the sun passes the vernal equinox. This instant is selected as a convenient starting-point of a uniform reckoning of time for the purposes of astronomical observers.

EQUINOCTIAL GALE, or **STORM**, a gale or storm that happens at or near the time of the equinox, in any part of the world. It is a wide-

EPWORTH LEAGUE, a young people's society connected with the Methodist Episcopal church. In April, 1891, it was the strongest denominational young people's society in existence, and its growth had been phenomenal. In May, 1889, a conference of all the general young people's societies of the M. E. church assembled in Cleveland, Ohio. Accredited delegates were present from the Young People's Methodist Alliance, the Oxford League, the Young People's Christian League, the Young People's Methodist Union, and the Young People's Methodist Alliance of the North Ohio Conference. The result of this meeting was the merging of

spread belief that gales and storms are more frequent about the time of the spring and autumn equinoxes, but this belief is unsupported by the records of careful observations.

EQUIPMENT, EQUIPAGE: in military matters, names given to certain of the necessities for officers and soldiers.

ERASED and ERADICATED, in heraldry, signifies that an object is plucked or torn off, and showing a ragged edge.

ERASURE, or RAZURE, the scraping or shaving of a deed or other formal writing.

ERCKMANN-CHATRIAN, the compound name of two French romancists, whose stories of Alsatian peasant life are known the whole world over. Émile Erckmann was born May 20, 1822, and Alexandre Chatrian Dec. 2, 1826. Their literary partnership dates from 1848. Chatrian died in 1890.

ERDMAN, AXEL JOACHIM, a Swedish geologist, born Aug. 12, 1814, died Dec. 1, 1869. He published *Lärobok, Mineralogien* (1853), *Vägledning till bergarternas Kännedom* (1855), and *Bidrag till Kännedom om Sveriges quartära bildningar* (1868).

ERDMANN, JOHANN EDUARD, a German philosopher, born at Wolmar in Livonia, Russia, in 1805, died in 1887. He studied at Dorpat and Berlin, and became professor of philosophy at Halle in 1839. He wrote several works on philosophy, psychology, logic and metaphysics.

EREBUS, MOUNT, an active volcano on Victoria Land, in 78° 10' south latitude, rising 12,367 feet above the sea. It was discovered in 1841 by Ross, in command of the *Erebus* and *Terror*, who named it after one of his vessels.

ERGASTERIA, a mining town in the Greek monarchy of Attica and Bœotia, near Cape Colonna, with ancient lead and silver works, reopened in 1864. Population, 6,500.

ERICACEÆ, or HEATHS, a large, widely distributed order of corallifloral dicotyledons, chiefly small shrubs, frequently evergreen and social in growth, covering large areas, especially in mountainous regions and on tablelands.

ERICSSON, JOHN (1803-89), a Swedish-American engineer. At the age of 12 he became a leveller at the grand Swedish ship canal, and two years later was engaged in setting out the work of a section employing 600 soldier operatives. In 1820 he became an officer of engineers in the Swedish army, and soon after received the appointment on the survey of Northern Sweden. In 1827 he resigned from the army, and spent the remainder of his life in experimenting and inventing. In 1839 he came to the United States. He made numerous valuable inventions in machinery; but he is best known to the public world as the designer and builder of the partially submerged war vessel, the *Monitor*, which defeated the Confederate iron-clad *Merrimac*, March 9, 1862. This victory undoubtedly turned the tide of naval warfare in favor of the North, and at once gained for the inventor of the novel and ingenious battleship, a worldwide reputation as a naval engineer. In 1883 he erected in New York a "sun motor," having made many early experiments for developing power direct from the sun. Captain Ericsson died in New York city on March 5, 1889, and in compliance with his expressed wish his remains were carried to Sweden.

ERICSSON, NILS, a Swedish engineer, brother of John Ericsson, was born Jan. 31, 1802, died at Stockholm, Sept. 8, 1870. In 1832 he became major in the engineering corps of the Swedish army; was afterwards head of the mechanical corps in the navy; and from 1855 to 1863 had charge of the construction of Swedish railroads. He was also engineer of the Saima canal in Finland, and of

the locks near Stockholm and at Trollhättan. In recognition of his services he was knighted in 1854, and in 1860 was made a baron.

ERIE, a city and county-seat of Neosho county, Kansas.

ERIE, a city of Pennsylvania, and county-seat of Erie county (see *Britannica*, Vol. VIII, p. 522). The city has an area of six square miles, with 150 miles of streets, wide, well paved and lighted. Many of the streets are paved with Medina stone and asphalt, and lined with elegant mansions, surrounded by beautiful gardens and shrubbery. On State street are handsome fountains, and a soldiers' monument, costing \$10,000. An elaborate system of water works supplies the city with an abundance of pure water. The stand-pipe at the pumps is 251 feet high, said to be the highest water pipe in the world. The Government building, completed in 1889, is a notable structure, 114x72 feet, built of stone and granite. The city hall is 64x124 feet, 88 feet in height, and cost \$300,000. The court-house is 61x132 feet, and cost \$60,000. The addition is now (1891) being constructed, at a cost of \$50,000. Charitable institutions are: Soldiers' and Sailors' Home, Home for the Friendless, Hamot Hospital, and St. Vincent's Hospital. An excellent system of public schools is maintained. The Central High School building is 270x120 feet, seats 1,500 pupils, and cost \$100,000. Other educational institutions are: Clark's Business College, the Erie Academy, the Erie Art School, and St. Benedictine (Roman Catholic) Academy. Erie is an important manufacturing center, and the market for a rich farming country. Population in 1880, 27,757; in 1890, 39,699.

ERIE, CANAL. See **CLINTON, DEWITT**, *Britannica*, Vol. VI, p. 7.

ERIE, LAKE. See *Britannica*, Vol. XIV, pp. 216-22; Vol. XVII, p. 451; Vol. XXI, pp. 179, 182.

ERIES. See **INDIANS, AMERICAN**, in these Revisions and Additions.

ERIGERON, a genus of plants of the natural order *Compositæ*, sub-order *Corymbifere*, having heads (flowers) of many florets, the florets of the ray numerous, in several rows, of a different color, from those of the disc. *Erigeron Philadelphicus*, a native of North America, with pale purple ray, and a fetid smell, is valued in the United States as a diuretic.

ERIOCAULACEÆ, a natural order of endogenous plants, nearly allied to *Restiaceæ*, and containing about 200 known species, many of which are aquatic or marsh plants. The *Eriocaulaceæ* are chiefly natives of the tropical parts of America and Australia.

ERIODENDRON, a genus of trees of the natural order *Sterculiaceæ*, natives of tropical countries. Their thick woody capsules contain a kind of wool surrounding the seeds. They are sometimes called Wool-Trees, or silk-cotton trees.

ERITH, a town of Kent, on the banks of the Thames, 15½ miles by rail east of Charing Cross. It is a summer resort for Londoners, and the headquarters of several yacht clubs. It has a much restored church, rich in brasses. At Erith the *Grace de Dieu* was built in 1515. Population of parish, about 10,000.

ERMELAND, or ERMLAND, one of the eleven districts of the old province of Prussia, extending inland from the Frisches Haff. In 1250 it was created one of the four bishoprics of the country of the Teutonic Knights. In 1354 the bishop of Ermeland, who had been subject to the archbishop of Riga, was made directly dependent upon the Pope, and elevated to the position of a prince of the empire. In 1466 West Prussia was transferred to Poland, and the bishop of Ermeland became a member of the

Polish senate. Since 1722 Ermeland and its bishop have again been Prussian.

ERMENONVILLE, a village in the southeast of the department of Oise, in France. It is celebrated for its beautiful and extensive parks, and as being the resting-place of Rousseau. It was also the residence of Gabrielle d'Estrées, the mistress of Henry IV, who inhabited a hunting-tower, part of which is still standing, and bears his name. Ermenonville was purchased by Stanislaus de Girardin, and is preserved for the lovers of art, of Nature, and of historical monuments.

ERNEST II (Duke of Saxe-Coburg and Gotha), **AUGUSTUS-ERNEST CHARLES JOHN LEOPOLD ALEXANDER EDWARD**, who reigns as Ernest II, was born June 21, 1818, succeeded his father Jan. 29, 1844, and married the Princess Alexandrina, daughter of the late Grand Duke Leopold of Baden, brother of the late Prince Consort, May 8, 1842. In 1863 his name was put forward as a candidate for the vacant crown of Greece, but for state reasons he declined it. Duke Ernest, who has labored to promote German unity, gave the stimulus to those liberal movements which induced the Emperor of Austria to make concessions to his subjects. He is an accomplished musician, and has composed several operas which have been produced in Germany with success.

ERRETT, ISAAC (1820-88), an American clergyman. He was a follower of Alexander Campbell, and in 1840 became a preacher. He was pastor in Pittsburgh, Pa., in New Lisbon, Warren, and North Bloomfield, Ohio, in Detroit, Muir and Ionia, Mich., and in Chicago. In 1866 he began the publication of "The Christian Standard," in Cleveland, and in 1868 became the president of Alliance College, but soon resigned to establish the "Christian Standard" in Cincinnati. He was corresponding secretary of the Ohio Christian Missionary Society in 1853-56, and its president in 1867-70; was corresponding secretary of the General Christian Missionary Society in 1857-60, and president in 1874-76, and was president of the foreign mission society in 1875-86.

ERRHINES, medicines administered locally to produce sneezing and discharge from the nostrils, in catarrh, and in various disorders of the head and eyes. Common snuff, and various other vegetable irritants in powder, have been used for this purpose.

ERYNGO, a genus of plants of the natural order *Umbellifera*, having simple umbels, which resemble the heads of composite flowers, a leafy involucre and leafy calyx, and obovate, scaly fruit destitute both of ridges and vittæ. The species are numerous, mostly natives of the warmer temperate parts of the world, with alternate, simple or divided leaves, which have marginal spines.

ERYSIMUM, a genus of plants of the natural order *Crucifera*, tribe *Sisymbriæ*. The pod is four-sided. *Erysimum cheiranthoides*, a branching annual about 18 inches high, with lanceolate, scarcely toothed leaves, and small yellow flowers, is found in North America and many parts of Europe. Some of the plants formerly referred to as *Erysimum* are now included in other genera, as *Sisymbrium* and *Alliaria*.

ERYTHRONIUM, a genus of bulbous-rooted plants of the natural order *Liliaceæ*, with drooping flowers and the segments of the perianth reflexed. *Erythronium dens canis*, the Dog-Tooth VIOLET, so called from the resemblance of its little white bulbs to dog's teeth, is well known.

ERYTHROPHLÆUM, a genus of leguminous trees, sub-order *Mimoseæ*. One species, a native of Guinea, contains a red juice used for poisoning ar-

rows, and also in ordeals. The tree sometimes attains a height of 100 feet.

ERYTHROXYLACEÆ, a natural order of exogenous trees or shrubs, allied to *Malpigiaceæ*. Nearly 100 species are known, natives of warm countries, chiefly of tropical America.

ESBJERG, a port of Denmark, 56 miles west of Fredricia by rail, with a large export trade in cattle, mostly to England. Its harbor, the only one of importance on the west coast of Jutland, was constructed by the state at great expense in 1868-74.

ESCALADE: in siege operations, a mode of gaining admission within the enemy's works. It consists in advancing over the glacis and covert-way; descending, if necessary, into the ditch by the means of ladders, and ascending to the parapet of the curtain and bastions by the same ladders differently placed. The leaders of an escalade constitute a "forlorn hope."

ESCANABA, or **ESCANAWBA**, a city, the county-seat of Delta county, Mich. It is at the north end of Green Bay, has a good harbor, and does a large shipping business, sending out annually 500,000 tons of Lake Superior iron ores. Population, 6,808.

ESCAPE: in law, the evasion of legal restraint; departure from the custody of a sheriff or other officer, or transcending the limits of confinement without due process of law. The term is used also of the liability of a sheriff for suffering a prisoner to escape.

ESCARP: in fortification, the side or slope of the ditch next the rampart, and of the parapet itself. When the ditch of a fortress is dry the escarp is usually faced with mason-work to render it difficult of ascent, and behind this facing there are often passages or casemates for defense. The escarp is always made at as large an angle as the nature of the soil will allow.

ESCARPMENT, a long line of cliff formed by the outcrop of a relatively hard stratum of rock imbedded among more yielding strata, the inclination of which is generally gentle. This structure is the result of denudation; the hard rock projects because it has yielded less readily to the agents of erosion.

ESCARS, large heaps of gravel, consisting chiefly of carboniferous limestone, that were accumulated during the Pleistocene period. They occur in central Ireland, but are identical with the *ösar* of Sweden, and are known also under the name of *kames* in Scot. ind. The gravel is often heaped into narrow ridges, 40 to 80 feet high and from 1 to 20 miles long.

ESCHAR, a slough or portion of dead or disorganized tissue. The name is commonly applied to artificial sloughs produced by the application of caustics.

ESCHELLES, LES, a village in Savoy, situated on the Guier, 12 miles southwest of Chambéry. The valley beyond this village, on the road to Chambéry, is blocked up by a huge limestone rock 800 feet high, over which travelers formerly used to climb by means of ladders—hence the name of the village. Through this mass of limestone a tunnel now extends, which is 25 feet high, 25 feet wide, and 1,000 feet long. The tunnel was projected and commenced by Napoleon I, and finished in 1817 by the king of Sardinia.

ESCHOLTZ BAY, a portion of the Arctic Ocean in Alaska, forming the innermost part of Kotzebue Sound, the first great inlet to the northeast of Bering Strait. It is about long. 161° W., being barely on the outside of the Polar Circle. It is worthy of notice on account of its fossil remains, which, though common on the northern coast of Siberia, are rare on that of the new continent.

ESCOBEDO, MARIANO, Mexican soldier, born in Dos Arroyos, Mexico, in January, 1828. During the war with the United States he armed his subordinates, and attacked small bodies of the invaders; later he fought with the Mexican army at Palo Alto and Resaca de Guerrero. In 1861 Escobedo attained the rank of brigadier-general. In 1862, during the French interference in Mexican affairs, he fought at Puebla and at the hill of Cerro del Borrego. Later he took part in the defense of Puebla against the French forces. In June, 1864, when the empire under Maximilian was established, Escobedo made a short resistance to the new order of things. In November, 1865, he surprised the garrison of Monterey. In June, 1866, the forces of Escobedo captured Saltillo, and in July Juarez established his government in that city. In December, 1866, Escobedo marched on San Luis Potosi, with an army of 15,000 men. On Feb. 1, 1867, he attacked the imperial general, Miramon, and destroyed half his army. At Queretaro the emperor Maximilian, with his two generals, Mejia and Castillo, became prisoners. A court-martial was held, by order of Juarez, and the emperor promptly condemned and shot. In 1875 Escobedo was commander-in-chief of the frontier department of the east, and in 1876 he served as secretary of war. In that year he went to New York city, and later proceeded to San Antonio, Tex., to renew Mexican agitation on his own behalf. From there he ventured to enter Mexico, where he was arrested, and sent as a prisoner to the capital. Here he was tried by court-martial, and narrowly escaped being declared guilty of conspiracy against the government. In 1879 he again went to New York city, on "private business," but in August, 1880, returned to Mexico. From 1882 until 1883 he was president of the supreme military court of justice.

ESMARCH, JOHANNES FRIDRICH AUGUST, a German surgeon, born at Tönning, in Schleswig-Holstein, Jan. 9, 1823. He was educated in the gymnasia at Rendsburg and Flensburg, and studied medicine at Kiel and Göttingen. During the Danish war of 1848 he served as assistant surgeon, later as adjutant of Stromeyer, and in 1850 was promoted to be chief surgeon. He was appointed professor and director of the hospital at Kiel in 1857; became a member of the hospital commission at Berlin in 1866, and during the Franco-German war of 1870 was surgeon-general and consulting surgeon of the army. The latter position he resigned in 1871, and since his return to Kiel he has been constantly engaged in his work as professor and surgeon. He is known to the medical profession throughout the world by his great invention in surgery, the bloodless method of operating on the extremities.

ESPARTERO, BALDOMERO (1793-1879), a Spanish soldier. He entered the army in 1809. In 1816 he was ordered to Peru, and promoted captain. He served with marked bravery in numerous important battles, and in 1825 was appointed chief of the general staff of the Army of Peru. In 1833 he became commander-in-chief of the province of Biscay, and later lieutenant-general. Subsequently he was appointed general-in-chief of the Army of the North, viceroy of Navarre, and captain-general of the Basque Provinces, and in 1839 was created a grandee of the first class, with the title of Duke of Victoria and Morella. In 1840 he was placed at the head of the ministry, and the following year was appointed regent by the Cortes. He retired to England in 1843, but in 1854 returned to Spain and was placed at the head of the ministry. He resigned, however, in 1856. In 1870 he was offered the crown of Spain by several members of the Cortes, but declined it on the ground of great age.

ESPLANADE, the open space intentionally left between the houses of a city and the glacis of its citadel. It requires to be at least 800 paces broad, that the enemy, in case of getting possession of the town, may not be able to assail the citadel under cover of the nearest houses. In old works on fortification the term is often applied to the glacis of the counter-scarp, or the slope of the parapet of the covered way towards the country.

ESPRINGAL, or SPRINGAL, in the military engineering of the days before the introduction of gunpowder into European warfare, was a machine for throwing missiles. These missiles were either large darts called *muchettes*, or arrows winged with brass and called *viretons*, from their whirling motion when shot forth.

ESPRIT DIVA, an aromatic liquor made in Switzerland, from a plant called *Genipi*. Like the *Swiss tea*, made from the same plant, it possesses sudorific properties.

ESPY, JAMES POLLARD (1785-1860), an American meteorologist. In 1808 he became principal of the classical Academy in Cumberland, and later was admitted to the Ohio bar. In 1817 he became a professor in the classical department of the Franklin Institute, Philadelphia. Later he advanced the theory that every great atmospheric disturbance begins with the uprising of air that has been rarefied by heat. In 1840 he visited Europe and presented his views to foreign scientists for examination. They reported favorably on them, but subsequent researches have led to important modifications of his views. In 1843 he received an appointment under the war department, and instituted a service of daily bulletins on the condition of the weather in different localities, which has since developed into an important branch of the war department. He published several volumes of weather reports, besides *Philosophy of Storms*.

ESSAYS AND REVIEWS, the title of a remarkable volume published in 1860, containing the following seven papers: (1) *The Education of the World*, by Dr. Temple; (2) *Bunsen's Biblical Researches*, by Dr. Rowland Williams; (3) *On the Study of the Evidences of Christianity*, by Professor Baden Powell; (4) *The National Church*, by H. B. Wilson; (5) *The Mosaic Cosmogony*, by C. W. Goodwin; (6) *Tendencies of Religious Thought in England, 1688-1760*, by Mark Pattison; (7) *The Interpretation of Scripture*, by Professor B. Jowett. All the writers, except Mr. Goodwin, were clergymen of the Church of England; and their work, which was censured for its heterodox views by nearly all the bishops, and formally condemned by convocation in 1864, caused much excitement and controversy. Dr. Williams and Mr. Wilson were sentenced by the ecclesiastical courts to suspension for a year, but on appeal the sentence was reversed by the Privy Council; and Dr. Temple's election to the see of Exeter in 1869 was also ineffectually opposed.

ESSENCE DE PETIT GRAIN is obtained by distillation from small unripe oranges, about the size of a cherry, and is used as a perfume in the same manner as *orange-flower water*.

ESSEX, a manufacturing town of Middlesex county, Conn., on the Connecticut River. It produces soap and carriages. Pop., 2,035.

ESTHERVILLE, the county-seat of Emmett county, Iowa, situated on the east branch of the Des Moines River. It has excellent educational advantages, grist and saw mills, and a machine shop. The business of the locality is farming and stock raising. Pop., 1,475.

ESTOILE, or SRAR, in heraldry, differs from the mullet by having six waved points; the mullet consisting of five plain points.

ESTRAY: in law, a horse, sheep or other domestic animal found wandering, and the owner of which is supposed to be unknown. By the common law of England estrays belonged to the sovereign. By statute law an estray becomes the property of the person in whose inclosure it is found, if not claimed by the owner within a year and a day. In the United States the law of estrays varies in the different States.

ESTREAT: in English law, a true extract copy, or note of some original writing or record, and specially of fines or amercements, as entered in the rolls of a court, to be levied by bailiffs or other officers.

ESTRÉES, GABRIELLE DE (c. 1571–99), mistress of Henry IV of France, with whom she became acquainted in 1590. She was married to a gentleman of Picardy, named Liancourt, from whom she soon separated. The king was so fond of her that, in spite of the opposition of Sully, he was about to divorce his consort, Marguerite de Valois, that he might marry Mme. de Liancourt, when the latter suddenly died at Paris, April 10, 1599.

ÉTANG DE BERRE, a salt lake of France, in the south of the department of Bouches-du-Rhône, communicating with the sea by a narrow channel, called Port-de-Bouc. It is 11 miles long by 9 broad at its widest part. This lake contains great quantities of eels and other fish. Salt works are in operation on its banks.

ÉTEX, ANTOINE, a French artist, born at Paris, March 20, 1808. He early devoted himself to art, receiving instruction from Ingres and Duban, and in 1828 he secured the second *prix de Rome* by his *Hyacinthus Slain by Apollo*. His statue of Cain, exhibited at the salon of 1833, secured him a commission for two groups for the Arc de l'Étoile, and in 1841 his *Tomb of Géricault* won the decoration of the Legion of Honor. Among his statues are *Hero and Leander*, at the museum of Caen; *Blanche of Castile*, at Versailles; *Charlemagne*, at Luxembourg; *Shipwrecked*, exhibited at the exposition of 1867; *Susanna Surprised at the Bath*. Among his paintings are: *Romeo and Juliet*; *Dante and Beatrice*; *The Great Men of the United States* (now in City Hall, New York); *The Flight to Egypt*. He executed designs for monuments and public works, and engraved a series of designs from the Greek tragic poets. He died in 1888.

ETHELREDA, St., a daughter of the king of the East Angles, canonized in the 7th century for her saintly virtues. Her festival in the calendar is October 17. Her name was popularly abbreviated or corrupted into St. Audrey.

ETHIOPS, or ETHIOPS, a term applied by the ancient chemists to certain oxides and sulphides of the metals which possessed a dull, dingy, or black appearance.

ETHMOID BONE, one of the eight bones which collectively form the cavity of the cranium. It is of a somewhat cubical form, and is situated between the two orbits of the eye, at the root of the nose. Its upper surface is perforated by a number of small openings (whence its name), through which the filaments of the olfactory nerve pass downwards from the interior of the skull to the seat of the sense of smell, in the upper part of the nose. It consists of a perpendicular central plate or lamella, which articulates with the vomer and with the central fibro-cartilage, and thus assists in forming the septum or partition between the two nostrils.

ETHYLAMINE, a substance strongly resembling ordinary ammonia and hartshorn in odor and other properties. It is found in coal tar, in the oil obtained during the destructive distillation of

bones, in the gases evolved during putrefaction, and may be produced by certain complicated chemical processes. Ethylamine is a mobile liquid of specific gravity 696 (water=1000), and boils at 66° F. It has an alkaline action with coloring matters, forms white fumes with strong acids, and in composition is analogous to gaseous ammonia (NH₃ or N H H H), with one of the atoms of hydrogen replaced by ethyl (C₂H₅ or A₂), and is represented

by the symbol C₂H₇, N or N $\begin{pmatrix} \text{H} \\ \text{H} \\ \text{C}_2\text{H}_5 \end{pmatrix}$.

ETIQUETTE: originally, a little piece of paper affixed to a bag or other object to signify its contents. The word came probably to possess the secondary meaning which we now attach to it, of the forms observed in the intercourse of life, more particularly on state occasions, from its having been customary to deliver such tickets, instructing each person who was to take part in the ceremony as to the part which he was expected to play. Cards which are still delivered to mourners at funerals, and those on which the order of the dances is set forth at balls, are of this nature.

ETIVE, a sea-loch in the north of Argyleshire, running inland from the Firth of Lorn, 20 miles east and northeast, with a width of from a quarter of a mile to three miles. It is bordered by granite in its upper part, and by trap in its lower. Near its mouth there is mica-slate on the north side, and Permian strata on the south. The loch abounds in seals, salmon, porpoises, and cod. At the south side of the mouth of Loch Etive, on a projecting conglomerate rock 10 to 30 feet high, are the ruins of Dunstaffnage Castle, the ancient stronghold of the MacDougals, a building in the Edwardian style, with walls 400 feet in circumference, 30 to 50 feet high, and 10 feet thick, and with three round towers.

EU, COMTE D', PRINCE LOUIS PHILIPPE MARIE FERDINAND GASTON D'ORLÉANS, was born at the château de Neuilly, in the department of the Seine, April 28, 1842, is the eldest son of the Duc de Nemours, and one of the grandsons of King Louis Philippe. Brought up in exile, he was educated in England, and entered the military service of Spain in 1859, serving in Morocco. Later he joined the artillery college at Segovia, from which he graduated in 1863. In 1864 he married Isabella, the eldest daughter of Dom Pedro II of Brazil. He was made a field marshal in the Brazilian army in 1865, and in 1869 was appointed commander-in-chief of all the forces on land and sea, a position he retained until the war with Paraguay (begun in 1864) was ended in 1870 by the death of Lopez, dictator of Paraguay. From 1865 to 1889 he held the post of commander-general of the Brazilian artillery, and was president of various commissions. In the many absences of Dom Pedro from the empire during this period, the Comte d'Eu had the virtual direction of all Brazilian affairs. When the revolution of November, 1889, occurred, establishing the Republic of Brazil and deposing the emperor, the Comte d'Eu, with his wife, accompanied Dom Pedro to Portugal, and he has since resided in Europe.

EUFAULA, a city of Barbour county, Ala., on the Chattahoochee River. It is a winter health resort, has a female college, water-works, bagging factory, fair ground, and is a great cotton-shipping point, with a population in 1890 of 4,394.

EUGANEAN HILLS, a range of well-wooded hills, with a north and south axis, lying southwest of Padua in Northern Italy. They owe their origin to eruptions of trachyte during the Jurassic period. The highest point, Monte Venda, reaches 1,749 feet.

EUGENE CITY, the county-seat of Lane county, Oregon, 71 miles south of Salem, on the west bank of the Willamette River. It is a business and educational center, and contains the University of Oregon. Population (1890), 4,000.

EUGENIA, a genus of plants of the natural order *Myrtaceæ*, nearly allied to *Myrtus*, and differing only in having a 4-parted instead of a 5-cleft calyx, four instead of five petals, and one or two-celled berry, with one seed in each cell. The species are trees and shrubs, natives chiefly of tropical and sub-tropical countries.

EUGÉNIE-MARIE DE MONTIJO, empress of the French and wife of Napoleon III, born at Granada, in Spain, May 5, 1826. She is descended on the father's side from an old and noble Spanish family, and by her mother is connected with an ancient Scottish family, the Kirkpatricks of Closeburn. She was educated principally at Madrid, and spent a great portion of her youth in traveling with her mother. In 1851 she appeared in Paris, where her beauty and graceful demeanor won the admiration of the emperor of the French. The wedding was celebrated Jan. 30, 1853, at the church of Notre Dame. One son, the fruit of this union, was born March 16, 1856. On the deposition of the emperor in September, 1870, and the declaration of a republic, Eugénie fled almost alone from France, and took refuge in England, where she was joined by the prince imperial, and in the following March by her husband. The ex-emperor died in 1873, and the prince was killed in the Zulu war, June 1, 1879. His body was brought to England and buried at Chiselmhurst, and the following year the empress went to Zululand to visit the fatal spot on the anniversary of her son's death. At the beginning of the year 1881 the empress removed from Camden House to the Farnborough estate in Hampshire, close to the borders of the county of Surrey. The estate consists of about 257 acres, with a pretentious mansion.

EUOMPHALUS, a large genus of fossil gasteropodous shells, characterized by its depressed and discoidal shell, with angled or coronated whorls, five-sided mouth, and very large umbilicus. The operculum was shelly, round, and multi-spiral. The genus seems related to *Trochus*. It appears among the earliest tenants of the globe, and keeps its place till the Triassic period. Eighty species have been described.

EUONYMIN, an extract from the bark of the *Euonymus atropurpureus*, the Spindle Tree, or Wahoo, a shrub indigenous to the United States. It is used in America as a tonic and diuretic, and in Britain for its stimulant action on the liver.

EUPATORIUM, a genus of plants of the natural order *Compositæ*, sub-order *Corymbifera*, having small flowers (heads of flowers) in corymbs, florets all tubular and hermaphrodite, club-shaped stigmas imbricated bracts, a naked receptacle, and a hairy pappus. The species are numerous and mostly American. Thorough-wort (*E. perfoliatum*), a species having the opposite leaves joined at the base, is used as a medicine.

EUPHEMISM, a figure of rhetoric by which an unpleasant or offensive matter is designated in indirect and milder terms.

EUPHON, or **EUPHONON**, a musical instrument invented by Chladni in 1790. It is similar in tone to the harmonica, and, like it, the tone is produced from the sounding body by the finger direct, without mechanism, and is regulated in quality and effect by the taste and feelings of the performer.

EUPHONIUM, a bass Saxhorn. The *Euphonon*, a variation of the harmonica, was invented by Chladni in 1790.

EUPHORBIA. See *Britannica*, Vol. VIII, p. 668. **EUPHORBIA**, OIL OF, or OIL OF CAPER SPURGE, an extremely acrid fixed oil, obtained by expression, or by the aid of alcohol or ether from the seeds of the caper spurge. This oil much resembles croton oil, for which it is sometimes used as a substitute.

EUPHORBIACEÆ, a very extensive order of dicotyledons, containing upwards of 3,500 known species—trees, shrubs and herbaceous plants—of the most extraordinarily varied, often even cactus-like, habit. They abound in warm countries, and most in tropical America. The few species found in the colder parts of the world are all herbaceous. The *Euphorbiaceæ* usually abound in an acrid and poisonous milky juice; although there are species whose juice is bland, or becomes so through the application of heat. Many of them are valued for their medicinal properties.

EUPHROSINE, one of the Graces.

EUPODA, a family of coleopterous insects of the tetramerous section of the order, deriving their name (well-footed) from the great size of the hinder thighs of many of the species. The body is oblong, the antennæ filiform. Some of them are among the most beautiful of tropical insects.

EURASIANS, a name applied to the offspring of European parents on the one side and Asiatics on the other side, and chiefly used in India of the children whose fathers are Europeans and whose mothers are Hindoos, and their descendants. The term Eurasian is also used in geography for facts true of Europe and Asia (Eurasia) taken as one continent.

EUREKA, a city and county-seat of Humboldt county, Cal., on Humboldt bay, seven miles from the ocean. It has a good harbor and is a shipping-point for redwood lumber. Population, 4,858.

EUREKA, a village in Olio township, Woodford county, Ill., 19 miles east of Peoria. It contains Eureka College, with which is connected a normal school and a Biblical school under the direction of the Disciples of Christ. Population, 1,481.

EUREKA, a city and county-seat of Greenwood county, Kan. Population (1890), 2,259.

EUREKA, the county-seat of Eureka county, Nev., midway between Salt Lake and San Francisco. Mining is the chief business, and large quantities of lead and silver ore are produced. This place is third in importance in the State. Pop., 1,609.

EUREKA SPRINGS, a city and county-seat of Carroll county, Ark., situated in the White River Mountains. Its medicinal springs attract thousands of health-seekers. Population, 3,706.

EUSTIS, JAMES B., an American soldier and statesman, was born in New Orleans in 1834. He was given a classical education and graduated at Harvard Law School in 1854. He practiced law in New Orleans, and at the outbreak of the war he served on the staff of the Confederate General Magruder, being subsequently transferred to the staff of General Joe Johnston, with whom he served to the close of the war. He was elected a member of the State Legislature before the Reconstruction acts, and was one of the committee sent to confer with President Johnson upon Louisiana affairs. In 1872 he was elected a member of the State Assembly, and in 1874 was put into the State Senate for a term of four years, but was called to serve in the United States Senate from 1877 to 1879. After that he became professor of civil law in the University of Louisiana, and held that position when he was again elected Senator by the Democrats in 1884. His term expired in March, 1891. In 1893 he was appointed by President Cleveland as minister to France.

EUTERPE, a genus of palms, having male and female flowers intermingled on the same spadix; the spadices springing from beneath the leaves; the spathe entire, membranaceous and deciduous. They are very elegant, with lofty, slender, smooth faintly fringed stems and pinnate leaves, forming a graceful feathery plume; the base of the leaf-stalk sheathing far down the stem, and so forming a thick column of several feet in length at its summit.

EUTHANASIA, an easy death, or a painless method of putting to death.

EVANSTON, formerly a post-village of Illinois, but now a populous suburb of Chicago, ornamented with many superb residences and substantial public buildings. It is situated 12 miles north of the city hall. It possesses a ladies' college and the Garrett Biblical Institute, and is the seat of the Methodist Northwestern University. Evanston stands in about the same relation to Chicago that Brooklyn does to New York. While not politically annexed, the majority of her citizens pursue their business avocations in Chicago, and her absorption by the western metropolis is simply a question of time. Its population in 1890 was 14,000. Evanston has now a city charter.

EVANS, FREDERICK WILLIAM, an American reformer, born in 1808. In 1880 he joined the Shakers at Mt. Lebanon, N. Y.; was appointed assistant elder in the "North Family" in 1838, and twenty years later became elder of the three "families." Besides contributing to seventy different publications, he is the author of several works concerning his sect.

EVANSTON, the county-seat of Uintah county, Wyo., on the Bear River, midway between Omaha and San Francisco. Coal and iron are found in the vicinity. The town has railroad machine shops, employing a large number of men.

EVANSVILLE, a city of Indiana, and county-seat of Vanderburg county (see Britannica, Vol. VII, p. 727). Evansville has 10 lines of railway, and 8 steamboat lines. The city is built over two veins of soft coal, and within a radius of 30 miles 60 coal shafts are in operation. The public school system is excellent. There are 12 public school buildings, valued at \$423,207. High schools are provided for both colored and whites, the races being taught separately. There is a fine public library and art gallery. There were, in 1891, 260 manufacturing establishments. The hard wood lumber trade is enormous, said to be the largest in the country. The production of flour reaches 630,000 barrels annually, and 15,000,000 brick are yearly manufactured within the city limits. Evansville has grown rapidly during the last decade. Population in 1880, 29,280; in 1890, 50,674.

EVANSVILLE, a village of Rock county, Wis. It contains a seminary, a steam cabinet-manufacture, and a machine shop. Population, 1,523.

EVART, a lumbering town of Osceola county, Mich., containing saw and shingle-mills, a machine shop, and a foundry. Population, 1,269.

EVARTS, JEREMIAH (1781-1881), an American philanthropist. From 1806 to 1810 he practiced law in New Haven, Conn.; was editor of the "Panoplist" from 1810 to 1820, when he was made editor of the "Missionary Herald"; in 1812 became treasurer of the American board of commissions for foreign missions. In 1821 he was chosen corresponding secretary of the board, and retained the position until his death. He published several essays and speeches.

EVARTS, WILLIAM MAXWELL, a United States ex-Senator, born in 1818. He studied in the Harvard Law School, and was admitted to the bar in

New York in 1841; was chairman of the New York delegation in the National Republican convention of 1860; was Attorney-General of the United States from July 15, 1868, to March 3, 1869; received the degree of LL.D. from Union College in 1867, from Yale in 1865, and from Harvard in 1870; was counsel for President Johnson on his trial upon his impeachment in 1868; was counsel for the United States before the tribunal of arbitration on the Alabama claims at Geneva, Switzerland, in 1872; was counsel for President Hayes, in behalf of the Republican party, before the Electoral Commission; was Secretary of State of the United States from 1877 to 1881; was elected to the United States Senate as a Republican from New York, in the place of Elbridge G. Lapham, Republican, and took his seat March 4, 1885. His term of service expired March 3, 1891.

EVE, PAUL FITZSIMONS (1806-77), an American physician. He graduated at the medical department of the University of Pennsylvania in 1828; studied in London and Paris; served as an ambulance surgeon during the revolution of 1830, and as a regimental surgeon in the Polish war. In 1831 he returned to the United States, and in 1832 became professor of surgery in the Medical College of Georgia. In 1849 he was elected surgical professor in the University of Louisville; in 1850 in the University of Nashville; in 1868 in the University of Missouri, and later returned to Nashville as professor of operative and clinical surgery. In 1877 he became professor of the principles of surgery in the Medical College at Nashville. During the civil war he served with the Confederate army in Mississippi and Georgia. He published several works on surgery, besides contributing extensively to various medical journals.

EVERETT, a city of Massachusetts, located in Middlesex county, in the extreme eastern portion of the State. It adjoins Boston, with which it is connected by the Eastern Railroad. It is supplied with water from the Mystic Water-works of Boston. Prior to 1870 it formed a part of Malden. It has an excellent system of public schools. Population in 1880, 4,159; in 1890, 11,068.

EVERETT, a borough of Bedford county, Pa., 9 miles east of Bedford.

EVERETT, ROBERT W., a farmer, born near Hayneville, Ga., March 3, 1839. He was educated at Mercer University, Ga., graduating in 1859, and becoming a teacher. He served in the Confederate army during the war of the Rebellion. In politics a Democrat, he served two years as commissioner of revenues, and twelve years as a member of the board of education, being its chairman four years. He was elected a member of the State House of Representatives in 1882, and served four years, being chairman of the committee on agriculture in 1884 and 1885. In 1890 he was elected a Representative from the Seventh Congressional District of Georgia to the 52d Congress.

EVERGREENS. See Britannica, Vol. II, p. 319.

EVERSLEY, a village of northeast Hampshire, England, 13 miles northeast of Basingstoke. Charles Kingsley was rector of the parish from 1842 until his death in January, 1875, and is buried in the churchyard.

EVICION. See Britannica, Vol. XIV, p. 275; Vol. XX, p. 403.

EWBANK, THOMAS (1792-1870), an American scientist. From 1819 to 1836 he was employed in New York, first as a machinist, and then in the manufacture of metallic tubing. He retired in 1836 to devote himself to literature and scientific pursuits. From 1849 to 1852 he was United States Commis-

sioner of Patents. He published, among other works, many books on scientific subjects.

EWELL, RICHARD STODDERT (1817-72), an American soldier. He served in the Mexican war, and against the Apaches in New Mexico in 1857. At the beginning of the civil war he entered the Confederate army, and was actively engaged throughout the war. He several times won distinction and attained the rank of lieutenant-general. After the war he retired to private life.

EWER, FERDINAND CARTWRIGHT (1826-83), an American clergyman. In 1857 he was ordained deacon in the Protestant Episcopal church, and a year later became priest. He labored two years in Grace church, San Francisco, and then returned to the East, where he was appointed assistant minister in St. Ann's church, New York city. From 1862 to 1871 he was rector of Christ church, and then for a time of St. Ignatius. In 1883, while preaching in St. John's church, Montreal, he was stricken with paralysis, and died three days later. He was the author of several works on theology.

EWING, a village of Franklin county, Ill. It is the seat of Ewing College, and contains a large woolen factory.

EWING, JULIANA HORATIA ORR, writer for children, born at Ecclesfield, Yorkshire, in 1842, died at Bath, May 13, 1885. She early began to compose nursery plays for her brothers and sisters, which they performed, her brother, Alfred Scott Gatty, acting as musical director. Mrs. Ewing was a graceful writer, and her studies of children and child-life were simple and natural. In 1867 she married Major Alexander Ewing.

EWING, THOMAS (1789-1871), an American statesman. From 1816 to 1831 he practiced law in Lancaster, Ohio, and from 1831 to 1837 served as United States Senator. In 1841 he became Secretary of the Treasury, and in 1849 Secretary of the Interior. In 1850 he was appointed United States Senator, but resigned the following year and resumed his law practice in Lancaster. In 1829 Mr. Ewing adopted William T. Sherman, then a boy of nine, into his family.

EXCALIBUR, the famous mystic sword of King Arthur, which was given him, as Merlin promised, by the Lady of the Lake, and at his death was flung into the river and caught up by a hand which rose above the waters.

EXCEMENTOSIS, a new word now used in dental literature as a substitute for *exostosis*, in describing a morbid, bony growth on the surface of the teeth. See DENTISTRY, in these Revisions and Additions.

EXCIPIENT, an inert or slightly active substance, introduced into a medical prescription as a *vehicle*, or medium of administration for the strictly medicinal ingredients.

EXCITANTS, or STIMULANTS, those pharmaceutical preparations which, acting through the nervous system, tend to increase the action of the heart and other organs. They all possess an acrid and pungent taste, and give a sensation of warmth when placed on a tender part of the skin.

EXCLUSION BILL, a proposed measure for excluding the Duke of York, afterwards James II, from succession to the throne, on account of his avowed Roman Catholicism. A bill to this effect passed the Commons in 1679, but was thrown out by the Upper House (see Britannica, Vol. VIII, p. 350). As the new Parliament summoned in 1681 seemed determined to revert to this measure, it was dissolved, and Charles ruled henceforth without control.

EXCULPATION, LETTERS OF: in the law of Scotland, the warrants granted to the accused party, or

panel as he is called, in a criminal prosecution, to enable him to cite and compel the attendance of such witnesses as he may judge necessary for his defense.

EXECUTION: in criminal law, the infliction on criminals of the punishment of death in conformity with legal decree.

EXECUTION: in law, the act of completion or carrying into effect. Thus a writ is executed by obeying the instructions contained in it; a deed when it is signed, sealed, and delivered; a power when it is exercised; a judgment of a court when it is enforced.

EXECUTORY: in English law, a term applied to contracts, etc., which are not executed—that is, not completed with the forms required to make them legally operative. In American law, the term executory is used as in England.

EXERCISE, a very important element of medical regimen, both in the preservation of health and in the cure of disease.

EXETER, one of the county-seats of Rockingham county, N. H., on the Squamscott River, 50 miles north of Boston. The well-known Phillips Academy is here, also Robinson Female Seminary. It has a cotton mill, railroad round-house, and manufactures castings, Population, 4,284.

EXETER HALL, a large proprietary building, on the north side of the Strand, London. It was completed in 1831, and can contain upwards of 5,000 persons. It is let chiefly for religious assemblies, and is in great demand during the "May Meetings" of the several religious societies. It has also been used for musical fêtes. In 1880 it was purchased for £25,000 for the Young Men's Christian Association.

EXHAUSTIONS, METHOD OF, a mode of proving mathematical propositions regarding quantities by continually taking away parts of them. The method was frequently employed by the ancient geometers; its fundamental maxim, as stated by Euclid, being that those quantities are equal whose difference is less than any assignable quantity.

EXMOOR FOREST, a moory, mostly uncultivated waste, consisting of dark ranges of hills and lonely valleys, 14 square miles in area, in the west of Somersetshire and northeast of Devonshire, England. It is bordered by deep-wooded glens. The hills rise in Dunkery Beacon to 1,668 feet, in Chapman Barrow to 1,540, and in Span Head to 1,510. Devonian slates, with some New Red Sandstone in the north, form the substratum. It is covered with heath, juniper, cranberry, and whortleberry, and has some meadow-land. Throughout this tract there is a native breed of ponies, known as Exmoor ponies, reputed stout and hardy. Iron is mined here.

EXOGENOUS PLANTS, or EXOGENS, a term applied to dicotyledons by Lindley to express an erroneous view of the difference in the mode of stem-thickening from that of monocotyledons, and now wholly disused by botanists.

EXOSTEMMA, a genus of American trees and shrubs of the natural order *Cinchonaceæ*, nearly allied to *Cinchona*. Several species yield febrifugal barks, which, however, do not contain the cinchona alkaloids. The most valued are Caribbee Bark and Saint Lucia Bark.

EXOTIC PLANTS, or EXOTICS, cultivated plants originally derived from foreign countries. The term is generally applied to those whose native country differs so much in soil or climate from that into which they have been conveyed that their cultivation is attended with difficulty, requiring artificial heat or other means unlike those requisite in the case of indigenous plants.

EXPECTATION WEEK, the name given to the period elapsing between Ascension Day and Whitsunday, because during this time the Apostles continued praying in earnest expectation of the Comforter.

EXPECTORANTS, medicines given to carry off the secretions of the air-tubes.

EXPECTORATION, the mucus or other secretion discharged from the air-passages.

EXPERIMENT, the means by which we extend and confirm our knowledge of Nature. An experiment is properly a proceeding by which the inquirer interferes with the usual course of a phenomenon, and makes the powers of Nature act under conditions that, without his interference, would never, perhaps, have presented themselves all together.

EXPERT, a person of special practical experience or education in regard to a particular subject—a word commonly applied to medical or scientific witnesses in a court of justice, when selected on account of special qualifications, as in the case of an analysis of the contents of the stomach in suspected poisoning. It is also applied to one professionally skilled in handwriting, for detecting forgery of deeds and signatures.

EXPLOSIVES, substances by whose decomposition or combustion gas is generated with such rapidity that they can be used for blasting or in fire-arms (see *Britannica*, Vol. VIII, pp. 806-813). They may be classed generally as follows:

Gunpowder.	Nitro compounds.
Gun-cotton.	Picric acid.
Fulminates.	

The nitro-compounds are nitro-cellulose, nitro-glucose, nitro-starch, and nitro-glycerine and its compounds. The fulminates are fulminating mercury, fulminating silver, chlorate of potassium and sulphide of antimony, sulphur and chlorate of potassium, and red phosphorus and chloride of potassium. The mixture of nitro-glycerine with dry pulverized absorbent substances has given rise to a variety of explosives, of which the name dynamite is perhaps generic. Among these mixtures are:

Dualin.	Jupiter powder.
Giant powder.	Lignose.
Hercules powder.	Mica powder.
Neptune powder.	Titanite.
Potential powder.	Titan powder.
Rendrock.	Vigorite.
Sebastine.	Vulcan powder.
Thunderbolt powder.	

The relative efficiency of the various modern explosives is shown by the following table, which is the result of two years' trial by the United States Board of Army Engineers. Ordinary dynamite is taken as the standard:

Dualin.	111.
Hercules powder No. 1.	106.
Dynamite, No. 1.	100.
Rendrock.	94.
Gun-cotton.	87.
Dynamite, No. 2.	83.
Hercules powder, No. 2.	88.
Mica powder.	83.
Vulcan powder.	82.
Nitro-glycerine.	81.
Blasting gunpowder, No. 1.	30.

For a description of the various explosives, see their respective headings.

EXPONENT AND EXPONENTIAL. When wanting to express the multiplication of unity for any number of successive times by the same number or quantity, *e. g.*, $1x5x5$, or $1xaxaxa$, it was found more convenient to write $1x5^2$ or simply, 5^2 and a^2 , and the numbers, 2 and 3, indicating how often the

operation of multiplication is repeated, were called exponents. But the theory of exponents gradually received extensions not originally contemplated, and has now an extensive notation of its own. Thus $a^0=1$, $a^1=a$, $a^2=1+a^2$, $a^{\frac{1}{2}}=\sqrt{a}$, $a^{\frac{1}{3}}=\sqrt[3]{a}$, $a^{\frac{2}{3}}=\sqrt[3]{a^2}$, or the cube root of the square of a . Also A^x is the X th power of A , X being any number integral or fractional; and, A continuing the same, X may be so chosen that A^x shall be equal to any given number. In this case, X is called the logarithm of the number represented by A^x . Considered by itself, A^x is an exponential. Generally, any quantity representing a power whose exponent is variable, is an exponential, as A^x , H^x , Y^x , etc. Exponential equations are those which involve exponentials, such as $A^x=b$, $H^x=c$.

EX POST FACTO LAW, any criminal or penal statute rendering an act punishable in a manner in which it was not punishable when it was committed. Any law which would make an act criminal which was not criminal when done, or which would increase the severity of the punishment of a previous act, or which would alter the rules of evidence or procedure so as to put one accused of a crime committed previous to the law in a worse position before the courts, is prohibited by the Constitution of the United States.

EXPRESS, a system in vogue in the United States for the transportation of articles of moderate weight and bulk from one point to another. It was originated by William Frederick Harnden in 1839, and has been since greatly extended. The bulk of the business is now done by express companies, who, upon the acceptance of a parcel, guarantee its safe delivery and become responsible as common carriers. A peculiar feature of the business is the delivery of articles purchased at a distance and the collection from the purchaser of the price agreed on, known as the "collect on delivery" system. All the express companies issue money orders on payment of a small fee.

EXTENSION: in logic, a word put into contrast with another term, **COMPREHENSION**, and the two mutually explain each other. A general notion is said to be extensive according to the extent of its application, or the number of objects included under it.

EXTENT: in English law, a writ issuing out of the court of exchequer to compel payment of debts to the crown.

EXTENUATING CIRCUMSTANCES, those circumstances, in connection either with the position of the prisoner or with the act alone which are taken into consideration by the court in mitigation of the punishment. The previous good character of the person convicted may always be proved as a circumstance giving him some claim to leniency of punishment. Besides character, there are other circumstances which sometimes serve to mitigate the sentence, sometimes to take the act done out of the category of crime altogether. One is youth. Thus, no act done by any person under seven years of age is a crime. Defective mental power in the person convicted will always be considered in determining the severity of his sentence. Disease of mind, such as prevents a man from knowing that the act he does is wrong, will excuse him from consequences of an act otherwise criminal.

EXTORTION: in law, the offense or illegal act committed by a public officer who, under color of his office, takes from any person any money or valuable thing, which is not due from him at the time when it is taken. The act is a misdemeanor, and punishable as such.

EXTRACT OF MEAT is obtained by acting upon chopped meat by cold water, and gradually heating,

when about one-eighth of the weight of the meat is extracted, leaving an almost tasteless insoluble fibrine.

EXTRACTIVE MATTER, the term applied to certain organic matters resembling humine, which are found in soils during the decay of vegetable matter, and are precipitated during the concentration of water solutions.

EXTRACTS: in a technical sense, medicinal preparations of vegetable principles, obtained either by putting the plants in a solvent or menstruum, and then evaporating the liquid down to about the consistency of honey, or by expressing the juice of the plants and evaporating; this last is properly *inspissated juice*. Extracts, therefore, contain only those vegetable principles that are either held in solution in the juices of the plants themselves, or are soluble in the liquids employed in extracting them, and at the same time are not so volatile as to be lost during evaporation. As many extractive matters are more or less volatile it makes a great difference whether the operation is conducted at a low or a high temperature. Extracts are called *watery* or *alcoholic* according as the menstruum employed is water or spirits. Ether is sometimes used in extracting.

EXTRAVASATION, the escape of any of the fluids of the living body from their proper vessels through a rupture or injury in their walls. Excrementitious matter thus sometimes escapes into the abdomen through a wound or ulceration of the bowels. But the term is oftenest used in speaking of the escape of blood from injured blood-vessels. Extravasation is distinguished from exudation by this, that in the latter the vessels remain entire, and the effusion takes place by filtration through their walls; only a part of the blood escapes, the blood globules being retained, while in extravasation perfect blood is effused. Many kinds of extravasation are immediately fatal, such as that of urine or gall into the abdomen, or of blood from the vessels of the brain in many cases of apoplexy. The dark color resulting from a bruise is owing to extravasated blood from ruptured capillary vessels.

EXUMAS, a part of the group of the Bahama Islands, comprising Great Exuma, Little Exuma and the Exuma Keys. They contain about 2,000 inhabitants, who are employed partly in agriculture, but chiefly in salt making. In 1851, the Exumas exported 115,356 bushels of salt. Little Exuma is the second most important port of entry in the Bahamas.

EXUVIÆ, a term applied to organic remains, now seldom employed, but frequently used by the older geologists.

EYÄLET, next to a province, the largest and most important of the divisions of the Turkish Empire, which contains in all 36 eyalets. Each eyalet or general government is administered by a pasha, who is governor. The governors belong to the Dignities of the Sword, and are pashas of two tails; when they are raised to the rank of vizier, as is frequently the case, they become pashas of three tails.

EYAM, a village in North Derbyshire, England, five miles north of Bakewell, with a population of 1,038, chiefly engaged in lead mining. Here, in September, 1665, the plague, then raging in London, broke out in its most virulent form. William Monpesson, the rector of the parish, aided by Thomas Stanley, devoted himself to the care of the dying with the most heroic courage. The plague lingered 13 months and 260 out of a population of 350 perished.

EYE, JOHANN LUDOLF AUGUST VON, a German art historian, born at Fürstana, in Hanover, May 24, 1825, and educated at the gymnasium in Osnaburg, and at the University of Göttingen. In 1853 he was appointed director of the collection of art and antiquities in the museum at Nuremberg, in 1874 accepted a professorship in Rio Janeiro, Brazil, but the following year returned to take charge of the art museum in Dresden. In 1881 he returned to Brazil. He has published *Deutschland vor drei hundert Jahren in Leben und Kunst* (1857), *Eine Menschenseele, Spiegelbild aus dem 18 Jahrhundert* (1863), *Wesen und Werth des Daseins* (1870), and *Das Reich des Schönen* (1878).

EYEBRIGHT (*Euphrasia*), a genus of plants of the natural order *Scrophulariceæ*, having a tubular calyx, the upper lip of the corolla divided, the lower of three nearly equal lobes, the cells of the anthers spurred at the base, a two-celled capsule and striated seeds. Some of the species are root parasites. They are natives of Europe and Asia. The common eyebright (*E. officinalis*) is a little plant about six inches high, with ovate serrated leaves, and white or reddish flowers streaked with purple, appearing singly in the axils of the leaves. It is abundant in pastures and on mountains, and has been used as a medicine in diseases of the eyes, and catarrhal affections. It is a weak astringent.

EYÖT, a little island in a river, especially one overgrown with willows, as in the Thames.

EYRE, a salt lake of South Australia, lying north of Spencer Gulf, at an altitude of 79 feet, and having an area of 3,706 square miles. Except in the rainy season, this lake is generally a mere salt marsh. It was discovered in 1840 by Eyre.

EYRE, EDWARD JOHN, a British diplomatist, born in 1815. He served for sometime as governor of New Zealand, and in 1854 was appointed lieutenant-governor of the island of St. Vincent. In 1859-60 he acted as the administrator of the Leeward Islands. In 1862 he was appointed to administer the government of Jamaica and its dependencies, and in 1864 was appointed captain-general, governor and vice-admiral. He was afterwards recalled on charges of unnecessary severity in suppressing an insurrection; but the accusations were never substantiated. See *Britannica*, Vol. III, p. 105, and *JAMAICA*, Vol. XIII, p. 551.

EYRIA PENINSULA, on the south coast of South Australia, triangular in shape, its base being formed by the Gawler Range, while its sides are washed on the southeast by Spencer Gulf, and on the southwest by the Great Australian Bight. It is a rich pastoral country.

F

F—FACTORY LEGISLATION

F, in music, is the fourth note of the natural diatonic scale of C, and stands in proportion to C as 4 to 3, and is a perfect fourth above C as fundamental note. F major, as a key, has one flat at its signature: namely, B flat. F minor has four flats, the same as A flat major, of which it is the relative minor.

FAAM, or FAHAM, an orchid, native of Madagascar, prized for the fragrance of its leaves, which is owing to the presence of *Coumarin*. In Mauritius an infusion of faam leaves is in great repute as a cure for pulmonary consumption.

FABLIAUX, an appellation given in old French literature to a class of short metrical narratives, intended for recitation; the tales of the Trouvères.

FABRE, CHARLES EDWARD, born in Montreal, Canada, Feb. 23, 1827, was ordained priest in 1850; became bishop in 1873; was translated to Montreal in 1876, and on June 8, 1886, became the first Catholic archbishop of Montreal.

FABRE, LOUIS K. H., brother of the foregoing, born in Montreal Aug. 9, 1834, was called to the bar in 1856, and has long been connected with the newspaper press of Quebec. He entered the senate in 1875.

FABRONI, GIOVANNI, V. M. (1752–1822), director of the physical cabinet of the Grand Duke of Tuscany. He constructed many important military bridges, and in 1815 became professor of natural science at Pisa University.

FABVIER, CHARLES N. BARON (1782–1855), a French officer who became a peer of France in 1845, and a member of the legislative assembly in 1849. He served in Spain, Greece and France.

FAÇADE, the exterior front or face of a building. This term, although frequently restricted to classic architecture, may be applied to the front elevation of a building in any style. It is generally used with reference to buildings of some magnitude and pretensions; thus, we speak of the *front* of a house, and the *façade* of a palace. The sides of a court or cortile are also called *façades*.

FACET, a term employed to denote the plane surfaces of crystals, or those artificially cut upon precious stones.

FACIAL NEURALGIA, pain in parts of the head and face rendered sensible by connection with the trigeminus nerve. It is caused by a morbid state of the nerve-center or other pathological condition.

FACIAL PARALYSIS arises from a loss of the motor property of the nerve supplying the facial muscles, and results in a loss of expression on the affected side, and a drawing of the mouth and other features to the healthy one.

FAC-SIMILE, an exact copy, as of handwriting.

FACTOR: in mathematics, one of the quantities which, multiplied together, form the product. The numbers 6 and 4 multiplied together, make 24; hence 6 and 4 are called factors of the product 24. Most numbers are products of two or more factors: $12 = 3 \times 4$, or 2×6 , or $2 \times 2 \times 3$.

FACTORY, a term contracted from *manufactory*, applied to a building, or collection of buildings, appropriated to the making of goods on an extensive scale. In the United States the factory system has had a rapid growth. At the close of the Revolutionary war factories were practically un-

known in this country, while now the number of manufacturing establishments exceeds 300,000, and the value of the products is greater than that of any other country. For information concerning the number of factories of the various countries, hands employed, wages paid, value of products, etc., see MANUFACTURES, in these Additions and Revisions.

FACTORY LEGISLATION IN AMERICA. The British "Factory and Workshop act" has no counterpart in the United States. A few of the States have adopted laws regulating the age at which children can be employed in factories, and prescribing the number of hours constituting a day's work.

In New Hampshire, Vermont, Massachusetts and New Jersey, no child under ten years of age can be employed in any factory. In Rhode Island the minimum age is twelve, and in Pennsylvania, thirteen. The factory legislation of Connecticut forbids the employment of any child under 14 years of age, unless such child shall have attended school at least two months during the preceding year; and no child under 15 can be employed in any factory more than ten hours per day.

In Maine no child under 12 years of age can be employed in any cotton or wool factory without having attended a public or private school at least four months during the year preceding such employment. Between 12 and 15 years of age such child must have attended school at least three months during the previous year.

In Maryland, no children under 16 years of age may be employed in factories for more than ten hours per day.

Massachusetts has taken more advanced steps in factory laws, and provides inspectors for their enforcement. In this State no child under 14 may be employed, except during school vacations, unless he has for 20 weeks during the preceding year attended school. No minor under 18 years and no woman shall be employed more than 60 hours in a week.

In New Hampshire no child under 12 years of age shall be employed in any factory unless he has attended the school of his district the whole time it was in session. Between 12 and 14 such child must have attended school six months. Between 14 and 16 twelve weeks' school attendance is required. No child under 15 years of age can be employed more than 10 hours per day, except by the written consent of parent or guardian.

In New Jersey no minor may be required to work more than ten hours on any day.

The New York act provides that no children under 14 years of age shall be employed during school hours, unless they attended school 14 weeks of the preceding year.

In Ohio 14 is the age under which no child may be employed during school-hours unless he has attended school 12 weeks during the year preceding.

In Pennsylvania no child between the ages of 13 and 16 shall be employed more than nine months; three consecutive months being allotted to school attendance.

In Rhode Island no child between 12 and 15 years of age may be employed more than nine months

in any year; and then not unless he has devoted three months of the preceding year to schooling.

The factory act of Vermont provides that children between 10 and 15 years of age shall not be employed in factory or mill unless they have attended school at least three months during the preceding year, and are not to be employed more than ten hours per day.

FACULÆ, in astronomy, are spots brighter than the rest of the surface, which are sometimes seen on the sun's disc. They are assumed to be elevated portions of the photosphere.

FACULTY, a name applied to certain powers of the mind, chiefly of the intellect. In discussing the intellect, whatever are considered its fundamental functions are its faculties. According to the older metaphysicians, the leading intellectual faculties are perception, memory, reasoning and imagination; these, however, would not now be considered as giving the ultimate analysis of the intellect. Conscience, or the moral sense, has sometimes been called the *moral faculty*.

FAED, JOHN, a Scottish painter, born at Burley Mill, near Gatehouse-of-Fleet, Kirkcudbrightshire, in 1820. His love of art was early manifested, and when hardly in his teens he made tours through the villages of Galloway, painting miniatures. In 1841 he went to Edinburgh and in 1861 to London, where his talents won recognition. In 1880 he returned to Gatehouse-of-Fleet, and his recent pictures have been chiefly landscapes.

FAED, THOMAS, R. A., brother of John Faed, born at Burley Mill, June 8, 1826, and in 1842 began his regular art studies in Edinburgh. At the Trustees Academy he took several prizes. In 1849 he was made an associate of the Royal Scottish Academy; in 1861 he was made A. R. A. and R. A. in 1864, and elected an honorary member of the Vienna Royal Academy in 1875.

FAGGING, a usage in the great public schools of England, in virtue of which the senior boys are authorized to exact a variety of services from the junior boys. A lower form boy has certain duties to perform to all the upper form boys, as in stopping the balls for them when practicing cricket—and others which he owes to a special master, such as stoking his fire and carrying his messages of a more or less private kind. In American colleges the freedom taken, under the name of *hazing*, by sophomore and senior students with freshmen, is open to even more serious objections.

FAGOT-VOTES, votes manufactured chiefly for county elections, by the nominal sale of property, under mortgage or otherwise, so as to qualify the holder to vote. The term *fagot* described formerly a person who was hired to fill up another's place at the muster of a regiment, or to conceal a deficiency in its strength.

FAIDHERBE, LOUIS LÉON CÉSAR, French general, statesman, and archaeologist, born at Lille, June 3, 1818, died in 1889. He studied at the École Polytechnique and at Metz, afterwards serving as a military engineer in Algeria and the West Indies. Made governor of Senegal in 1854, he rendered the French dominion in Africa great service by his accurate knowledge of the country and its population. At the commencement of the war with Germany he had command of Bona in Algeria, and when the armies were reorganized in 1870 he was appointed general of division and commander-in-chief of the North. He commanded in the battle of Point-Noyelles, relieving Havre from siege, and also in that of Bayaume. Although his little practiced forces were afterwards defeated by the Germans, he proved himself a very able commander.

Joining the party of Gambetta, he was elected to the national assembly in 1871. He retired from public life when the government of Thiers came into power. He was sent on a scientific expedition to Egypt, and subsequently published several works on archaeological topics. He also published a book on the war, *Campagne de l'Armée du Nord*. Gen. Faidherbe was grand-chancellor of the Legion of Honor.

FAIENCE, or FAYENCE, a general term for all sorts of glazed earthenware and porcelain. The origin of the name is disputed. Some derive it from Fayence, a small town of Provence, others from Faenza, a city of Italy; while certain writers consider the Isle of Majorca the place where it was originally manufactured, as the Italians still call faience *Majolica* or *Mayolina*.

FAI-FO, a seaport of Anam in Cochinchina in the province of Quang-Nam situated on a river, near its mouth, communicating with Tooron, 15 miles to the north, by means of a canal. It exports sugar and cinnamon, its principal trade being with China. Population, 15,501.

FAILLON, MICHEL E. (1799-1870). He was a priest of the Sulpician order, who came from Paris to Canada as visitor to Sulpician houses of the country, and wrote biographies and histories of the French in Canada.

FAILLY, DE CHARLES ACHILLE, born in 1810, a French general, who introduced the Chassepot gun.

FAIRBAIRN, SIR ANDREW, born at Glasgow in 1828, was educated at Leeds, Geneva and Glasgow, and in 1846 became a pensioner at Christ's College, Cambridge. He was called to the bar at the Inner Temple in 1852, and attended Northern Circuit until 1856. He then relinquished practice, and in 1860 became a partner in the firm of his father, on whose death in 1861 he succeeded to the business. In 1866 he was elected mayor of Leeds, and in 1873 was appointed royal commissioner to the Paris exhibition. In 1880 he was member for the eastern division of the West Riding, and in 1885 the first representative of the Otley division. The same year he was appointed vice-president of the railway congress at Brussels, and was made a knight commander of the order of Leopold by the king of the Belgians.

FAIRBAIRN, ANDREW M., theologian, principal since 1886 of Mansfield College, Oxford, was born in 1838 in Edinburgh, Scotland, and educated at the Universities of that place, of Glasgow and of Berlin. His first pastorate, in 1860, was at Bathgate, Linlithgow, Scotland. In 1877 he was principal of Airedale (Congregational) College at Bradford, England, and in 1883 was chairman of the Congregational Union of England and Wales. Dr. Fairbairn has written *Studies in the Philosophy of Religion and History*, *Studies in the Life of Christ*, and other works, and is an eloquent preacher. He visited America in 1890.

FAIRBAIRN, PATRICK, D.D., born in Scotland in 1805, died in 1874. He was principal and professor of systematic theology and New Testament exegesis in the Free Church Theological College of Glasgow. He visited the United States in 1871.

FAIRBANKS, ERASTUS (1792-1864), an American manufacturer. In 1824, with his brother Thaddeus, he began the manufacture of cast-iron plows and stove-castings, in St. Johnsbury, Vt., and in 1831 they gave their entire attention to making platform scales. In 1836-38 Erastus was a member of the legislature, and in 1849 was president of the Passumpsic Railroad company; in 1851 and again in 1860 was elected governor of Vermont.

FAIRBURY, the county-seat of Jefferson county, Neb., on the Little Blue River. It has fine water-

power, flouring-mills, soap factory, and tree-packing house of a large nursery. Pop. (1890), 2,630.

FAIRBURY, a town of Livingston county, Ill., situated in a fertile region where coal, limestone, sandstone, fire-clay, micaceous quartz and clay of nearly every color are found. The town has grain elevators, mills and factories. Pop. (1890), 2,324.

FAIRCHILD, JAMES HARRIS, an American divine and educator, born at Stockbridge, Mass., in 1817. He entered Oberlin College in 1833; became tutor in 1839; professor of languages in 1842; of mathematics in 1852; of theology in 1858, and was made president in 1866. He has edited *Memoirs of Charles G. Finney* (1876), and *Finney's Systematic Theology* (1878), and is the author of *Oberlin, the Colony and the College* (1833), *Moral Philosophy* (1869), and *Women's Right to the Ballot* (1870).

FAIRCHILD, LUCIUS, an American statesman, born in 1831. He was admitted to the Wisconsin bar in 1860. At the beginning of the civil war he entered the Federal army as captain in the 1st Wisconsin regiment, and three months later was commissioned a captain in the 16th regiment of the Regular Army, and about the same time a major in the 2d Wisconsin infantry. In 1863 he became a brigadier-general, and the same year was elected Secretary of State in Wisconsin. From 1865 to 1871 he was governor of the State; was United States consul at Liverpool from 1872 to 1878; was consul-general in Paris from 1878 to 1880, and United States minister to Spain in 1880-82. In 1886 he became commander-in-chief of the Grand Army of the Republic.

FAIRFAX, a village of Franklin county, Vt. It has the New Hampton Theological and Literary Institution (Baptist), and manufactories of woollens, lumber and leather. Population (1890), 1,523.

FAIRFIELD, the county-seat of Wayne county, Ill. It contains a woolen factory, flour and saw mills. Population (1890), 1,881.

FAIRFIELD, a city and county-seat of Jefferson county, Iowa. It is the seat of Parsons College and a female seminary. Population (1890), 3,391.

FAIRFIELD, a village of Somerset county, Me., on the Kennebec River, 21 miles north of Augusta. It has canning factories, furniture factories, a tannery, foundry and a framing-mill, where buildings are manufactured entire. Population (1890), 3,510.

FAIRFIELD, the county-seat of Freestone county, Texas. It has two colleges.

FAIRFORD, a village of Gloucestershire, nine miles east of Cirencester, and 26 miles west southwest of Oxford. Its fine church, built in the 15th century, is famous for its series of 28 stained-glass windows. Keble was a native. Population of Parish, 1,525.

FAIRHAVEN, a manufacturing town of Vermont, about nine miles northeast of Whitehall, N. Y. It contains extensive quarries and manufactories of marble and slate. Pop. (1890), 2,791.

FAIRHAVEN, a village of Bristol county, Mass., on the east side of New Bedford harbor, 60 miles south of Boston. The harbor is good and the town manufactures ships' furnaces, tacks, metallic wares and castings. Population (1890), 2,919.

FAIR HEAD, or BENMORE, a precipitous promontory of the north coast of Antrim, Ireland, opposite Rathlin Isle, four miles to the northwest. It rises 636 feet above the sea, and consists of carboniferous strata, overlaid by greenstone columns, 20 to 30 feet thick, and 280 to 300 feet high.

FAIR ISLE, a solitary island in the Atlantic, 25 miles from Shetland. It is four by two and one-half miles in extent, and rises 708 feet above the sea, with high rocky cliffs and promontories. The population, chiefly fishers, is 226.

FAIRMONT, the county-seat of Marion county, W. Va., situated at the head of navigation on the Monongahela River. It contains a State normal school, shops and mills, and there are coal mines in the vicinity.

FAIR OAKS, near Chickahominy, Va., the scene of a battle fought May 31 and June 1, 1862, between the Union forces under Gen. McClellan and the Confederates under Gen. Johnston, in which the latter were forced to retreat with a loss of about 8,000, the Federal army having lost nearly 6,000.

FAIRPLAY, the county-seat of Pike county, Col., at the head of South Park, 117 miles from Denver. It is at an altitude of 9,964 feet above sea level, and is the point whence Mount Lincoln mining district derives its supplies.

FAIRPORT, a village of Monroe county, N. Y., 11 miles east of Rochester. It has manufactories of cream of tartar, baking-powder, flour, saleratus, barrels, staves, carriages, confectionery, canned goods, etc. Population (1890), 2,552.

FAIRVILLE, a village of St. John county, N. B., on St. John River, 2½ miles from St. John. It contains the New Brunswick Lunatic Asylum.

FAITH. See Britannica, Vol. III, pp. 532-35; also Vol. XXIII, p. 264.

FAITH-CURE, or FAITH-HEALING, the treatment of sickness by prayer, and the exercise of faith in God, without medical advice or appliances. Dorothea Trudel, at Männedorf, Switzerland, between 1850 and 1860, wrought many cures by faith and prayer; but the recent movement in favor of faith-healing, which is conspicuous in Sweden and in the United States, is the outcome of the success of Pastor Blumhardt, at Müttlingen in Würtemberg, and afterwards at Boll, near Göppingen. There are homes for faith-healing at various places in Great Britain and in the United States.

FAITH, RULE OF, that which faith adopts as its guide. The Bible, in Protestant churches, is accepted as the sole rule of faith. In the Roman Catholic church the rule of faith is the body of revealed truth contained in the Scriptures and traditions.

FAITHFULL, EMILY, an English philanthropist, born at Headley rectory, Surrey, in 1835, educated at Kensington, and in early life devoted herself to ameliorating the condition of working-women, and extending their sphere of labor. She learned the art of type-setting, and in 1860 established a printing-office where only female compositors were employed. The project was approved by Queen Victoria, and the business was styled the Victoria Press. The publication of a handsome book entitled *Victoria Regia*, and dedicated by permission to the queen, led to Miss Faithfull's appointment as publisher in ordinary to Her Majesty. In 1863 the "Victoria Magazine, a publication devoted to the rights of women, was commenced. Miss Faithfull has won a high reputation as a lecturer on her favorite topic, not only in England, but in the United States, which she has twice visited. She is author of *Change Upon Change* (1868), *A Reed Shaken With the Wind* (1873), and a number of other works. In 1889 she was awarded a civil-list pension of fifty pounds.

FAIZPUR, a town of Bombay presidency, about 200 miles east of Surat, with a reputation for its dark-blue and red dyes and cotton prints. Population, 9,640.

FALCKENSTEIN, VON EDUARD V., born in Silesia in 1797, a Russian general who distinguished himself at the battles of Katzbach and Montmirail, when only 17, and afterwards served in the campaign of Holstein, and in the wars of 1866.

FALCON. See Britannica, Vol. IX, pp. 2-4.

FALCONER, THE HON. ION KEITH (1856-87), orientalist, missionary, and athlete, born in Edinburgh, July 5, 1856. From Harrow he went to Cambridge, and there he began evangelistic work. In London he aided by personal effort in founding an assembly hall, to which he contributed \$10,000. A keen cyclist, he defeated in 1878 the fastest rider in the world, and rode from Land's End to John O'Groats. He was author of the article "Short-hand," in the *ENCYCLOPEDIA BRITANNICA*. He had accepted the Lord Almoner's professorship of Arabic at Cambridge, and was settled at Shaikh Othman, near Aden, as a missionary, when his promising career was cut short by fever, May 10, 1887.

FALCONET, a name used in the 15th and 16th centuries for a small field-gun. The ball weighed from one to two pounds; and the gun from five to fifteen hundred weight.

FALCONIDÆ, a large family of birds of prey. The muscular strength and power of flight; the habit of preying upon living animals, and that in daylight; the world-wide representation by over 300 species, are to be noted. The beak is rather short, but very strong, and highest at the root; the partition between the nostrils is complete; the upper margin of the eye-socket projects; the feet bear strong, sharp, rending claws and large solepads. The family includes the falcons *par excellence*; the eagles; the buzzards; the kites; the hawks; the harriers; and the caracaras.

FALDSTOOL, a small desk in churches in England, at which the litany should be sung or said. The name is also given to a folding stool used by Roman Catholic bishops and other prelates on certain occasions.

FALEME, one of the most important tributaries of the Senegal. It rises in Futa-Jallon, flows north and joins the main stream above Bakel. About 120 miles above its mouth the Faleme is interrupted by rapids and waterfalls. Up to that point it is navigable for small steamers during two months of the year.

FALERNIAN WINE, one of the favorite wines of the Romans. It is described by Horace as surpassing all other wines then in repute; but in the time of Pliny Falernian wine had begun to decline in quality.

FALK, PAUL LUDWIG ADALBERT, German jurist and statesman, born at Metshkau in Silesia, Aug. 10, 1827, and educated at the gymnasium and University of Breslau. He began his legal career in 1847, and in 1862 became counselor of the court of appeals at Glogau, and on the formation of the North German Confederation in 1867 was elected representative of Glogau. In 1868 he was assigned as privy counselor to the ministry of justice, and was employed in the codification of the laws of the German Empire. Made a representative of Prussia in the imperial council, Dr. Falk was minister of public worship and instruction in 1872, when Prince Bismarck decided on curtailing the privileges of the Roman Catholic church, and it was he who brought forward the repressive measures (see *Britannica*, Vol. X, p. 513). It was through the agitation caused by the passage and attempt to enforce these laws that Dr. Falk's name became widely known. When negotiations were begun for the restoration of harmony between church and state he retired from office. A peerage was offered to him, which he accepted for his son. In 1882 he was appointed to the presidency of the court at Hamm.

FALKLAND ISLANDS, otherwise called *Les Îles Malouines*, a British colony in the South Atlantic. For history and earlier statistics, see *Britan-*

nica, Vol. IX, pp. 14-16. South Georgia, an island 800 miles east-southeast, has been annexed to the colony. Its area is 1,570 square miles, but it is snow-covered, sterile, and uninhabited. The present area of the Falklands is 8,070 square miles, with a total population of 1,890. The chief town is Stanley, with a population of 700. The government is administered by the governor, assisted by an executive council and a legislative council. There were in 1889 two government schools, with 142 pupils; one private school with 71 pupils, and one school at Darwin with 22 pupils. There are no naval or military forces. The total revenue for 1889 was £8,628; expenditures, £9,720; imports, £55,716; and exports, £116,102. Sheep-farming is the chief industry, 2,325,154 acres being devoted to sheep pasturage. In 1887 there were in the colony 2,173 horses, 8,169 cattle, and 582,410 sheep.

FALL, the name applied in theology to the change of state with respect to sin which befell Adam and Eve in Eden. The Fall was due to an external temptation offered by the devil, and sin and a corrupted nature are the inheritance through the first sinners of all their natural descendants.

FALLACY, the incorrect performance of the process of reasoning so as to lead to error. The science of logic reduces sound reasoning to certain rules, and when any of these rules are violated a logical fallacy is the result. The time-honored division was into two classes, according as the error lay in the *form* of the reasoning or in the *matter*; the formal were entitled *in dictione*, or those appearing in the expression; the material were entitled *extra dictionem*, implying that the fault could not be detected from the language, but must be sought in a consideration of the meaning or subject-matter. Other classifications have been carried out, but owing to the variety and intricacy of inaccurate and confused modes of thought it is difficult to draw up a scheme at once complete and rigorously scientific.

FALLS CITY, the county-seat of Richardson county, Neb., in the Great Nemaha Valley, 9 miles west of the Missouri River. It contains flour mills, pork-packing house, a foundry, a broom factory, a windmill factory, and steam elevators. Pop., 2,102.

FALLING BODIES. All bodies, no matter how unequal in weight, fall in the same time *in vacuo*, from any given height. It is the resistance of the atmosphere only which causes the difference of time in descent, the descent itself being caused by gravity. Experiment has proved that a body moving freely through space falls 16.1 feet a second, and that, continuing its course, it would during the next second pass through a space of 32.2 feet, which is the measure of the accelerating force of gravity.

FALLOUX, ALFRED PIERRE, Comte de, French statesman, born at Angers, May 7, 1811, died Jan. 7, 1886. He first became known by his *Histoire de Louis XVI* (1840), a Legitimist work; and *Histoire de Pie V* (1844). As a Legitimist he was elected to the chamber of deputies in 1846. He recognized the Republic in 1848, and became a member of the Constituent Assembly, and when Louis Napoleon was elected president, was made minister of public instruction. He retired from public life in 1851, became one of the editors of the "Correspondent" in 1855, was admitted to the French Academy in 1856. Among his later works are: *Madame Swetchine, sa Vie et ses Œuvres* (1859); *Dix Ans d'Agriculture* (1863); and *Questions Monarchiques* (1873). He also edited a collection of the letters of Madame Swetchine (1866).

FALLOWS, SAMUEL, an American Reformed Episcopal church bishop, born in 1835. In 1859 he became vice-president of Gainesville, Wis. University, and in 1861 was ordained in the Methodist Episcopal church. He served in the civil war, and was brevetted brigadier-general. Later he was a pastor in Milwaukee, and in 1871 became State superintendent of public instruction for Wisconsin, twice receiving a reelection. In 1874 he became president of the Illinois Wesleyan University. In 1875 he was made rector of St. Paul's Reformed Episcopal church, Chicago, and the following year became editor of the "Appeal," the organ of the Reformed Episcopal church. In July of the same year he was chosen bishop. From 1864 to 1874 he was regent of the University of Wisconsin.

FALL RIVER, a city of Massachusetts (see Britannica, Vol. IX, p. 16). Fall River has now become the greatest cotton manufacturing center in America. In 1891 the number of cotton manufacturing companies was 40, owning 65 mills, with an incorporated capital of \$20,643,000, and a probable investment of \$40,000,000. These mills contained 2,128,228 spindles, which is nearly one-sixth of all the spindles in the country, and about one-fifth of all in New England. The mills contain 49,586 looms, and manufacture three-fifths of all American print cloths. The bleaching and dyeing of cotton goods is carried on extensively, as is also the printing of calicoes. The streets of the city are broad, well shaded and paved, and lighted with both gas and electricity. The United States Custom-house and postoffice building is one of the finest Government buildings in the country. It is built of gray rock-faced ashlar, with trimmings of red and gray granite, and was completed in 1880. The city hall is also a fine building. The city is well supplied with excellent schools. The city annually appropriates \$175,000 for the support of the high school, which has English, classical, and mixed courses. The Durfee High School building was donated to the city in 1887, and is a stately granite structure, thoroughly equipped, with astronomical observatory, and chemical and philosophical apparatus. A free public library contains 36,000 volumes. Population in 1880, 47,883; in 1890, 74,351.

FALLS OF MONTMORENCY, a cataract of 250 feet, where the Montmorency River empties into the St. Lawrence, near Quebec, Can. Singular ice cones form here in winter.

FALMOUTH, a seaside resort of Barnstable county, Mass., at the west end of Cape Cod, on Buzzard's Bay. Population, 2,567.

FALSE BAY, an inlet of the Atlantic in Cape Colony, Africa, its west side being formed by the Cape of Good Hope. It is about 22 miles in length and breadth. It is a station of the Cape naval squadron.

FALSETTO, a term in singing for the highest register of a man's voice, which joins the natural or chest-voice, and which, by practice, may be so blended with the chest-voice as to make no perceptible break.

FALSIFYING RECORDS. Injuring or falsifying any of the documents of a court of justice is, by several statutes, made a serious offense. Any person obliterating, injuring, or destroying any record, writ, etc., or any original document belonging to any court of record or of equity, is guilty of felony, and is liable to be punished by two years' imprisonment, with or without hard labor.

FALUNS, a term given by the agriculturists of Touraine to shelly sand and marl, which they use as manure, and applied by geologists to the deposits from which they are obtained.

FAMA, the goddess of rumor, a personification which appears in the works of the earliest poets. Sophocles makes her the child of Hope; Virgil, the youngest daughter of Terra, and sister of Enceladus and Coeus.

FAMA CLAMOSA: in the ecclesiastical law of Scotland, a widespread and prevailing report imputing immoral conduct to a minister, probationer, or elder of the church.

FAMILIAR, or **FAMILIAR SPIRIT**, a supernatural being in attendance upon a magician, wizard, or other professor of the black art. The word familiar is probably derived from the Latin *familus* (a domestic, a slave). The belief in such spirits goes far back into the history of the race. We read of them in the time of Moses, who admonishes his countrymen to "regard not them that have familiar spirits" (Lev. xix, 31), which would imply the prevalence of the superstition among the Egyptians.

FAMILY: in zoölogical classification, an alliance of nearly related genera.

FAMINE PORT, an abortive settlement of Spain on the northern side of the Strait of Magellan. It owes its name to the death, by starvation, of the Spanish garrison.

FANARIOTS, the general name given to the Greeks inhabiting the Fanar, or Fanal, in Constantinople. They first appear in history after the taking of Constantinople by the Turks.

FANDANGO, an old Spanish national dance in 3-time. It is danced most gracefully in the south country, usually to the accompaniment of a guitar, while the dancers beat time with castanets. It proceeds gradually from a slow and uniform to the liveliest motion, and expresses vividly all the gradations of the passion of love.

FANEUIL, PETER (1700-43), an American merchant. In 1742 he built at his own cost, as a gift to Boston, Mass., a public market-house. This building was destroyed by fire in 1761, but was rebuilt in 1763, and in 1775 was used as a theater. During the Revolutionary period it was the usual meeting-place of the patriots, and gained the name of "the cradle of American Liberty."

FANFARE, the French name of a 'short and lively military call executed on brass instruments. It was first introduced by the Arabs.

FANG: in the technical terminology of the law of Scotland, a thief taken *with the fang* is one apprehended while carrying stolen goods on his person. The fangs of a dog or of a serpent are its teeth with which it catches or holds.

FANINO FAVENTINO, a Protestant martyr of Italy, who, being arrested at Bagna Cavallo in 1548, was visited in prison by many distinguished Italians. Pope Julius III condemned him to the stake. He was strangled and his body burned in 1550.

FANNER, a machine employed to winnow grain, driven by hand or other power. In passing through the machine the grain is rapidly agitated in a sieve, and as it falls through a strong current of wind, created by a rotary fan, the chaff is blown out at one end, while the cleansed particles fall through an orifice beneath.

FANNING, a coral island in the Pacific, lying in 3° 51' N. lat. and 159° 22' W. long. It has about 150 inhabitants, and was formally annexed by Britain in 1888, as lying in the path of a possible submarine cable between Canada and Australia. Fanning Island is also called American Island. The name of Fanning Islands is sometimes given to the group comprising Fanning, Christmas, New York or Washington, Jarvis, and Palmyra Islands.

FANNING, EDMUND, born in Long Island in 1737, died in London, England, 1818. He was graduated at Yale in 1757, and practiced law in Hillsborough, N. C. He also became recorder of deeds, and was a stern Loyalist, who treated all opposition to authority with extreme severity. Governor Tryon was his father-in-law, and, in 1771, when the people rose en masse against his authority, he followed Governor Tryon to New York city as his private secretary. In 1777 he organized a corps called the "King's American Regiment." Later he went to Nova Scotia, where, in 1783, he became councillor and lieutenant-governor; in 1786 he was governor of Prince Edward Island.

FAN-TRACERY VAULTING, a kind of Late Gothic vaulting (15th and 16th centuries), so called from its resemblance to a fan. The ribs or veins spring from one point, the cap of the vaulting shaft, and radiate with the same curvature, and at equal intervals, round the surface of an inverted curved cone or polygon, till they reach the semi-circular or polygonal ribs which bound the upper part of the cone and divide the roof horizontally at the ridge level into diamond and other patterns. The spaces between the ribs are filled with foils and cusps, resembling the tracery of a Gothic window; hence the name *fan-tracery*.

FARADIZATION: in medicine, the application of Faradic or inductive electricity to the animal frame. It is named after Faraday.

FAREWELL, CAPE, the southern extremity of Greenland. It is generally beset with ice, which appears to come from the northeast, and sweep around into Davis Strait. It lies in latitude 59° 49' north, and longitude 43° 54' west.

FARGO, a city and county-seat of Cass county, North Dakota, at the head of navigation on the Red River of the North, opposite Moorehead, Minn. It is a great wheat market, has the largest farm-machinery depot in the northwest, contains a Presbyterian seminary, Roman Catholic academy, Congregational College, and is furnished with water works, gas and electric lights, and a telephone system. Population (1890), 5,664.

FARIBAULT, a city and county-seat of Rice county, Minn., at the confluence of the Straight and Cannon Rivers. It contains a number of manufactories, a State asylum for the deaf, dumb and blind, an Episcopal divinity college, and five seminaries. Population (1890), 6,520.

FARISAN ARCHIPELAGO, a group of islands in the southeast of the Red Sea, the chief of which are Farsan Kebeer, 31 miles long, and Farsan Seggeer, 18 miles long. In latitude 16° 30' north, and longitude 41° 45' to 42° 10' east.

FARJEON, BENJAMIN LEOPOLD, born in London, England, of Jewish parentage, May 12, 1833. He spent some years in New Zealand, and in 1869 returned to London, where he issued several novels, of which *Blade o' Grass* and *London's Heart* are best known. In 1877 he married a daughter of Joseph Jefferson.

FARM, a tract of land, consisting usually of grass lands, meadow, pasture, tillage and woodland, devoted to agricultural pursuits, and under the management of the owner, or a tenant. In the United States, with a land area of 1,900,800,000 acres, in 1880 there were 4,008,907 farms, with a total farming area of 536,081,835 acres. Of this area 284,771,042 acres was improved land, and 251,310,773 unimproved thus giving an average of 71 acres of improved and 62 acres of unimproved land to each farm. In 1880 the value of the total improved farming land of the United States was \$10,197,096,776; the value of farming implements and machinery \$406,520,055; and the value of farm

products of 1879, \$2,213,402,564. The census of 1880 showed the increase in the number of acres of improved land to be 52 per cent of the improved land of 1870; the increase in the value of farms to be 30.7 per cent; and the increase in the value of implements to be 52 per cent.

AVERAGE YIELDS AND VALUES OF FARM CROPS FOR TEN YEARS.—An examination of the report of the statistician of the U. S. Agricultural Department, bearing date June 16, 1890, shows a wide range in both yield and value per acre during the last decade. Tobacco has the highest average, \$61.51. That of potatoes is \$38.34. Cotton, the third in order, drops to \$15.69. Hay makes an average of \$11.08. The cereals fall below \$10 per acre, excepting only barley, which is not grown in sufficient quantities to meet the requirements of consumption, and averages \$12.76 per acre; 28 per cent more than the average of wheat for the same period. The average for corn is \$9.47; that of rye, \$8.27; of buckwheat, \$8.24; and of oats, \$8.16.

The cost of cultivating and harvesting tobacco and potatoes is considerable, yet the opportunity for larger net returns for superintendency and use of land is greater in the case of large gross returns per acre. Considering the cost of picking and ginning, as well as the labor of cultivation, the value of cotton per acre is not greatly in excess of that of cereals. The value of cereals suggests an excess of breadth cultivated and a minimum of labor in cultivation, which account for the low yields and small net profits. It indicates the fact that the era of extensive culture awaits the scarcity and appreciating value of fresh lands. The extremes in value per acre of corn are \$24.32 and \$6.19. Eighteen States and Territories averaged above \$15. Half of these are east of the Alleghanies and north of Delaware; the other half on the Pacific coast and in the Rocky Mountain region. In the former the cause is found in large yield and high prices, both the result of demand for consumption by a large proportion of the population engaged in non-agricultural industries. In the latter the climate is not so well suited to maize, and mining and manufacturing stimulate demand. Where prices are lowest there is either an excessive production or a very low rate of yield. It requires nearly four acres in South Carolina to equal the value of one in New Hampshire, and it requires more than three acres in Nebraska, which makes the highest average rate of yield, to produce the value of one in the Granite State. These diverse results depend far more upon inequalities in distribution of population, and especially in the ratio of consumers to producers, than upon climate or soil. In wheat and other cereals, potatoes, hay, and all farm products of general geographical distribution, similar differences are found to result from similar causes.

The tabulation of rate of yield per acre makes the following averages for 10 years, which are stated in connection with averages of value per acre:

Yearly Productions.	Value.	Yield.
Corn, bushels	\$9.47	24.1
Wheat, "	9.95	12.0
Oats, "	8.16	26.6
Rye, "	8.27	11.9
Barley, "	12.76	21.7
Buckwheat, "	8.24	12.8
Potatoes, "	38.34	76.2
Tobacco, pounds	61.51	727.1
Cotton, "	15.69	168.1
Hay, tons	11.08	1.19

The past decade has been marked by several years of drought, which have reduced the rate of yield below the average of the preceding decade, a period comparatively exempt from dry seasons. The years of sufficient rainfall show no diminution of rate of yield.

The tables following show the average yield and value per acre by States of the various farm crops for a period of 10 years, 1880 to 1890, inclusive.

See AGRICULTURE, in these Revisions and Additions. Also see Britannica, Vol. I, pp. 219-416.

FARMINGTON, a village of Hartford county, Conn., on Farmington River. It has important manufactories, and a population of 3,179.

FARMINGTON, the county-seat of Franklin county, Me. It contains a State normal school, other excellent schools, machine shops, saw, shingle and clapboard mills, a drum factory, a spool factory. Population, 1,243.

FARMINGTON, a village of Dakota county, Minn., containing a flouring-mill, and shoe and carriage manufactories. It has a large wheat elevator and is located in a wheat growing region.

FARMINGTON, a village of Stafford county, N. H. It has a high school and manufactories of lumber. Population (1890), 3,064.

FARMVILLE, the county-seat of Prince Edward county, Va., on the Appomattox River, 70 miles southwest of Richmond. The tobacco trade is the principal business and the place contains tobacco factories, and a female college. Hampden-Sydney College and the Union Theological Seminary are located seven miles distant. Population, 2,404.

FARNHAM, ELIZA WOODSON (1815-64), an American philanthropist, wife of Thomas Jefferson Farnham. In 1844 she became matron of the New York State-prison at Sing Sing, and in 1848 became connected with the management of the institution for the blind at Boston. From 1849 to 1856 she was in California, and in 1859 organized a society in New York to assist destitute women to find homes in the West. Subsequently she re-

turned to California. She wrote several books about her experiences in the West.

FARNHAM, THOMAS JEFFERSON (1804-48), an American author. In 1839 he organized and took charge of a small expedition across the continent from Vermont. While in California he obtained the release of a large number of American and English citizens, who had been imprisoned by the Mexican government. He was the author of several works concerning his travels.

FARO, or PHARO, a game at cards, played chiefly by professional gamblers.

FARMERS-GENERAL (*Fr. fermiers généraux*), the name given to a privileged association in France, which flourished previous to the revolution of 1789. The members were granted the privilege of collecting the taxes on certain branches of the revenues of the nation. This system of tax-gathering became general in France from the year 1546, when Francis I let out the *gabelle* or salt-tax in this way. The privileges of the position were sold to the highest bidder; but they were largely in the hands of the king's favorites. The powers, rights, and duties of the class were defined by special decrees; but, however severe may have been the fiscal laws against fraud and contraband, it is notorious that shortly before the revolution abuses of the most flagrant description had demoralized the system and the men. During the revolution most of these obnoxious tax-gatherers perished on the scaffold, the innocent among them being oc-

asionally confounded with the guilty. About thirty farmers-general were executed in 1794. Farmers of the revenue were also an institution of ancient Rome. Tolls on roads and duties of various kinds were at one time farmed also in Great Britain.

FARMERS' ORGANIZATIONS. The earliest of the great farmers' organizations was that of the Patrons of Industry, a secret order, with ritual and "degrees of work" suggested by those of the Masonic and Odd Fellows fraternities. The scheme was devised and formulated and publicly announced Aug. 5, 1867, by William Saunders, then Superintendent of the United States Government Gardens and Conservatories in Washington, D. C. Associated with Mr. Saunders (who up to that date had not been connected with any secret society), were O. H. Kelley, J. R. Thompson, and William H. Ireland, members of the Masonic fraternity; Rev. A. B. Grosh, an influential officer of the Odd Fellows; and Rev. John Trimble, Jr., all connected with the Government departments in Washington. A week later Mr. Saunders, having occasion to visit Western New York, Ohio, and other Western States, took with him the ritual and plan of "work" under the first degree which had been formulated in Washington, and interested five others in the work. Later in the autumn the work of the 2d, 3d, and 4th degrees was formulated, and the name Patrons of Industry given to the order. On Dec. 4, 1867, at the office of Mr. Saunders, in Washington, D. C., nine persons who had taken the four degrees met and organized the National Grange, with the following officers: W. Saunders, Master; J. R. Thompson, Lecturer; A. Bartlett, Overseer; William Meier, Steward; A. S. Moss, Assistant Steward; Rev. A. B. Grosh, Chaplain; W. M. Ireland, Treasurer; O. H. Kelley, Secretary, and E. P. Ferris, Gate-Keeper. The constitution provided for the admission of women to membership, and also for the election of four ladies as officers, to be designated Ceres, Pomona, Flora, and Lady Assistant Steward. A little later a subordinate lodge of 60 members was organized, and on January, 1868, the first circulars to prominent agriculturists were sent out in all directions. The chief objects were stated to be "the promotion of unity and coöperation among the tillers of the soil and the diffusion of a higher measure of intelligence and culture." The introduction of political and religious questions into the discussions of the Grange was forbidden. April 1, 1868, Secretary Kelley resigned his clerkship in the Postoffice Department, and on a salary of \$2,000 began a tour for the establishment of subordinate granges. Seven years later there were reported about 22,000 granges, with a membership reaching up into hundreds of thousands. During the year 1888 over 200 Granges were added, a year later the membership, including men and women, was reported at over half a million; and in 1890 the subordinate granges at about 26,000. The subordinate grange is composed of persons engaged in agriculture who are over fourteen years old, and of both sexes, women being recognized as the equal of man throughout the order. The masters (and their wives) of the subordinate granges constitute the State Grange, at which the other members of the local bodies have the right to participate except in voting. The masters (and their wives) of the State Granges constitute the National Grange, at which all members may also be heard. District or county (also called Pomona) granges may be formed by the union of neighboring clubs. The local body meets one to four times a month; the district grange monthly or quarterly; and the State and National bodies annually. The Grange thus brings the farmer and his family in

close communion with his contemporaries in town, county, State, and Nation, so that all may work together when desired. The laws governing the order in essential matters originate in the National Grange, from which also emanate the charters of all local, county or State Granges. The income is from the initiation fees of \$3 for men and \$1 for women. The specific aims of the Grange are set forth in the "Declaration of Purposes," as follows:

"To create a better and higher manhood and womanhood among ourselves. To enhance the comforts and attractions of our homes, and strengthen our attachments to our pursuits. To foster mutual understanding and coöperation. To maintain inviolate our laws, and to emulate each other in labor, to hasten the good time coming. To reduce our expenses both individual and corporate. To buy less and produce more, in order to make our farms self-sustaining. To diversify our crops, and crop no more than we can cultivate. To condense the weight of our exports, selling less in the bushel and more on hoof and in fleece; less in lint, and more in warp and woof. To systematize our work, and calculate intelligently on probabilities. To discountenance the credit system, the mortgage system, the fashion system, and every other system tending to prodigality and bankruptcy.

"We propose meeting together, talking together, working together, buying together, selling together and, in general, acting together for our mutual protection and advancement as occasion may require. We shall avoid litigation as much as possible by arbitration in the Grange. We shall constantly strive to secure entire harmony, good will, vital brotherhood among ourselves, and to make our order perpetual. We shall earnestly endeavor to suppress personal, local, sectional, and national prejudices, all unhealthy rivalry, all selfish ambition. Faithful adherence to these principles will insure our mental, moral, social, and material advancement."

The first Farmers' Alliance was organized in Texas in 1873, for the purpose of coöperation against cattle thieves; but as it increased in numbers its scope was extended, and in 1880 it was chartered by the State of Texas as a benevolent institution. In 1887 it had reached a membership of over 100,000, and then united with the Farmers' Union of Louisiana, which reported a membership of 10,000; and these two bodies thus consolidated were incorporated under the laws of the District of Columbia as a national trades-union, in the name of "The National Farmers' Alliance and Coöperative Union." About the date of the Texas organization (1873), another Farmers' Alliance was organized in the State of New York, and spread westward as a non-secret order, and became a strong body north of the Ohio River and west of Pennsylvania. The National Agricultural Wheel, a league, or guild, similar in scope and aims to those of the Grange, was founded in Prairie county, Arkansas, in 1880, and soon reported numerous branches and a large membership in the Southwest.

Other important organizations are the Farmers' Mutual Benefit Association, which claims to have a half million members, mostly in the Western States; the National Farmers' League, mainly an Eastern association; the Patrons of Industry, with headquarters in Michigan and membership in that and adjacent States; the National Colored Farmers' Alliance and Coöperative Union, composed of negroes, and naturally strongest in the Southern States; the National Farmers' Alliance, which was organized in Chicago in 1880, and is composed of State Alliances in fifteen States, with societies in

others, and is familiarly termed the "North-Western Alliance," and the National Farmers' Alliance and Industrial Union. In some of the States these societies not only overlap each other, but also are heartily at work for a common object.

The National Farmers' Alliance and Industrial Union is the outcome of the union consummated in St. Louis, Mo., Oct. 1, 1889, between the National Farmers' Alliance and Cooperative Union and the National Agricultural Wheel, and the new name was given to the united societies at the annual meeting held in that place on that date. The new society thus created was then credited with a total membership estimated at from 1,600,000 to 2,500,000.

THE NATIONAL FARMERS' POLITICAL LEAGUE is a non-secret, independent, non-partisan organization, in harmony with the Alliance, Farmers' Union, Grange, and kindred associations, agricultural societies, farmers' clubs, and similar organizations. But the League goes a step further. Its object is to be "the farmers' political welfare. The work of the League is directed toward securing a just representation and treatment of the agricultural interests in Congress and in the Legislatures, and due recognition of farmers in all public affairs, without conflicting with the best interests of the entire people." It consists of a National League and of State leagues, with county and town leagues. The National League has general supervision of the affairs of the Farmers' League and the work of organization, and attends specially to the farmers' interests in Congress. The State leagues, as soon as organized, push the work of organization in their respective States, and attend to the farmers' special interests in the Legislature. The County League attends to the farmers' interests in county matters, and to affairs in Senatorial and Representative districts. The town leagues furnish the delegates who constitute the county leagues and attend to the farmers' interests in local districts, and in each election precinct.

The next annual meeting of the National Farmers' Alliance and Industrial Union was held in Ocala, Ga., during the first week in December, 1890. It was composed of 136 delegates from 35 States and Territories. After extended discussion it adopted the following resolutions:

First—We demand the abolition of national banks. We demand that the Government shall establish sub-treasuries or depositories in the several States which shall loan money direct to the people at a low rate of interest, not to exceed two per cent, per annum on non-perishable farm products, and also upon real estate with proper limitations upon the quantity of land and amount of money. We demand that the amount of the circulating medium be speedily increased to not less than \$50 per capita.

Second—We demand that Congress shall pass such laws as shall effectually prevent the dealing in future on all agricultural and mechanical productions; preserving a stringent system of procedure in trials such as shall secure the prompt conviction and the imposition of such penalties as shall secure the most perfect compliance with the law.

Third—We condemn the Silver bill recently passed by Congress, and demand in lieu thereof the free and unlimited coinage of silver.

Fourth—We demand the passage of laws prohibiting alien ownership of land, and that Congress take prompt action to devise some plan to obtain all lands now owned by aliens and foreign syndicates, and that all lands now held by railroads and other corporations in excess of such as is a tually used and needed by them be reclaimed by the government and held for actual settlers only.

Fifth—Believing in the doctrine of equal rights to all and special privileges to none, we demand that our national legislation shall be so framed in the future as not to build up one industry at the expense of another, and we further demand a removal of the existing heavy tariff tax from the necessities of life that the poor of our land must have. We

further demand a just and equitable system of graduated tax on incomes. We believe that the money of the country should be kept, as much as possible, in the hands of the people; and hence, we demand that all National and State revenues shall be limited to the necessary expenses of the Government economically, and honestly administered.

Sixth—We demand the most rigid, honest, and just State and National governmental control and supervision of the means of public communication and transportation; and if this control and supervision does not remove the abuses now existing, we demand Government ownership of such means of communication and transportation.

The officers elected for the ensuing year were as follows: President, L. L. Polk, of North Carolina; Vice-President, B. F. Clover, of Kansas; Secretary, J. H. Turner, of Georgia; National Lecturer, J. S. Willetts, of Kansas; Chairman Executive Committee, C. W. Macune, of Texas.

At the annual meeting in Ocala, articles of union were adopted by which the Farmers' Mutual Benefit Society, embracing a membership of about 500,000 members in Illinois, Indiana, Iowa and adjacent States, was to be merged in the National Farmers' Alliance and Industrial Union. The Colored Farmers' Alliance, claiming a membership of about 1,200,000, under the superintendency of Col. R. M. Humphrey, a white man, and formerly a preacher in Texas, was also represented at the Ocala meeting, and a basis of union with the National Farmers' Alliance was agreed to, to go into effect a year hence. The agreement embraced the following provisions, which were to apply also to the Farmers' Mutual Benefit Association:

"We recommend the selection of five men from each national body, two of whom shall be the president and secretary, who shall, with a similar committee from other labor organizations, form a supreme executive board, who shall meet as often as may be deemed necessary upon the joint call of a majority. The presidents of the bodies joining this confederation shall be empowered to do such things for the mutual benefit of the various orders as shall be deemed expedient, and shall, when officially promulgated through the national officers, be binding upon such bodies until reversed by the action of the national assemblies themselves in matters political, educational, and commercial; and we hereby pledge ourselves to stand faithfully by each other in the great battle for the enfranchisement of the laborer from the control of corporate and political rings.

"Each order is to bear its own members' expenses to the Supreme Council, and be entitled to as many votes as it has legal voters. We commend and urge that equal facilities, educational, commercial, and political, be demanded for colored and white Alliance men alike, competency considered, and that a free ballot and a fair count be insisted upon and had for colored and white alike by every true Alliance man in America.

"We further recommend that the plan of district alliances conforming to Congressional district lines be adopted by every order, and that the lecturers and officers of said districts and counties cooperate with each other in educational, commercial, and political matters."

One of the most remarkable features of the meeting at Ocala was the development of feeling in favor of an independent political party movement—a movement which would be likely to engage the attention and sympathy of all the various farmers' organizations, and at the same time be sufficiently unrestricted in its membership to open its doors to such "honest persons" as are shut out from membership in most, if not all, the other farmers' societies. There was already at hand an organization which seemed adapted to meet the want indicated. Nearly a year previous the *Citizens' Alliance* was started in Kansas, and had already a large membership in that State, and in Nebraska and Iowa. A national organization was perfected at Ocala, and the following officers were chosen: President, J. D. Holden, of Kansas; secretary, Ralph Beaumont, of New York; treasurer, L. P. Wild, of Washington, D. C.

The annual salaries of the officers of the national organization are fixed by the statutory laws as follows: President, \$3,000, office and traveling expen-

ses, and \$900 for stenographer; secretary, \$2,000 and office expenses; treasurer, \$500; lecturer, \$2,000 and actual traveling expenses; members of the executive committee, \$500 each and traveling expenses when in actual service, except that the chairman shall have \$2,000. A per capita tax of five per cent. on members must be paid into the national treasury annually to defray expenses.

The declaration of principles stated that "the organization is formed for the purpose of cooperating with the Farmers' Alliance, the Knights of Labor, and other orders, in the support of the St. Louis platform (which embraced largely the same items adopted at Ocala) 'and to this end the organization is political in its nature.'" The officers included those mentioned and an executive committee of one from each State and Territory, with headquarters in Washington, D. C. Charters were to be furnished to subordinate bodies on application of five or more citizens. Local organizations were to judge of the qualification of their members. It was declared that the present national organization is temporary, and that as soon as the order is organized in a majority of the States, a national convention shall be held to revise it. Subsequently the following call was issued at Ocala:

Whereas, In unity there is strength; therefore, it is desirable that there should be a union of all the variously named organizations that stand on common ground.

To this end the individuals from various States, whose names are hereto signed, make this call for a National Conference, to be composed of delegates from the following organizations, namely:

The Independent Party, the People's Party, the Union Labor Party, the late Federal and Confederate soldiers, the Farmers' Alliance, the Farmers' Mutual Benefit Association, the Citizen's Alliance, the Knights of Labor, the Colored Farmers' Alliance, and all other industrial organizations that support the principles of the St. Louis agreement of December, 1889. Each State organization to send one delegate from each Congress district, and two from the State at large; and each district organization to send not less than three delegates, and each county organization not less than one delegate to be chosen according to the custom of each respective organization during the month of January, 1891; also that the editor of each newspaper is hereby invited as a delegate that has advocated the principles of the St. Louis agreement and supported the candidates nominated thereon in 1890.

This confederation of parties met in its first annual convention as the People's Party at Omaha, July 2, 1892. On the 4th of July it adopted a platform in which it declared for a union of labor forces, free coinage of silver, increase of the circulating medium, a graduated income tax, government ownership of the telegraph and telephone, reclamation of lands from aliens, the eight-hour law, limitation of the office of president to one term, and opposition to all subsidies to private corporations; its candidates were Gen. James B. Weaver, of Iowa, for president and Gen. James Field, of Virginia, for vice-president. A fusion with other parties was made in some of the States. The People's Party received 1,055,424 popular and 22 electoral votes.

FARQUIER WHITE SULPHUR SPRINGS, in Farquier county, Va., fifty-six miles southwest of Washington, D. C. The place is delightfully situated, and the waters are of much value in certain chronic diseases. The buildings were mostly destroyed during the war.

FARR, WILLIAM, English medical statistician, born at Kenley, Shropshire, Nov. 30, 1807, died in 1883. He studied medicine at the Universities of Paris and London, graduating from University College in 1833, and devoted himself to the study of vital statistics. Through his efforts great improvement was made in the collection of data for that department, the registration of all the deaths in England and their causes was begun, and Dr.

Farr was given a position in the register's office. He was assistant census commissioner of Great Britain from 1851 to 1881, in 1855 was elected Fellow of the Royal Society, and in 1859 received from the University of Oxford the degree of D. C. L. He was a frequent contributor to the *British Annals of Medicine*; and his paper on *The Construction of Life Tables* (1859), his introduction to the *English Life Tables* (1864), and *Statistical Nosology* are of great value.

FARRAR, FREDERICK WILLIAM, D. D., F. R. S., archdeacon of Westminster, born at Bombay, India, Aug. 7, 1831, and educated at Cambridge, where he graduated with the highest classical honors in 1854, and became a Fellow of Trinity College. In 1857 he received the degree of M. A., and was ordained. After some years spent as assistant master at Harrow, he became head master of Marlborough School. In 1873 he was made chaplain in ordinary to the queen, in 1876 canon of Westminster and rector of St. Margaret's, and in 1883 archdeacon of Westminster and rural dean. Canon Farrar is an eloquent preacher and writer, his chief works being *Life of Christ* (1874), *Life of St. Paul* (1879), *The Early Days of Christianity* (1881), *Every-Day Christian Life, or Sermons by the Way* (1887), *Lives of the Fathers* (1888), *Sketches of Church History* (1889). He is also an earnest temperance reformer. He was appointed chaplain of the House of Commons in 1890.

FARRAR, HENRY, an American artist, born in 1843. He first gained distinction for his water-color, and afterwards became noted as a landscape painter. He is a member of various art societies.

FARWELL, CHARLES BENJAMIN, a U. S. Senator from Illinois, born in 1823. He held the office of county clerk of Cook county, Ill., in which county Chicago is situated, eight years, 1853-61; was elected to Congress in 1870 over John Wentworth, and was reelected in 1872 and 1874, after which he declined reelection; was a candidate again in 1880, and was elected, declined further election; was elected to the United States Senate in 1887, to fill a vacancy occasioned by the death of General John A. Logan. His term of service expired March 3, 1891.

FASCES, bundles of rods, usually made of birch, but sometimes of elm, with an axe projecting from the middle of them, which were carried before the chief magistrates of ancient Rome as symbols of their power over life and limb. They were borne by lictors, at first before kings, in the time of the Republic before consuls and prætors, and afterwards before emperors.

FASCIA: in anatomy, a tissue of strong fibrous character, spread out in a layer, which surrounds some muscle or any other special tissue or organ of the body and binds it in place. There are two kinds of fascia, the superficial or subcutaneous and the deep. The superficial fascia is thin and light, and covers the body beneath the skin. The deep fascia are composed of unyielding fibrous substance, which invests the muscles. Fascia are condensed layers of the general connective tissue of the body.

FASCINES, fagots for military purposes made of young branches of trees or brush wood. They are used in the construction of temporary works, for filling a ditch, and sometimes in a pile for setting fire to an obstruction.

FAST AND LOOSE is the name of a game which was much practiced by the gypsies in the time of Shakespeare. The phrase is now often used to designate the conduct of those numerous slippery characters whose code of ethics does not forbid them to say one thing and do another.

FATALISM, the doctrine that all things are subject to fate, or that they take place by inevitable necessity.

FATA MORGANA, a striking kind of mirage observed in the Strait of Messina. A spectator on the shore sees images of men, houses, ships, etc., sometimes in the water, sometimes in the air; the same object having frequently two images, one inverted.

FATHER-LASHER (*Cottus bubalis*), a fish armed with very strong spines on the back of the head and gill-covers. When touched it distends its gill-covers, sets out its spine, and assumes a very threatening appearance. It is brown above, whitish beneath, curiously marbled and spotted. It is said to be a wholesome and agreeable food. In Scotland it is called the *Lucky Proach*.

FATHOM, a measure of six feet, principally used in references to marine soundings and in mines. Originally a fathom was taken as the width to which the two outstretched arms extended.

FATTY DEGENERATION, in pathology, a condition of the animal system, in which the minute structural elements of living organisms are gradually replaced by fat-globules.

FAUCIT, HELEN, an actress, born in 1816, who gained renown on the English stage as Julia, in *The Hunchback*. She was one of Macready's company in his revival of Shakespeare.

FAUGÈRE, ARMAND PROSPER, a French littérateur, born at Bergerac, Dordogne, Feb. 10, 1810, died in 1888. He was for some time employed in the department of public instruction, and subsequently became director of the archives, in the bureau of foreign affairs. He published *Éloge de Blaise Pascal* (1842); *Pensées, Fragments et Lettres de Blaise Pascal*, restored to their original form (1844); *Mémoires de Madame Roland* (1864); and *Fragments de Littérature Morale et Politique* (1865).

FAULKNER, CHARLES JAMES, a U. S. Senator from West Virginia, born in 1847. He accompanied his father, who was minister to France in 1859; attended noted schools in Paris and Switzerland, returned to the United States in 1861, and immediately went south; in 1862, at the age of fifteen, he entered the Virginia Military Institute at Lexington; served with the cadets in the battle of Newmarket; served as aid to Gen. J. C. Breckinridge, and afterwards to Gen. Henry A. Wise, surrendering with him at Appomattox. On his return to Boydville, his home in Martinsburgh, he studied under the direction of his father until October, 1866, when he entered the University of Virginia, graduating in 1868; was admitted to the bar in September of the same year; was made grand-master of the Masonic Grand Lodge in 1879; in 1880 was elected judge of the Thirteenth Judicial Circuit, composed of the counties of Jefferson, Morgan and Berkeley; was elected to the United States Senate as a Democrat, to succeed Johnson N. Camden, in 1887. His term of service expired March, 1893.

FAULKNER'S ISLAND, a small islet in Long Island Sound, off the entrance to the harbor of Guilford, Conn. It has a flashing light with a fog-bell.

FAUNA, a term employed to designate animals collectively, or those of a particular geological period, or those of a particular country, as the fauna of America. The term bears the same relation to the animal kingdom that flora does to the vegetable. Its derivation is from the mythological fauns regarded as the patrons of wild animals. In the fauns of a country are included only those animals which are indigenous to it, and not those which have been introduced.

FAURE, JEAN BAPTISTE, born in 1830, a French baritone of great excellence and reputation; he went on the stage in 1852, and in 1857 became professor at the Paris Conservatoire.

FAUSSE-BRAYE: in fortification, a name given by French engineers to a small mound of earth cast about a rampart. This work has been mostly discarded by modern engineers. The *fausse-braye* had the advantage of giving an additional tier of guns for defensive purposes.

FAUSTINUS I, Emperor of Hayti, born in St. Domingo in 1789, died in 1867. He was originally a negro of very humble circumstances. In the year 1844, when the Haytian Republic was dissolved, a struggle for the supreme power ensued, in which Faustinus played an important part. In 1847 he was appointed president of the Republic. On April 16, 1848, a dreadful massacre of the mulattoes in Port-au-Prince took place at his instigation. This and similar measures struck terror into the hearts of his opponents. In August, 1849, he had himself proclaimed Emperor of Hayti, a title which he enjoyed for about ten years; but a revolution having broken out in 1858, and a Republic having been declared, he was forced to abdicate in 1859.

FAUVETTE, a French name applied to the little song birds of the family *Sylviadæ*, or warblers, having straight slender bills slightly compressed in front, the ridge of the upper mandible curving a little towards the tip, and the legs short. They mostly belong to the genus *Curruca* as the white-throat, or garden warbler, etc., and to the genus *Salicaria*.

FAVIGNANA, the chief of the *Ægades*, a group of islands in the Mediterranean, off the west coast of Sicily. It is six miles in length, and about two miles in breadth, and lies at a distance of six miles from the Sicilian shore.

FAVOSITES, a genus of lamelliferous corals, found in Silurian, Devonian, and Carboniferous strata. They are corals, closely packed together, no space being left between the walls of the different corallites. As in the other Palæozoic corals, the lamellæ are developed in multiples of four, and the older portion of the stony base is partitioned off by horizontal tabulæ.

FAVRE, JULES CLAUDE GABRIEL, a French statesman, born in Lyons, March 21, 1809, died at Versailles, Jan. 20, 1880. He became a prominent lawyer and liberalist in Paris; was for a time secretary-general of the interior in the Republican ministry of 1848; strongly opposed Louis Napoleon during the presidency of the latter, and still more decidedly under the second empire opposed the measures which brought on the Franco-German war, but after its commencement supported the national cause. After the fall of Sedan he became vice-president and minister of foreign affairs in the new Republic, and took an important part in the negotiations preceding the treaty of peace with Germany. He retired from the ministry in July, 1871, and devoted himself to law and literature. In 1876 he was returned as Senator for the department of the Rhone. He was a brilliant orator, and the excellence of his literary productions won him a place in the Academy. He was author of *Rome et la République Française* (1871), and *Le Gouvernement du 4 Septembre* (1871-72).

FAWCETT, HENRY, an English political economist and author, born at Salisbury in 1833, died Nov. 5, 1884. He graduated with honors at Trinity Hall, Cambridge, in 1856, and became a fellow of his hall. Although deprived of his sight by an accident in 1858, he determined to pursue the course which he had previously chosen. In 1863 he became

professor of political economy in the University of Cambridge. Elected to Parliament for Brighton in 1865-74 he was in the latter year returned for Hackney, and in 1880 was made postmaster-general. He was an advanced liberal in politics, advocating election by ballot and woman suffrage. He was author of *A Manual of Political Economy* (1863); *The Economic Position of the British Laborer* (1865); *Pauperism* (1871); a volume of *Speeches* (1873), and *Free Trade and Protection* (1878).

FAWCETT, PHILIPPA GARRETT, daughter of the late Prof. Fawcett, M. P., postmaster-general, born at Cambridge, England, in 1868. She was educated at Clapham High School, at University College, and in 1887 went to Newnham, Cambridge, with a scholarship. At her graduation in 1890 she was placed in the Tripos lists "above the senior wrangler," thus achieving an extraordinary success. The achievement was peculiarly appropriate to the daughter of Prof. Fawcett, who had so zealously advocated the higher education of women.

FAY, JONAS, M. D., born in Massachusetts, in 1737, died in 1818. He was a surgeon in the French and Indian war, and was with Ethan Allen at Ticonderoga. He became a member of the State Council of Vermont after assisting to make it a separate State. He was also judge of the superior court, and agent of the State in Congress.

FAY, THEODORE SEDGWICK, an American author, born in 1807. In 1828 he became associate editor of the New York "Mirror." From 1837 to 1853 he was secretary of the American legation in Berlin, Germany, and from 1853 to 1861 was minister resident in Bern, Switzerland. He afterward lived in retirement in Berlin. His works cover a wide range of topics.

FAYE, HERVÉ AUGUSTE ÉTIENNE ALBANS, a French astronomer, born at St. Benoit, Indre, Oct. 5, 1814, studied astronomy with Arago, and in 1843 discovered the comet which bears his name. He was elected a member of the Academy of Sciences in 1847, became professor of geodesy at the École Polytechnique in 1848, and in 1854 was made rector of the Academy at Nancy. In 1873 he became inspector-general of scientific instruction, and in 1878 was appointed director of the Paris Observatory. He has published a number of astronomical treatises.

FAYERWEATHER, DANIEL B. (1821-90), an American philanthropist. At an early age he learned the trade of a shoemaker, and at thirty-four became a member of a firm of leather dealers in New York city. That move was the beginning of his success, and at the time of his death he represented the largest hide and leather business in New York, if not of the world. He left an estate estimated at \$6,000,000, of which \$2,195,000 were given to various institutions of learning and charity.

FAYETTE, the county-seat of Howard county, Mo., 12 miles from the Missouri River. It contains a female seminary and Central College.

FAYETTEVILLE, the county-seat of Washington county, Ark., and a delightful summer resort in the Ozark Mountains. It has manufactories of evaporated fruit, flour, and wagons. It has good public schools, contains the Arkansas Industrial University, and has a population of 2,942.

FAYETTEVILLE, a village of Onondaga county, N. Y., 10 miles east of Syracuse. It has flour and paper mills, and manufactures pearl barley, hydraulic cement, quick-lime. Population, 1,410.

FAYETTEVILLE, the county-seat of Lincoln county, Tenn. It has manufactories of woolen goods, broadcloths, cassimeres, carriages, and is a shipping point for corn and cotton. Pop., 2,410.

FAYRER, SIR JOSEPH, an English physician, born at Plymouth, Dec. 6, 1824. He received the degree of M. D. at Edinburgh and at the University of Rome, entered the East India Company's service in 1850 and served in the Burmese war of 1852, and during the mutiny of 1857. In 1859 he was appointed professor in the Calcutta Medical College, and in 1874 surgeon-general and president of the medical board of the India office. Among his writings are: *Poisonous Snakes of India*; *Tropical Diseases*; *Clinical Surgery in India*; *European Child-Life in Bengal*, and a number of professional works relating to questions of climate, etc.

FAZY, JEAN JAMES, Swiss statesman, born at Geneva, May 17, 1794, died there Nov. 6, 1878. He was educated at a Moravian school at Neuwied, studied law and settled in Paris. Here he took an active part in the opposition to the restoration, and when it became apparent that a republic could not be established in France he returned to his native city, where he became a leader in the radical Republican party. In 1846, when the party secured a change of the constitution, Fazy became head of the government, and during the fifteen years that the party continued in power exerted great influence at Geneva. He retired from public life in 1865.

FEATHERFOIL, WATER-FEATHER, or WATER-VIOLET, a species of *Hottonia*, so called from the finely divided leaves. The best known species are *H. inflata* of the United States and the European species *H. palustris*. They are curious primulaceous plants, which grow submerged in water, and thrust up long scapes above the surface to produce the blossoms.

FEATHER-GRASS, a genus of grasses remarkable for the long awns which give a graceful appearance to the species. It is a perennial plant and easy of cultivation; a native of the South of Europe.

FEATHER RIVER, California, a feeder of the Sacramento. It rises in two forks in the Sierra Nevada, and has a southerly course of about 250 miles. It is navigable for steamboats to Marysville, and large quantities of gold have been found on its banks.

FEBRICULA, a fever of short duration and mild character, having no distinct type or specific symptoms by which it can be distinguished or described.

FEBRIFUGE, medicines calculated to dispel or cut short fever.

FEBRONIANISM, a system of doctrine antagonistic to the admitted claims of the Roman pontiff, and asserting the independence of national churches propounded in 1763 by Johann Nikolaus von Hontheim, writing under the pseudonym of "Justinus Febronius."

FEBRUUS, the name of an old Italian divinity, whose worship was celebrated with lustrations during the month of February. The ceremonies instituted in his honor were believed to have the effect of producing fertility in man and beast. He was supposed to be the god of the lower world, and was worshipped as such by the Romans, and identified with the Greek Pluto.

FECHNER, GUSTAV THEODOR, a German naturalist, born at Gross-Särchen in Lower Lusatia, April 19, 1801, died Nov. 18, 1887. After studying at Leipzig University, he became professor of physics there in 1834, but was obliged to resign the position five years later on account of a disease of the eyes. He subsequently turned his attention to æsthetics and anthropology. His writings include *Ueber das höchste Gut* (1842), *Elemente der Psychophysik* (1860), *Ueber die Seelenfrage* (1861), and *Vorlesung der Ästhetik* (1876).

FECHTER, CHARLES ALBERT (1824-79), an actor, born in London and educated in France. He made his *début* in 1840 at the Salle Molière, Paris, in a piece called *Le Mari de la Veuve*. Later he appeared in the principal cities of Italy, Germany and England. In 1869 he came to the United States, and after a tour through the States returned to Europe, but again visited the United States in 1872, where he remained until his death, which occurred at his farm in Pennsylvania in 1879.

FECILA, or FÆCULA, a term applied to a starch obtained from various sources, but in France the term is generally restricted to the starch of the potato.

FEDERALIST, a collected series of articles, originally published in "The Independent Journal" 1787-88, written by Alexander Hamilton, James Madison and John Jay, for the purpose of leading the States at large, especially New York, to see the advantages of the proposed Constitution and the insufficiency of the existing confederacy. The basis of its argument is utility; and it shows clearly not only the ideas of the framers of the Constitution, but also the cardinal differences of the parties which have contended in American politics.

FEDERALSBURG, a village of Caroline county, Md., on Nanticoke River in the center of the great Peach Peninsula. Fruit-raising and the making of fruit-baskets are the chief occupations.

FEELAN, PATRICK A., Roman Catholic prelate, born in Tipperary, Ireland, in 1829, was educated at Maynooth, and came to the United States in 1852. He became president of a seminary at Carondelet, held a pastorate in St. Louis, and in 1865 was consecrated bishop of Nashville. In 1880 he became the first archbishop of Chicago.

FEIA, a large lake of Brazil, 130 miles northeast of Rio Janeiro, near the Atlantic, with which it communicates by an artificial canal called Furado.

FEINT: in naval or military matters, a mock assault or attack, usually made to throw an enemy off his guard against some real design upon his position.

FEITH, RHIJNVIS, a Dutch poet, born Feb. 7, 1753, at Zwolle, in Overijssel, died Feb. 8, 1824. He studied law, and in 1780 became mayor of his native place. Feith tried almost all kinds of poetry. In 1792 appeared *Het Graf* ("the Tomb"), a didactic though sentimental poem; in 1802, *De Ouderdom* ("Old Age"); in 1796-1810 four volumes of lyrical pieces, marked by a high enthusiasm and warmth of feeling. Of his tragedies the best known are *Thirza*, *Johanna Gray*, and *Inez de Castro*.

FELANICHE, or FELANITX, a town on the island of Majorca. On a neighboring hill is an ancient Moorish castle, with subterranean vaults. Population, 5,918.

FELDMANN, LEOPOLD, a German writer of comedies, born at Munich in 1803. He was apprenticed to a cobbler in 1815, and soon giving evidence of his determination to be a poet, his master sent him back to school, where in 1817 he wrote a play, *Der falsche Eid* (The False Oath), which was produced on the stage. After a few years of business he devoted himself entirely to literature. His first comedy, *Der Sohn auf Reisen* (The Son on His Travels), was acted at Munich with applause. His works are numerous, and reckoned among the best specimens of modern German comedy. In 1852 he published a collection of his comedies in six volumes.

FELDSPAR, or FELSPAR, a family of minerals which crystallize in several systems, and enter largely into the composition of all granitic and

many metamorphic rocks, and in decomposition are the source of clay.

FELICITAS, SAINT, a Roman matron martyred with her seven sons 164 A. D. under Marcus Aurelius. A woman of the same name suffered death with Saint Perpetua, A. D. 211, for refusing to offer sacrifices to idols.

FELIXIANS, a Spanish sect of the latter part of the eighth century, so called from Felix, Bishop of Urgel.

FELIPILLO, Peruvian Indian, born in Poeches in 1508; died in 1535. In 1527 Francisco Pizarro desired the Peruvians to give him two of their youths to be sent to Spain for an education, one of whom was Felipillo. In 1531 he returned with Pizarro to Peru, where as an interpreter he made himself useful to the Spaniards and their commanders. In 1532 he and Hernando de Soto were sent to treat with the Peruvian monarch, Atahualpa. On this mission Felipillo was smitten with one of the Inca's wives, and to further his purposes he gave such incorrect translations of the Inca's replies as to render the Spaniards suspicious of treachery. In September, 1535, when Almazro was on his way to invade Chili, Felipillo was his interpreter. During the march of the Spaniards he fled from the army, probably for the purpose of betrayal, was taken prisoner and strangled by the general's order. Before his death Felipillo confessed.

FELTON, CHARLES N., a United States Senator, Republican, from California; a business man, born in Erie county, N. Y., in 1832; received a common-school and academical education, and served six years as assistant treasurer and treasurer of the United States mint at San Francisco; was elected to the 49th and 50th Congresses. In 1891 he was elected by the California legislature to the United States Senate to succeed George Hearst, deceased.

FELTON, CORNELIUS C., LL. D., born in Massachusetts in 1807, died in Pennsylvania in 1862, a famous Greek and Latin scholar, who in 1860 was president of Harvard University. He was regent of Smithsonian Institution, and author of numerous publications.

FELUCCA, a vessel used in the Mediterranean. It is propelled by oars, from 16 to 24, and is rigged with two lateen sails. It has frequently a rudder at each end, to be applied as occasion demands. During the French war feluccas were armed with a heavy gun or two, and sent out as gun-boats against the English ships.

FEME COVERTE (*femina viro cōperta*): in the law of England, a married woman; a woman under cover, authority or protection.

FEMERN, or FEHMARN, an island in the Baltic belonging to the Prussian province of Sleswick-Holstein. It has an area of 71 square miles; is flat, fertile, and well cultivated, but has an unhealthy climate. Agriculture, fishing and stocking-weaving form the principal employments of the inhabitants. Population, 9,800.

FEHMGERICHTE, spoken of as the Holy Feme (or Fehme), and also known as the Westphalian or Secret Tribunals, were among the most remarkable phenomena of the Middle Ages, and supplied the place of the regular administration of justice, then in a deplorable condition. The origin of these courts has been ascribed to Charlemagne. In the general confusion which prevailed in Germany, when all laws, both civil and ecclesiastical, had lost their authority, the Fehmgerichte were organized for the purpose of arresting and controlling the incipient anarchy that threatened to bring chaos back again, and of inspiring with salutary terror, through the agency of their mysterious powers and solemn judgments, all rapacious and

lawless persons who, on account of the impotence of the ordinary legal checks, committed crime with impunity. The members of the Feme were called *Wissende*, "the knowing one," or the *initiated*. It was necessary that they should be born in wedlock, and be of the Christian religion. The sittings of the tribunal were either open or secret. The persons convicted, as well as those who refused to obey the summons, were given over to the Freischöffen. The first Freischöffe who met him was bound to hang him on a tree, or, if he made any resistance, to put him otherwise to death. A knife was left beside the corpse to show that it was not a murder, but a punishment inflicted by one of the Freischöffen.

FENCES, LAW OF. At one time landowners were by common law under no obligation to fence in their property; trespass was to be prevented by a duty imposed upon each owner of animals to keep them within his own estate, and a liability for all damages they might inflict upon his neighbor. At present, however, the matter of fence-building is regulated to some extent by statute. The duties imposed upon railroad companies to maintain fences along the line of their routes are particularly minute and exacting.

FENCIBLE, a word meaning defensive, and formerly applied to regiments raised for local defense, or at and only for a special crisis.

FÉNELON FALLS, a village in Victoria county, Ontario, between Cameron and Sturgeon Lakes, 16 miles north of Lindsay. It has a waterfall 20 feet high, 300 feet wide, and large lumber mills.

FENESTELLA, or **FENESTRELLA**, a genus of polyp, resembling the "lace coral," very common in Palæozoic rocks, ranging from the Lower Silurian to the Permian. Thirty species have been described.

FENNEC, or **ZERDA**, a species of *Canis*, native of Africa, resembling foxes in general form and in the bushy tail. The species are small, and have remarkably large ears and blue eyes.

FENTON, a village of Genesee county, Mich., 50 miles northwest of Detroit. It contains a flour mill, foundry, woolen factory, a cooperage, Baptist seminary, and a population of 2,182.

FENTON, REUBEN EATON (1819-85), an American statesman. He began the practice of law in Jamestown, N. Y., in 1841, and in 1848-51 was supervisor of the town of Carroll. In 1852 he was elected to Congress as a Democrat, but was defeated two years later. In 1856 he was elected again, however, and served from 1857 to 1864, when he resigned to become governor of his State. He received a gubernatorial reelection, and from 1869 to 1875 was a U. S. Senator.

FENWICK'S ISLAND, off the east coast of Worcester county, Md., 20 miles south of Cape Henlopen, in lat. 38° 27' 1" N., long. 75° 2' 59" W. It has a light-house 86 feet high.

FENYES, ELEK, a Hungarian geographer and statistical author, born in Csokaj, in the county of Bihar in 1807. He traveled over the country, and thoroughly acquainted himself with the state of the Hungarian kingdom, of which there had never before been an authentic survey. The first fruits of his enterprise appeared in 1840, under the title *Hungary and Its Annexed Parts, Geographically and Statistically Considered*. He was awarded the great prize of 200 ducats by the Hungarian Academy. All of his works are written in the Magyar tongue; some of them have been translated into German, and repeatedly published.

FERÆ: in the Linnæan system of zoölogy, an order of Mammalia, nearly corresponding to the Carnaria of Cuvier.

FERÆ NATURÆ, the term given in Roman law to those animals which flee the dominion of man, whether beast, bird, or fish, and retain their natural freedom. They were the property of any one who might catch them.

FER DE LANCE, the lance-headed or yellow viper, *Craspedocephalus lanceolatus*, a very venomous serpent of the West Indies and South America. It is from five to eight feet long, is capable of making considerable springs, and gives no warning of its attack. Its bite is very often fatal, and it is dreaded alike by man and beast.

FERGUS FALLS, a city and county-seat of Otter Tail county, Minn. It has good water-power, flour and paper mills. Population (1890), 3,772.

FERGUSON, SIR SAMUEL, poet and Celtic scholar, born at Belfast, Ireland, in 1810, died in 1886. He was educated at Trinity College, Dublin, called to the bar in 1838, and in 1859 was made queen's counsel. He gave much attention to Irish antiquities, and as president of the Royal Irish Academy gave a powerful impetus to the scientific study of early Irish art. His contributions to the magazines began to attract attention about 1832. He published *Lays of the Western Gael* (1865); *Congal, a Poem in Five Books* (1872); *Poems* (1880); and *The Forging of the Anchor* (1883). He was knighted in 1878.

FERGUSON, JAMES, D. C. L., F. R. S., a Scottish architect, born at Ayr in 1808, died Jan. 9, 1886. He was educated at the high school of Edinburgh, and after spending some years as an indigo-planter in Bengal engaged in extensive explorations of India, sketching and studying the rock-temples. In 1859 he was appointed a member of a royal commission on the defenses of Great Britain. His later works include *The Palaces of Nineveh and Persepolis Restored* (1851), *Hand-book of Architecture* (1855), *Tree and Serpent Worship* (1869), *History of Rude Stone Monuments* (1872). The chief features of his earlier works were embodied in *Cave Temples of India* (1880).

FERLAND, JEAN ANTON BAPTISTE (1805-65), a Canadian clergyman. He was ordained priest in 1828, and the same year named vicar of Quebec. In 1841 he became professor in the seminary of Nicolet, and seven years later was elected superior. In 1850 he became a member of the arch-bishop's privy council. In 1855 he was made chaplain of the military hospitals of Quebec, and the same year professor of Laval University. In 1864 he was elected dean of the faculty of arts in that university. He was the author of several books relating to Canada.

FERMATA: in music, the name given to a pause or resting-point, generally marked by the sign ♯. The notes over which this sign is placed are prolonged beyond their true length. It is frequently found near the end of a part of a composition, which affords an opportunity for the singer or player to introduce an extempore embellishment.

FERN, MALE, *Aspidium* (*Nephrodium*) *filix-mas*, a name given by old herbalists in contrast to the Lady Fern, *Asplenium* (*Lastrea*) *filix-femina*, which, from the aspect of their foliage and common association in woods, are imagined to represent the two sexes. The large subterranean rhizome contains a volatile oil, to which the long-established medicinal value as a vermifuge (particularly in tapeworm) is due.

FERNANDINA, a port of entry in northern Florida, and county-seat of Nassau county, on the west side of Amelia's Island, between Prince William and Nassau Sounds, Amelia River and the Atlantic. It affords good anchorage, has a light-house, large foreign and coast trade in cotton and

naval stores, has manufactories for creosoting lumber and piling, and for making superior plastering fiber from raw palmetto. The city has a steamboat line to New York. Population, 2,803.

FERNS. See *Britannica*, vol. IX, p. 100.

FERN, SWEET, a shrub of the natural order *Amentaceæ*, sub-order *Myricææ*, a native of the mountain woods of North America, forming a small bush with linear pinnatifid, fern-like leaves. Its leaves have a powerful aromatic fragrance when rubbed. It is tonic and astringent, and much used in the United States as a domestic remedy for diarrhoea.

FER OLIGISTE: in mineralogy, a term applied to a variety of anhydrous red oxide of iron, otherwise called *Specular Iron Ore*. The famous Swedish, Russian and Elba iron are in greater part prepared from this iron ore. Specular iron ore is found mostly confined to crystalline or metamorphic rocks.

FERONIA, an Italian goddess, especially honored among the Sabines. Little is known concerning the myth, and she has been variously regarded by commentators as goddess of commerce, of liberty, and as the goddess who presided over the woods and groves.

FEROZABAD, or FIROZABAD, a town of British India, 24 miles east of Agra. It is surrounded by a wall, outside of which are many mounds and interesting ruins. Population, 16,023.

FEROZESHAHR, a village within the district of Ferozepore. It claims notice mainly as the scene of the second in order of the four great battles of the first Sikh war. See *Britannica*, vol. XX, p. 112.

FERRANDINA, a town in the south of Italy, in the province of Basilicata, on a height on the right bank of the Basento, 35 miles southeast of Potenza. It produces an excellent wine. Population, 7,086.

FERREIRA, ALEXANDRE RODRIGUES, born in Bahia, April 27, 1756; died in Lisbon, Portugal, April 23, 1815. He studied at Coimbra, and in 1770 became professor of natural history in that university. In 1778 the government of Portugal appointed him to make researches into the natural history and geography of the country bordering the Amazon river, but it was not until 1783 that he was enabled to engage in the Brazilian exploration. In 1792 the explorer returned to Belem, and a year later went to Lisbon. In Portugal he became connected with the ministry of marine, and in 1796 was made superintendent of the royal cabinet of natural history and of the botanical gardens.

FERRIER, DAVID, a Scotch physician, was born in Aberdeen in 1843. He was educated in Aberdeen and studied medicine in Heidelberg and Edinburgh. In 1872 he became professor of forensic medicine at King's College, London. His *Functions of the Brain* was published in 1876, and *Localization of Cerebral Disease* in 1878. He is a Fellow of the Royal Society, and of the Royal College of Physicians. He is a prominent advocate of vivisection.

FERROTYPE, a term applied to designate some photographic processes in which salts of iron play an important part. The term is also applied by photographers to a cheap and instantaneous method by which a positive picture is fixed, by the collodion process, on thin sheets of iron.

FERRUGINOUS, a term employed in chemistry to denote the presence of iron in natural waters, minerals, etc. It is synonymous with the term chalybeate.

FERRY. See *Britannica*, Vol. IX, p. 111.

FERRY, JULES, an eminent French statesman, born at Saint-Dié in 1832. He was admitted to the

Paris bar in 1854, and identified himself with the opponents of the Empire. He was condemned as one of the "thirteen" in 1864. In 1869 he was elected to the Corps Legislatif. He voted against the war with Prussia, but during the siege he was a prominent member of the Government of National Defense. After the war he was minister at Athens, and in 1879 he became minister of public instruction. He introduced a bill directed against the Jesuits, which was passed by the deputies, but twice thrown out in the Senate. The expulsion of the Jesuits was effected by decree founded upon disused laws, and the ministry was dissolved in 1880. He then formed a cabinet and embarked on a policy of "colonial expansion." His cabinet resigned in 1881 on the question of the expedition to Tunis. He became prime minister again in 1883, but his ministry was overthrown in 1884 by an adverse vote relative to the war with China. This was regarded as his political death and he continued in retirement for nine years, until, in the beginning of 1893, he was recalled to public life during the Panama Canal excitement. He was forthwith elected to the presidency of the Senate, but died suddenly a few days later, in March, 1893.

FESA, or FASA, a town of Persia, in the province of Fars, 80 miles southeast of Shiraz, is situated in a mountain defile, and is of considerable size. It has manufactories of silken, woolen, and cotton fabrics and some trade in a kind of tobacco. Population, 18,000.

FERTILIZERS, a name given to substances which, when applied to the soil, supply it with the elements required to make it fruitful and productive. See *MANURE*, *Britannica*, Vol. XV, pp. 505-12.

FESCENNINE VERSES were a sort of dialogues in rude extempore verses, generally in saturnine measure, in which the parties rallied and ridiculed one another, and which formed a favorite amusement of the country people on festive occasions. The amusement often degenerated into licentiousness that at last required the curb of law. The style originated at Fescennia, and became popular at Rome.

FESCUE (*Festuca*), a large and widely diffused genus of grasses, very nearly allied to brome grass, and including many of the most valuable pasture and fodder grasses.

FESS. The fess in heraldry consists of lines drawn horizontally across a shield, and containing the third of it between the honor point and the nombril. It is one of the honorable ordinaries, and is supposed to represent the waist belt or girdle of honor, which was one of the insignia of knighthood. A shield, or charge in a shield, is said to be *party per fess* when it is horizontally divided through the middle, or, as the French say, simply *coupé*. Fesswise is said of a charge placed in *fess*—that is to say, horizontally across the shield.

FESSENDEN, WILLIAM PITT (1806-69), a United States Senator. He was admitted to the Maine bar in 1827. In 1832, and again in 1840, he was elected to the State legislature. In 1840 he became a member of Congress, and in 1845-46 was once more in the legislature, and also in 1853 and 1854. He took his seat in the United States Senate in 1854, and was reelected in 1859. In 1864 he was called to the head of the Treasury, but resigned the following year to return to the Senate, to which he had been elected for the third time. During his service in the Senate Mr. Fessenden was an acknowledged leader of the Republican party.

FESSLER, JOSEPH, an Austrian prelate born at Lochau, Tyrol, Dec. 2, 1813, died April 25, 1872. He studied theology at Brixen, was ordained in 1837, in 1841 became professor of church history and

canon law at Brixen, and in 1852 professor of church history in the University of Vienna. He was made bishop of St. Pölten in 1865, and was general secretary of the Vatican Council in 1869. He published *Institutiones Patrologicae* (1850-52), and *Sammlung Vermischter Schriften* (1869).

FESTOON: in architecture, a sculptured wreath of flowers or fruit, frequently used as an ornament in Roman and in Renaissance buildings. Like many of the other ornaments of classic architecture, it owes its origin to one of the sacrificial emblems, namely, the flowers with which the heads of the animals, the altars, etc., used to be decorated. The festoon occurs along with bull's heads on the frieze of the temple of Vesta at Tivoli.

FETID LIMESTONE, a variety of limestone which gives out, on being violently rubbed or struck with a hammer, a smell like that of sulphureted hydrogen gas. It has a dark color, produced, very probably, from the perishable portions of the animals whose hard skeletons compose the rock.

FEU-DE-JOIE, or **RUNNING FIRE**, a discharge of musketry into the air, made in honor of a victory or other occasion. It commences with the right hand man of the line, who discharges his rifle, and is followed successively at scarcely perceptible intervals by the man on his left until the extreme left of the line is reached. The effect much depends on the regularity with which the slight interval between the discharge is preserved.

FEUILLANS, **CONGREGATION OF**, a reform of the Cistercian order, remarkable as forming part of the great religious movement in the Roman Catholic church during the 16th century, contemporary with and probably stimulated by the progress of the Reformation. The author of this reform was Jean de la Barrière, abbot of the Cistercian monastery at Feuillans in Languedoc, who laid down for himself a new and much more austere course of life, in which he soon found many associates among the brethren of his order. The rule thus reformed was approved by Pope Sixtus V. The name was adopted by a French revolutionary club which held its meetings in the convent of the order in the Rue St. Honoré in Paris.

FEUILLET, **OCTAVE**, a French novelist, born at Saint Lo, in La Manche, Aug. 11, 1812, died Dec. 29, 1890, was educated at the College of Louis le Grand, Paris. He was for some time a literary assistant of Dumas, and began his own career with *Le Fruit Défendu* in the "Revue Nouvelle." In 1848 he published in the "Revue des Deux Mondes" a series of proverbs, comedies, tales, and romances which were collected in *Scènes et Proverbes* and *Scènes et Comédies* (5 vols., 1853-56). In 1862 he was elected to the French Academy, and was afterwards librarian to the emperor. His most noted novel, *Le Roman d'un Jeune Homme Pauvre* (1858), gained great popularity throughout Europe, and *Histoire de Sibylle* (1862) was also very successful. These were followed by *M. de Camors* (1867); *Julia de Trécœur* (1872); *Un Mariage dans le Monde* (1875); *Les Amours de Philippe* (1877); *Le Journal d'une Femme* (1878); *Histoire d'une Parisienne* (1881), and *La Mort* (1886). He also wrote many successful comedies.

FEVEDA, an island of British Columbia, situated in the Gulf of Georgia, between Vancouver Island and the continent. It possesses a snug harbor. Its formation is understood to be wholly of limestone.

FEVER BUSH, the *Lindera Benzoin*, a lauraceous shrub common in the Northern States. It has an agreeable aromatic odor, and decoctions of its bark and leaves are used as a remedy for low fevers and other complaints. It is also called spice bush and Benjamin tree.

FEVERFEW, a perennial plant botanically allied to Camomile, and much resembling it in its properties, but differing in appearance, the segments of its leaves being flat and comparatively broad and its flowers smaller. Its habit of growing is erect, its stem is branched, and from one to two feet high. It has a strong and somewhat aromatic smell. The double varieties are common in gardens. It has been much cultivated for medicinal purposes, and is used in the cure of fevers.

FEVERS. See *Britannica*, Vol. IX, p. 125.

FEVERWORT, a perennial plant of the natural order *Caprifoliaceae* having an erect, round, hairy, fistular stem, from one to four feet high, opposite ovate-lanceolate entire leaves, axillary whorls of flowers, with tubular 5-lobed corolla and leathery three-seeded berries. It is found in North America, where it is dried and the roasted berries have been occasionally used as a substitute for coffee. It is chiefly valued for its medicinal properties.

FIASCO, a failure in a musical or dramatic performance. It is a term borrowed from the Italian theater, and now naturalized in France and Germany. In Italy it is not uncommon to hear an audience cry: *Olà, olà fiasco*, even when the singer has made only one false note.

FIBRE. See *Britannica*, Vol. IX, p. 131.

FINDLAY, a city of Ohio, and county-seat of Hancock county, located in the northwestern part of the State, about 45 miles south of Toledo. In 1884 there were in Findlay three public school buildings, and in 1890 there were 12. During the same period the churches increased in number from 13 to 20. An elaborate system of water works has been constructed at a cost of \$350,000, and a court house erected costing \$320,000. The city is an important manufacturing center, there being in 1891 no less than 120 manufactories. Natural gas is the principal fuel. Population in 1880, 4,633; in 1890, 18,674.

FICHET, **GUILLAUME**, born early in the 15th century, was rector of the University of Paris in 1467, and afterwards held office under Pope Sixtus IV. Through his influence the printing press was brought from Germany to the Sorbonne.

FID, a large, pointed pin with an eye at the thick end. It is made of iron or lignum vitæ, and is used by sailors in separating and interlacing the strands of which the rope is composed. A *mast-fid* is a bolt inserted through the bottom of a ship's top-mast, with ends resting on the trestle-trees sustained by the head of the lower-mast or top-mast. Unless the mast-fid be withdrawn, the supported mast cannot be lowered.

FIDDMIN, a village of the Fayoom, inhabited by Mussulmans and Copts. It is remarkable for a large olive popularly supposed to be the original one planted in Egypt, and yielding annually 268 pounds of olives.

FIELD: in heraldry, the whole surface or content of the escutcheon or shield. It is so called, according to some, because it represents the field of battle on which the achievements or charges represented on it are supposed to have been gained. In blazoning, the tincture or metal of the field must be the first thing mentioned.

FIELD, **CYRUS WEST**, whose name is identified with submarine telegraphs, was born in Stockbridge, Mass., in 1819, and became a merchant in New York city. In 1853 the project of a submarine cable interested him, and he organized the New York, Newfoundland, and London Telegraphic Company in 1854, and the Atlantic Telegraph Company in 1856. In 1858 the first trans-Atlantic telegraph was completed, but soon ceased to work, and Mr. Field was driven to renewed exertions,

until in 1865-66 another cable was laid by the *Great Eastern*, and communication established. He has been largely interested in the New York elevated railway system. He died in July, 1892.

FIELD, DAVID DUDLEY (1781-1867), an American clergyman, was licensed to preach in 1803. He was ordained in 1804, and till 1818 was minister in the Congregational church in Haddam, Conn. From 1819 to 1837 he was pastor of the church at Stockbridge, Mass., and from the latter year until 1844 was again in Haddam. From 1844 to 1851 he had charge of the church in Higganum, when he retired, and returned to Stockbridge, where he passed his remaining days. He wrote considerably on historical topics.

FIELD, DAVID DUDLEY, an American lawyer, son of the preceding, born in 1805. He was admitted to the New York bar in 1828, and continued in the active practice of his profession until 1885. In 1847 he was appointed commissioner on practice and pleadings, and as such took part in the preparation of the code of procedure. The commission submitted the completed *Codes of Civil and Criminal Procedure* to the legislature in 1850, and they have been enacted into law. In 1857 he was appointed by New York State head of a commission to prepare a political code, a penal code and a civil code, and they were completed in 1865. In 1873 Mr. Field presented to the Social Science Congress his *Outlines of an International Code*, which has been translated into French, Italian, and Chinese. As a result an association was formed for the reform and codification of the laws of nations, and Mr. Field was chosen its first president. This association also had for its object the substitution of arbitration for war in the settlement of disputes between nations. Besides numerous contributions to current literature on political topics, Mr. Field has published *Speeches, Arguments, and Miscellaneous Papers* (New York, 1886).

FIELD, HENRY MARTYN, an American clergyman, born in Stockbridge, Mass., April 3, 1822. He graduated at Williams College, studied theology, and from 1842 to 1847 was pastor of a Presbyterian church in St. Louis, Mo. During 1847-48 he traveled in Europe, and on his return to the United States published an account of his experiences and observations abroad. In 1855 he became one of the editors of "The Evangelist," New York, subsequently becoming its proprietor. He is the author of *The Irish Confederates* (1850); *Summer Pictures from Copenhagen to Venice* (1859); *History of the Atlantic Telegraph* (1866); *From the Lakes of Killarney to the Golden Horn* (1876); *From Egypt to Japan* (1878); *On the Desert* (1883); *Among the Holy Hills* (1883); *The Greek Islands and Turkey After the War* (1885); *Blood Thicker than Water*, and *A Few Days Among Our Southern Brethren*.

FIELD, KATE, an American lecturer, born in 1840. After completing her studies in the United States she made long visits to Europe, and became correspondent for the "New York Tribune," the "Chicago Tribune," and the "Philadelphia Press." In 1874 she appeared in *Peg Woffington* at Booth's Theater, New York, and for a time followed the stage with some success. Of late years she has been engaged in lecturing on the topics of the day.

FIELD, STEPHEN JOHNSON, an American jurist, son of David Dudley Field, Sr., born in 1816. In 1837 he began the study of law with his brother, David Dudley, and after his admission to the bar became a partner in the firm. In 1849 he went to San Francisco, and became a member of the first legislature held after the admission of California into the Union. In 1857 he was elected judge of the Supreme Court of California, and in 1863 was

appointed to the supreme bench of the United States. In 1869 he was appointed professor of law in the University of California.

FIELD-ALLOWANCE, a daily allowance granted to officers of the British army in consideration of extra expense entailed upon them in consequence of military operations.

FIELD-GLASS, the lens usually interposed between the object-glass and eye-glass of a microscope, which, receiving the diverging rays from the former before they form an image, contracts the dimensions of the image and increases its brightness, so as to render it of a proper size and degree of distinctness for being viewed by means of the eye-glass.

FIELDING, ANTHONY VANDYKE COPLEY (1787-1855), an English water-color painter. He received his early instruction at home before being placed under John Varley. He worked in the house of Dr. Monro, and in 1810 began to exhibit with the Water-color Society, succeeding Cristall as president in 1831. His early works show breadth, freedom of treatment, and a fine sense of atmosphere, but in later life the quality of his art deteriorated greatly.

FIELD-MOUSE, or MEADOW-MOUSE, a name popularly given to several species both of mouse and vole.

FIELD-OFFICERS: in the army, officers—viz., majors, lieutenant-colonels and colonels—competent to command whole battalions, in contradistinction to those merely intrusted with company duties, as captains, lieutenants and ensigns.

FIELD OF VIEW, the whole space within which objects can be seen through an optical instrument; more strictly, the space within which the image of an object may be seen by whole pencils. That part of the image which is seen by partial pencils of the light from the object-speculum or lens is called the *ragged edge*, and usually a diaphragm is employed to cut it off from the view of the observer altogether.

FIELDS, JAMES THOMAS (1817-81), an American poet, essayist, lecturer and publisher. From 1838 to 1870 he was a member of the firm of Ticknor, Reed & Fields, of Boston, and from 1862 to 1870 edited the "Atlantic Monthly." His contributions to letters were of a high order, and he exerted an important influence on American literature.

FIELD-TRAIN, a department of artillery, consisting of commissaries and conductors of stores, whose duty it is to attend to the formation of proper depots of shot, etc., between the front and base of operations, and to keep a due proportion constantly at the service of each gun during an engagement; they are also responsible for the safe custody of the ammunition.

FIELD-WORKS, intrenchments and other temporary fortifications, thrown up by an army in the field either as a protection from the onslaught of a hostile force or to cover an attack upon some stronghold.

FIFE, DUKE OF, ALEXANDER WILLIAM GEORGE DUFF, was born on Nov. 10, 1849, created Earl of Fife in 1885, and Duke of Fife in 1889, on his marriage with Princess Louise Victoria, the eldest daughter of the Prince of Wales. The Duke was educated at Eton; is Lord Lieutenant of Elginshire; a member of the Council of the Duchy of Lancaster; and a partner in the metropolitan banking firm of Sir Samuel Scott and Co. He sat as M. P. for Elgin and Nairn, in the liberal interest, in 1874-79; went on a special mission to the King of Saxony in 1882; and in recognition of his diplomatic services received the first Order of Saxony.

FIFTH: in music, an interval comprising five degrees of the scale. A perfect fifth is the equal to three diatonic steps and a half; a fifth a half-step shorter is termed *diminished* or *minor*, and one a half-step longer is termed *augmented* or *superfluous*.

FIGHTING-FISH, a small fresh-water fish of the family *Anabantidae*. It is a native of Asia and particularly of Siam, where it is kept in glass globes on account of its pugnacity. When two of these creatures are brought together they rush immediately to combat. Fish fights are a favorite amusement of the Siamese.

FIGUERAS, ESTANISLAO, born at Barcelona, Spain, Nov. 13, 1819; was elected to the cortes as a republican in 1850, and was imprisoned for conspiracy against Isabella. In 1870 he was a member of the provisional government, and in 1873, after the abdication of Amadeus, was president of the Spanish republic. He died in Madrid in 1882.

FIGUEIRA, a watering-place in the Portuguese province of Beira, at the mouth of the Mondego, 23 miles west by south of Coimbra. Its harbor is excellent, but difficult of access. Population, 4,470.

FIGUIER, GUILLAUME LOUIS, a French scientific writer, born at Montpellier, Feb. 15, 1819. He studied chemistry there, and in 1841 received the degree of M.D. He was appointed professor at the Montpellier school of pharmacy in 1846, and seven years later removed to Paris to occupy a similar post there. He has published: *Exposition et Histoire des Principales Découvertes Scientifiques Modernes* (1851), *L'Alchimie et les Alchimistes* (1854), *Histoire du Merveilleux dans les Temps Modernes* (1859-60). A number of his popular presentations of science and natural history have been translated into English. Among these are: *The Vegetable World*; *The Ocean World*; *The Wonders of Science*, and *The Wonders of Industry*.

FIGURANTES, the term applied in the ballet to dancers who do not come forward alone, but dance in troops, and also serve to fill up the scene and form a background for the solo dancers.

FIGURE: in general, the outline or surface of a body determining its form or shape. In arithmetic figure denotes a numerical character. In geometry it denotes a surface or space inclosed on all sides, and is superficial when inclosed by lines, solid when inclosed by surfaces.

FIGURED, or FIGURATE: in music, opposed to *simple*, characterized by the use of passing notes. The term was formerly used in ecclesiastical music to distinguish chants which had been varied, and rendered more ornamental and expressive, from the original Gregorian chants which were exceedingly plain. The term was afterwards applied to elaborate pieces in distinction from those of "strict" style.

FIGURED BASS: in music, a base part with figures placed over the notes, which indicate the harmony to be played to each note, and serve as a guide to the accompanist.

FIGWORT, a genus of plants of the natural order *Scrophulariaceæ*. They are mostly herbaceous and natives of temperate regions. The roots of some are purgative and emetic.

FIIJ, or FEJEE, an island group and British crown colony in the South Pacific. For the history and earlier statistics of the Fiji Islands, see *Britannica*, Vol. IX, pp. 155-158. Fiji was ceded to the Queen of England by the native chiefs and people, and the British flag hoisted by Sir Hercules Robinson, Oct. 10, 1874. The government is administered by a governor appointed by the crown, assisted by an executive council, consisting of the colonial secretary, the attorney-general, the receiver-general, and the commissioner of lands. Laws are

passed by a legislative council, of which the governor is president. It comprises six official members and six unofficial members nominated by the crown. For the purposes of native government, the colony is divided into 16 provinces, in 14 of which a superior native chief exercises, under the title of *Roko-Tui* of his province, a form of rule which recognizes to a large degree the customs and the system of administration by which the people governed themselves prior to the establishment among them of a European form of government. In two of the provinces there are resident European officers as commissioners. The island of Rotumah was added to the colony of Fiji in 1881.

The present total area of the Fiji Islands is about 7,740 square miles. In 1891 the population of the colony was as follows:

Europeans.....	2,036
Half castes.....	1,076
Indian immigrant laborers.....	7,468
Polynesian immigrant laborers.....	2,267
Fijians.....	105,800
Natives of Rotumah.....	2,219
Others.....	314
Total.....	121,180

Two public schools receive state aid to the extent of about \$1,200 a year each, one in Suva and one in Levuka. The number of scholars attending these two schools in 1889 was 157. The education of the native Fijians is almost entirely conducted by the Wesleyan Mission, in whose schools 40,667 children were taught in 1889. A number of schools are also conducted by the Roman Catholic mission, the number of scholars being 2,586. There is also an industrial and technical school carried on by the government in which 62 native youths are being trained in the elementary branches of reading, writing, and arithmetic, in boat-building, house-building, and cattle-tending.

The estimated revenue for 1891 was £65,376, and the expenditure £63,716. The public debt of the colony is £248,999.

In 1893 there were, under cultivation by European settlers: bananas, 2,460 acres; coffee, 27 acres; cocoanuts, 18,939 acres; maize, 334 acres; sugar-cane, 12,626 acres; yams, 168 acres; tobacco, 25 acres; pine-apples, 127 acres; other products, 648 acres. There were in the colony, in 1893, 695 horses and mules, 8,768 cattle, 6,838 sheep, and 4,502 Angora goats.

The value of the total foreign trade during the five years from 1885 to 1889 inclusive was as follows:

Year.	To'l For'gn Trade.	Imports.	Exports.
	£	£	£
1885	627,780	301,030	326,750
1886	514,125	230,629	283,496
1887	469,151	188,071	281,080
1888	560,200	183,222	376,978
1889	553,674	189,393	364,281

The principal imports during 1892 were hardware, drapery, meats, rice, breadstuffs and biscuits, bags and sugar mats, and timber; and the exports, sugar, copra, green fruit (consisting chiefly of bananas), distilled spirits, desiccated cocoanuts, peanuts, and tea.

FILE: in a military sense, a row of men arranged one behind the other forming a line from front to rear. A battalion stands two deep, or in two ranks, front and rear, wherefore a file consists of two men. Sometimes the battalion may be formed much more solidly, as in a square, when

the file comprises a far larger number. The number of files in a company describes its width, as the number of ranks does its depth.

FILIOQUE, a Latin term interpolated in the Nicene Creed, and held to teach the procession of the Holy Ghost from the Father and the Son. The Greek church denying and the Latin church retaining this formula, it has given rise to many controversies, and has been the chief point which for so many ages has kept the two churches apart.

FILIPO D'ARGIRO, SAN, a town of Sicily, in the province of Catania, situated on the right bank of the Traina. A considerable quantity of saffron is grown in the vicinity. Population, 7,500.

FILLET: in heraldry, an ordinary which contains the fourth part of the chief.

FILUM AQUÆ, an imaginary line dividing the soil underneath a river into two equal portions.

FIN-BACK, a species of whale with a prominent dorsal fin not found in other species.

FINDLAY, the county-seat of Hancock county, is a flourishing town in the northwestern portion of Ohio. In 1885 it possessed few commercial advantages, but by the discovery of natural gas in that year it received an extraordinary impulse. By June 1, 1889, there were 43 wells in operation. The "Great Karg" well was the largest in the world until the discovery of the Tippecanoe in 1888. Numerous manufactories have been established, eleven glass works employ 1,700 men, and two pressed-brick works have an output of 40,000,000 bricks per annum. Findlay was one of the first places where aluminum was manufactured in commercial quantities. The city has several fine public buildings, among them a court house, a substantial stone structure costing over \$300,000. There are 18 churches. Pop. (1890), 18,553.

FINERTY, JOHN F., born in Galway, Ireland, in 1846, was educated in private schools, and became identified while still a boy with the Irish revolutionary movement. In 1864 he left Ireland, came to this country, and served for about a year in the Union army. He became attached to the press of Chicago in 1865, and in this capacity witnessed the Fenian raids in Canada in 1866 and 1870. Thereafter he served in various capacities on other Chicago newspapers, and as a press correspondent visited the Rio Grande, Texas and Old Mexico, and was with General Miles during the historical campaign against Sitting Bull in 1879. Mr. Finerty organized the Irish Land League convention which met in Chicago in 1881, and which raised \$500,000 for the cause of Ireland. In 1882 he began the publication of the *Citizen* newspaper, and in November of that year was elected to Congress as an Independent from the second district of Illinois. He published in 1890, "Warpath and Bivouac, or the Conquest of the Sioux Indians."

FINLAY, ROBERT BANNATYNE, was born at Edinburgh in 1842, and educated at the Edinburgh University, where he studied medicine and took his doctor's degree in 1863. Two years later he gave up medical practice and began to study for the English bar. He was called, in 1867, at the Middle Temple. He joined the Southeastern Circuit, and was made a Queen's Council in 1882. At the general election of 1885 he succeeded in gaining a seat for Inverness Burghs, and in 1886 he was again returned for the same constituency as a Unionist Liberal. Up to the election of 1885 and the rise of the Home Rule question, Mr. Finlay had made no great mark in the House, but during the debates on Mr. Gladstone's Government of Ireland Bill he rose into a very important position. Since that time Mr. Finlay has been before the public in several capacities.

FINLAND. For the history and earlier statistics of the Grand Duchy of Finland, see Britannica, Vol. IX, pp. 216-220. The constitution of Finland, dating from the year 1772, reformed in 1789, and slightly modified in 1869 and 1882, provides for a national parliament, consisting of four estates—the nobles, the clergy, the burghers, and the peasants—convoked by the "Grand Duke," Emperor of Russia, for four months. They discuss the schemes of laws proposed by the emperor, who has the right of veto. The unanimous assent of all four chambers is necessary for making changes in the constitution and for levying new taxes. The national representatives have been regularly convoked, since 1861, every four or five years; the last time they met was in 1888. The schemes of laws are elaborated by the "Committee for the Affairs of Finland," which sits at St. Petersburg, and consists of the state secretary and four members, nominated by the crown (two of them being proposed by the Senate). The Senate, which sits at Helsingfors under the presidency of the governor-general, is nominated by the crown. It is the superior administrative power in Finland, and consists of two departments, justice and finance, which have under them the administration of posts, railways, canals, custom-houses, hygiene and the tribunals. The military department is under the Russian ministry of war, and the foreign affairs under the Russian chancellor. Finland has its own money and system of custom-houses. Recent laws have, however, altered this to some extent. According to a law of Aug. 14, 1890, the circulation of Russian rubles and silver money has been rendered obligatory. The penal code, elaborated by the Senate, which was to have been promulgated on Jan. 1, 1891, was suspended by the Russian government till further notice.

The present area of Finland is 144,255 square miles; population (1888), 2,305,916. The following table shows the area of the several provinces, with the population for 1888:

Province.	Area.	Populat'n.	Density per sq. mile.
Abo-Bjorneborg	9,335	380,501	40
Kuopio	16,499	277,635	16
Nyland	4,586	227,388	49
St. Michel	8,819	175,110	19
Taxasthus	8,334	245,690	29
Uleaborg	63,971	234,015	3
Viborg	16,627	380,823	19
Vasa	16,084	398,750	24

The gradual increase of the population is seen from the following table:

Years.	In towns.	In country.	Total.
1830	75,489	1,396,588	1,372,077
1870	131,603	1,637,166	1,768,769
1880	173,401	1,837,381	2,060,782
1885	199,484	2,003,874	2,203,358
1886	204,998	2,027,380	2,232,378
1887	211,589	2,069,333	2,270,912
1888			2,305,916

Of the total population there were, in 1888, 2,261,741 Lutherans; 41,896 Greek Orthodox and Raskolniks; 2,279 Roman Catholics.

The chief towns, with the population (1888), are: Helsingfors, 58,417; Abo, 27,996; Tammerfors,

18,097; Wiborg, 17,494; Uleaborg, 12,183; Bjorneborg, 9,632; Nikolaistad (Wasa), 8,454; Kuopio, 8,141.

The immigration in 1888 was 45,163, and the emigration 44,914.

In 1889 Finland had one university, with 1,703 students; one polytechnic, 132 students; 16 lyceums (12 state), 3,218 pupils; 16 progymnasiums, 1,402 pupils; 27 real-schools, 1,051 pupils; 52 girls' schools, 4,057 pupils; 971 primary schools and kindergartens, with 62,893 pupils; 4 normal schools, with 563 pupils. There are besides 7 navigation schools, with 113 pupils; 6 commercial schools, with 162 male and 135 female pupils; 32 Sunday professional schools, with 2,111 pupils; 2 agricultural institutes, 9 agricultural and 14 dairy schools, with 257 male and 148 female pupils; 18 trade schools, with 1,220 pupils.

The estimated revenue for 1890 was 54,153,331 marks (16,091,000 marks being left from previous budgets), and expenditures the same (17,543,562 marks being left for the next year). The public debt on Jan. 1, 1890, amounted to 85,130,944 marks, of which 7,851,700 marks internal.

The crop of 1887 was, in bushels: Wheat, 146,760; rye, 12,397,700; barley, 5,829,620; oats, 13,549,400; sarrazin, 46,130; peas, 385,270; potatoes, 15,110,720; flax, 1,717 tons; hemp, 983 tons. Of domestic animals Finland had: horses, 258,666; horned cattle, 952,640; sheep, 1,042,790; swine, 184,755; reindeer, 64,898; goats, 18,700; poultry, 258,642.

The chief articles of export are timber, butter, paper and card-board, iron, corn, cotton, leather, hides, tar, and pitch; of import, corn and flour, coffee, iron, woolen cloth, sugar, raw cotton, chemicals, leather-ware, machinery, tobacco, colors and oils.

FINLEY, JAMES BRADLEY (1781-1856), an American clergyman. In 1809 he entered the Methodist Ohio Conference, and in 1816-21 was a presiding elder. In 1821-27 he was a missionary to the Wyandot Indians, and from 1829 to 1845 was an itinerant minister. From 1845 to 1849 he was chaplain of the Ohio penitentiary, and then acted as conference missionary and pastor in Southern Ohio till his death. His principal publications are reminiscences of his experiences.

FINLEY, SAMUEL (1715-1766), an American educator, born in Ireland, came to the United States in 1734. He studied for the ministry, was licensed to preach in 1740, and ordained two years later. He was pastor in different places until 1761, when he was chosen president of Princeton College, Princeton, N. J. He held this position until his death.

FINMARK, a province of Norway, lying between 68° 30' and 71° north latitude, and 17° and 31' east longitude, and constituting Norwegian Lapland. It has an area of about 20,000 square miles. The interior is intersected by a range of snow-covered

mountains, reaching an elevation of 4,000 feet. Agriculture is impracticable above an elevation of 100 feet; fish and game constitute almost the sole food of the inhabitants. The principal sources of wealth are the reindeer in the north, and the cod-fisheries in the south. Population, 24,071.

FINNEY, CHARLES GRANDISON (1792-1875), an American Presbyterian clergyman, licensed to preach in 1824. He became an evangelist and labored with great success in Utica, Troy, Philadelphia, Boston and New York. From 1835 until his death he was professor of theology at Oberlin College, Ohio, and in 1851-66 was its president. He spent three years in England as a revivalist.

FINSTERAARHORN, the highest peak (14,026 feet) of the Bernese Alps.

FINSTERWALDE, a small town of Prussia, in the province of Brandenburg, situated on an affluent of the Black Elster, 40 miles north of Dresden. It has manufactories of cloth and machinery; spinning and weaving are also carried on. Population, 7,371.

FIORD, or FJORD, the Scandinavian name for a narrow arm of the sea penetrating deeply into the land and bounded by more or less precipitous slopes or cliffs on each side. The coast of Norway, of Iceland and Greenland abound with examples of fiords.

FIR. See Britannica, Vol. IX, p. 222.

FIRE-ARMOR, appliances fitted for use in burning buildings to facilitate escape or the use of fire-extinguishing apparatus, and for work in mines filled with choke-or fire-damp. It is of two kinds. In one the wearer breathes from a supply of compressed air carried in a suitable reservoir; in the other the air is filtered through some porous substance, moistened and interposed between the wearer and the atmosphere. The efficacy of each has been proved beyond dispute. The latest invention is that of George Crofutt, 1873-74, termed the "eye and lung protector," a species of mask held over the face by an elastic band passing around the head. It weighs but a few ounces, and may be instantaneously fitted into place. The wearer breathes through a moist sponge contained in a porous cotton bag, which not only cools the air passing through it, but also eliminates dust, noxious gases, foul odors, etc. The eyes are protected by plates of transparent mica inserted in a duplex steel shell, so covered and edged with rubber as to exclude smoke and dirt.

FIREARMS, weapons, of whatever form, from which missiles, such as shot, shell or bullets, are propelled to a distance by the combustion of gunpowder or other similar explosive. See GUNS and GUNNERY, in these Revisions and Additions.

FIREBOTE: according to English law, the right of a tenant to cut wood on the estate for the purpose of fuel.

FIRE DEPARTMENT AND APPARATUS, RECENT IMPROVEMENTS IN.—One improvement has followed another so rapidly, in the past few years, that even the apparatus of a decade ago seems antiquated.

The steam engines of later years vary materially in construction. In one type the boiler has inch tubes depending from its roof, like stalactites, down into the fire; thus, the water in them gets the full benefit of the heat; in another, small groups of tubes are hung like tiny steam radiators to the roof of the fire-box, and connected with the side of the box as well, so that the water circulates up through a nest of small tubes; a third

type has a coil of water-pipe running around the fire, and down into the side of the fire-box. Each type has its advocates.

A feature, not generally known by the spectator, is the water-tank for supplying the boiler. It is generally located under the driver's seat, and is used only when the engine is pumping salt or foul water.

The most powerful land engines have two steam cylinders, capable of throwing solid water through a two inch nozzle two hundred feet over level ground.

The hose is usually carried on a reel or spool supported on two or four-wheeled vehicles. A

very late invention is a simple four-wheeled truck, with a bed or box, in which the hose is laid flat. It is rapidly becoming popular; for in practice it is found that it can be stretched for work more quickly, and when the fire is out can be loaded more readily.

A WATER TOWER consists of an iron tube so pivoted over one end of a truck that its top may be raised to a height of 60 feet above the street pavement. The upper end of the pipe ends in a nozzle controlled by a man on the truck. Two, three, or four engines may be coupled at the base, and their united streams forced through the pipe and out at the nozzle. They send a solid two and a quarter inch stream through the top windows of a six-story building with ease. The earliest towers were put in position by man-power; the later ones are raised by carbonic acid gas, generated in a retort suspended near the rear axle of the truck, and acting upon the piston rods of two cylinders very like steam engine cylinders. The gas is quickly generated and in sufficient quantity to exert a pressure in the cylinder of over 100 pounds to the square inch. A derrick is raised

over the forward wheels of the truck, and with the aid of this derrick the pipe is rapidly brought into a perpendicular position by means of a metal rope, working over pulleys, and a hand winch.

LADDERS.—The trucks usually carry ten ladders, varying in length from ten to 75 feet. Some are 92 feet long. These longest are permanently fixed to turn tables on the trucks that carry them, and are raised by cranks, screws, and pulleys.

By their use, persons on the tops of buildings, or in the upper stories, can be quickly and readily swung over onto the roofs of adjoining buildings, or across the street to a place of safety.

SCALING LADDERS are unique contrivances, and consist of a single rod, with rungs passing through, or bound to it, and a hook with reach enough to grasp any wall over the window sill. Scaling ladders are of the greatest benefit in securing an entrance to a building through the windows, and in

rescuing lives. The fireman raises the ladder, drives the hook through the window of the first story, and catches it over the sill; climbs up, throws his leg over the sill, and lifts the ladder to the next story. If he discovers that the window immediately above is so full of flame that he cannot use it, he reaches with his ladder for one on either side, then swings loose, vibrating like a pendulum. He goes in this way to the proper height, when he lowers a cord to the ground, to which a life line is attached, and people who could not otherwise escape, are safely lowered.

THROWING A LINE WITH A RIFLE is a novel device for quickly reaching the top of a building. A smooth bore Remington rifle with a ten-inch wound barrel is used. The projectile is a long, pear-shaped cap that fits over the muzzle with the end of a light line fixed fast to a ring in its base. A blank cartridge does the work. The line goes upward a distance of 200 feet, and when it falls is caught, and used to draw up the heavier line.

THE NET.—If the fire be such that the life-line would be burned, and thereby be rendered worthless, there is provided a wheel-shaped net, made of slender ropes, and of 10 feet diameter. It is held by as many determined men as can get hold of it. When ready they call upon the victim to jump; and the frightened one, imprisoned by smoke and flame, and with no prospect but death if he stays, rarely disobeys the command. While not every one escapes unhurt, there are instances where men weighing 200 pounds have safely jumped a distance of 100 feet.

IRON PIPES fixed to buildings are of the greatest benefit by reason of being constantly in place. They are put both on the outside and the inside of buildings, according to the taste of the owner, and extend from the street or sidewalk above the roof, also to the cellars and sub-cellars, where they are especially valuable. On the inside short branches project from the main pipe, and to these are usually attached the necessary length of hose for protecting that story. Where buildings are thus provided for, it is only necessary to attach the engine hose to the iron pipe built on or into the house, and the fireman goes within to find everything ready for immediate use. Such pipes are of the greatest use when fires are smouldering in a cellar. The minutes lost in carrying hose through doorways, or breaking openings through sidewalks, have resulted in the loss of many buildings.

THE AIR-WASHER is a device for washing the smoke out of the air in any room, but is especially

intended for use in cellars. It is a short section of pipe fitted with a sprinkler after the manner of a lawn sprinkler. In its use a hole is cut through the floor; if no other way is found the washer is

passed through, the water turned on, and showers are thrown in all directions.

FLOATING ENGINES, or FIRE BOATS, the best of which are built of steel, are about 125 feet in length; 25 to 27 feet wide, and draw about 9 feet of water. They are provided with monster boilers, and triple expansion engines. There are two propeller wheels, one being connected with the rudder and the wheel shaft in such a way that it swings with the rudder, and aids the boat in turning almost upon her center.

The pumps are in four sets of two each. From them the water is forced into an aircamber, thence through four standing pipes which rise through the deck-house—two forward and two aft. The nozzles at the ends of the pipes are so attached that they control every possible direction in which it may be desired to turn them. The floating engines are kept with fires partially banked, but steam up. At a signal the fires are raked, the lines thrown off, the throttle thrown open, and the conflagration headed for. At a rate of nearly 20 sea-miles an hour she rushes along, dodging the sea-craft with remarkable ease by reason of the rudder-propeller attachment, and if the fire be at the water's edge, as on a pier or steamer, can run

so close that the flames envelop her stem. The whole power of the boilers is quickly turned upon the pumps with no loss of time, for there is no hose to lay. The force of the water driven through the five-inch nozzle is such that it carries all wood-work before it, tears off roofs, and even bursts through brick walls, thus obviating the use of axes.

On these floating engines there are always screens for protecting the men who would otherwise be exposed to the fury of the flames. The screens are made of steel plate, and are double, having an air-space between. Each section is six feet long, and four and a half feet above the rail arching over the deck. Peep-holes to look through, and other holes large enough to direct a small stream through are also provided. If the decks or any other part of the water engine become too hot for safety or comfort, the captain, instead of backing the boat out to cool off, turns the water on from skillfully arranged sprinklers, thus protecting the workers while they attend to the greater fire.

A FIRE-PROOF SUIT.—The Imperial German government has introduced a fire-proof suit of such efficiency that a fireman may approach a conflagration, either in a building or on board ship, with

STEAM FIRE ENGINE.

comparative freedom from danger. It consists of a helmet, jacket, trousers, boots, and mittens. The helmet is constructed of light wicker work, covered with a composition making it perfectly air and water tight. In the front part of the helmet is a glass window, which closes hermetically, but which may be opened and closed by the wearer as may be required. Connected with the helmet is the jacket and hose or trousers made of water-proof double material. The trousers are supported by leather suspenders. The jacket falls over the trousers at the waist, and is fastened by a belt. The sleeves of the jacket are connected with water-proof gloves. Passing through the back of the helmet is a tube for the conveyance of air, which is distributed by means of smaller tubes throughout the interior around the head of the wearer, thereby keeping the head constantly surrounded with fresh air, and also preventing the accumulations of moisture-cloudiness on the glass, thereby enabling the wearer to see and breathe freely.

The fireman thus encased is further provided with a water-tube, by means of which he is enabled to send a spray of water over himself as an additional protection against fire or heat. By a special tube he can convey water into the helmet

like a douche. Thus protected he can approach a fire with impunity, is enabled to make his investigations, and more successfully combat the danger, whether in dense smoke or fierce flame. The new costume has been adopted by all the fire brigades in Berlin, and by those of other continental cities, and has also been provided for all the vessels of the German navy.

ECONOMY OF TIME.—In no department of human industry is the value of time more clearly recognized than in the modern fire department. The fraction of a minute saved in the first attack upon a fire often means the saving of hundreds of thousands of dollars, while not infrequently a human life may depend upon the celerity with which the brave firemen reach the scene of a conflagration with their ladders, life-lines, nets, and other life-saving appliances. Every agency known to science for economizing time is utilized. The alarm is sounded by electricity (*q. v.*). The same current of electricity which sounds the note of warning in the engine-house releases the fastening of the horses in their stalls. These sagacious animals, thoroughly trained in the performance of their duties, instantly spring to their places in front of the engine. The harness, suspended from hooks overhead, drops

upon their backs, where it is quickly fastened with clasps, the doors of the engine-house fly open, and the horses dash into the street and away to the locality from whence came the alarm—barely *eight seconds* having elapsed between the sounding of the alarm and the exit of the engine from the engine-house. The sitting-room of the firemen is on the second floor, directly over the engine. Stairs which are provided as a means of reaching this room from below, require too much time to descend; hence large holes are made in the floor, in the center of each of which is a brass rod, reaching to the main floor, down which the firemen *slide* in order to save an extra second or two of time. The fireman who should use the stairway, descending it as

quickly as he might, would find, when he reached the ground floor, that the horses were harnessed, the fires lighted, and the engine half a block away. In order to make steam quickly, the water in the boiler of the engine is kept hot at all times, a stationary boiler in the engine-house keeping the water at a proper temperature when the engine is "at rest."

One of the important adjuncts of the fire department of a great city is a school for horses, where these animals undergo a thorough and systematic course of education. After months of patient training only the more intelligent and sagacious horses are assigned to active duty, it being impossible to educate a large percentage of the

LADDER TRUCK.

HOSE CARRIAGE.

animals to the requirements of a well-ordered fire department.

FIRE EXTINGUISHERS.—Of these there is a large variety, each with its advocates. As the apparatus occupies but little space, is extremely portable, and can be made available at a moment's warning, these extinguishers have been extensively introduced for the purpose of subduing small fires, and thereby preventing larger ones. Ordinarily the water is charged with carbonic acid, but other substances are also used.

The fire extinguisher, commonly so termed, is a metal cylinder with a capacity of about a quarter of a barrel. Straps are fastened on either side for the insertion of the arms. It is carried on the

back, the straps passing over the shoulders and under the arms. A short hose is attached, with a nozzle throwing a small stream.

In some varieties, there are two vessels, one containing a bicarbonate, the other a strong acid, sometimes oil of vitriol. These are contained within a larger cylinder containing water. When wanted for use the contents of the two smaller vessels are thrown into the water, carbonic acid gas is set free, and is absorbed by or dissolved in the water, and the whole is immediately ready for use.

In some machines other agencies are used. By opening a suitable valve in the hose or outlet, the confined gas forces out the liquid in a strong jet while yet heavily charged with carbonic acid gas,

which being non-combustible materially assists the action of the water as an extinguisher.

Another, the "Babcock," has its cylinder filled with a solution of bicarbonate of soda, with a vessel of acid suspended in its upper part. This smaller vessel has a stopper, which, being withdrawn, causes the vessel to tilt over, and the escaping acid mingling with the solution discharges the carbonic acid under heavy pressure.

The transition from the small extinguisher to one large enough to necessitate carriage by wheels and drawn by horses, was easy and natural. In

order to provide against the contingency of exhaustion of a cylinder and the apparatus becoming thereby temporarily worthless, as at large fires, an additional cylinder was added, so that while one is in use the other may be resupplied with the necessary chemicals.

Grenades or bombs are small glass spheres readily fitted to convenient places in halls, rooms, offices, etc., and are intended to be thrown by hand against the portions of the structure on fire, thus breaking the glass and liberating the contents for extinguishing the flames.

WATER TOWER.

CHEMICAL FIRE ENGINE.

FIREFLY, a name applied to many "phosphorescent" insects, which are all included within the order Coleoptera, or beetles. Some of them (among the Elaters) give forth a steady light, and these may be distinguished as fireflies proper from the Glow-worms and "lightning-bugs" (among the Lampyridæ), which flash light intermittently. In the phosphorescent Elateridæ, furthermore, the production of light has its seat more anteriorly than in the Lampyridæ, where it is abdominal.

The most brilliant fireflies are species of *Pyrophorus*, most at home in tropical America. One

form—*Pyrophorus noctilucus*—common in the West Indies and Brazil, attains a length of about an inch and a half, and has a dark rusty-brown color. On the upper surface of the first ring of the thorax are two yellowish oval spots which are brilliantly luminous during the nocturnal activity of the beetle, while on the first ring of the abdomen a still brighter organ is situated. The luminous organs are special modifications of the epidermic cells, which are disposed in two layers, of which the outer alone is luminous. The luminosity depends on a process of oxidation; the oxygen is

supplied by the tracheæ, and the brilliancy varies with the respiratory activity. What the substance oxidized really is remains undiscovered.

The light of these living lamps, or *cucujos*, as the Mexicans call them, has frequently saved a traveller's life; the Indians "travel in the night with fireflies fastened to their hands and feet, and spin, weave, paint and dance by their light," and they are often used for decorative purposes. A few of them in a glass vessel give light enough to read by, and when not wanted for any such purpose they may be set to catch mosquitoes.

FIRE-HOLE RIVER, or main fork of Madison River. It flows from Madison Lake northwest through Fire-hole Basin, one of the most remarkable regions of the National Park, in the State of Wyoming.

FIRE ISLAND, a small island in Great South Bay, L. I., belonging to Suffolk county, N. Y. It is a favorite summer resort. Fire Island Beach, 30 miles long, with a fine light-house, separates Great South Bay from the Atlantic. Here incoming European vessels are sighted and the news telegraphed to New York city.

FIRELESS ENGINE, a successor to Dr. Émile Lamm's ammoniacal gas engine. The ammonia engine was successfully used in propelling street-cars in New Orleans in 1871, but was superseded by the incidental discovery, by Dr. Lamm, of a convenient method of using detached steam for the same purpose. The fireless engines, each towing one car, are charged with detached steam from stationary boilers, and run $5\frac{1}{2}$ miles in a half hour, working the pressure from 135 pounds to 60. They are very easily managed. The fireless engine now in use in New Orleans was patented in 1872. Similar locomotives are used in the suburbs of Paris, and at other points in France under the name of Lamm and Franqz System.

FIRELOCK, the name applied on its introduction, in 1690, to the old musket which produced fire by the concussion of flint and steel. Writers of the early part of the 18th century called firelocks 'asnaphans, a word obviously corrupted from the Dutch *snaphaan*. The weapon was superseded about 1830 by the percussion musket, which, in its turn, has yielded to the rifle.

FIRE-PROOFING, the treatment of combustible materials which renders them fire-proof. Attempts to render cotton, linen, and other textile fabrics, timber, etc., incombustible have to the present time been but partially successful. All that can be done to protect them is the prevention of conflagration; no process yet known can prevent smouldering. The best protection of textile fabrics is saturation with various salts, such as leave their crystals in the substance of the fabric. The most efficient protection to wood is silicate of soda. If planks of moderate thickness be brushed over several times on each side with a strong solution they will burn only on being subjected to intense heat. The protection is owing to the fusion of the silicate, which forms a glass enveloping the surface, thus sealing it from the oxygen of the air.

FIRE-SHIP, a vessel, usually an old one, filled with combustibles, sent in among the hostile squadron, and there fired, in the hope of destroying some of the ships, or at least producing great confusion.

FIRE-WEED, the popular name of several plants: the *Erechtites hieracifolia* of North America, often four or five feet high, very troublesome in and around spots where brushwood has been burned; the *Epilobium angustifolium* or *spicatum*, commonly called the great willow-herb, a tall perennial, bearing a spike of showy rose-purple

flowers; the *Erigeron Canadensis*, or common horse-weed, a troublesome weed, native to the United States, but widely naturalized in other countries; and the *Plantago media*, the English hoary plantain, or lamb's tongue, whose broad, low leaves stifle growing crops.

FIRKIN, a measure of capacity, generally the fourth part of a barrel. It is also a small wooden cask or barrel, used chiefly for butter, suet, tallow, etc.

FIRKOWITSCH, ABRAHAM, a Jewish archaeologist, born at Lutzk, in the Crimea, Sept. 27, 1786, died at Tshufut-Kale, in the Crimea, June 7, 1874. He was a Karaites, and devoted himself to collecting manuscripts and works in support of the teachings of the Karaites. He published accounts of his work in *Massa-u-Meriba* (1838) and in *Abne-Lik-karon* (1872). His large collection of manuscripts was purchased for the imperial library at St. Petersburg.

FIRLOT, an old Scotch dry measure, of which there were four in a boll; though differing in value for different substances and places, its relation to the boll remained invariable.

FIRMAMENT, a word formerly used to signify the vault of heaven. It was regarded as a solid crystal sphere to which the stars were fixed, and which was constantly revolving, carrying them with it. In the progress of astronomical observation it was found that many of the heavenly bodies had independent motions, inconsistent with the notion of their being fixed to one sphere or firmament. Then the number of crystalline spheres was increased, each body that was independent of the rest having one assigned to it. This introduced a complex system, fully understood only by the philosophers who formed the theory.

FIRMAN, a word of Persian origin, signifying an order, and used by the Turks to denote any official decree emanating from the Ottoman Porte. The right of signing any firman relating to affairs connected with his special department is exercised by every minister and member of the divan; but the office of placing at the head of the firman the *thograï*, a cipher which contains the name of the sultan in interlaced letters, and which alone gives effect to the decree, is committed to the hands of a special minister who is called *nichandji-effendi*. A written permission to trade is called in India a firman.

FIRST-BORN (Heb., *bekor*; Gr., *prototokos*; Lat., *primogenitus*): in Scriptural use, the first male offspring, whether of man or of other animals, due to the Creator, by the Mosaic law, as a recognition of his supreme dominion. The first-born male child being devoted from the time of birth to God, was to be redeemed within one month after birth by an offering not exceeding in value five shekels of silver (Exod. xiii, 13). The headship of the family was vested in the first-born son by the Mosaic law, and he had a double portion of the inheritance.

FIRST-FRUITs, that portion of the fruits of the earth which, by the use of the Jews and other ancient nations, was offered to God as an acknowledgment of His supreme dominion, and as a thanksgiving for his bounty.

FIRWOOL, a fibrous substance prepared to some extent from the leaves of various species of the genera *Pinus* and *Abies*, and made into cloth which is believed to be useful in the treatment of skin diseases. Fir-wool extract and fir-wool oil are prepared from leaves of the same species of fir.

FISCHER, ERNST KUNO BERTHOLD, a German philosopher, born in the Silesian village of Sandewalde, July 23, 1824, and educated at Posen, Leipzig, and Halle, taking his degree of Ph. D. at the latter place in 1847. In 1850 he established him-

self as a privatdocent of philosophy at Heidelberg, where he became exceedingly popular. Suddenly, however, in 1853, presumably because of private charges of pantheism made against the first volume of his *History of Modern Philosophy*, the Baden government, without explanation, deprived him of his position. In 1856 he received a call to the chair of philosophy at Jena, where he remained until 1872, in which year, Zeller having succeeded Trendelenburg at Berlin, he obtained Zeller's post at Heidelberg. Fischer's chief work is his great history of modern philosophy, *Geschichte der Neuern Philosophie* (1852-77). His other great philosophical achievement is his *System der Logik und Metaphysik* (1852; new ed., 1865). Of his smaller works the most noteworthy is a *Critique of Kant*, which, like *Descartes and His School*, has been translated into English.

FISH. See *Britannica*, Vol. XII, pp. 630-695.

FISH COMMISSION, a bureau of the United States government, which was established in 1871, for the purpose of promoting the fishing industries of the country by the propagation and distribution of useful fishes and by investigations with regard to their habits, fitness for food, etc. The Commission is carefully subdivided and has experts to take charge of the many different subjects submitted to them and make painstaking scientific research the basis of all practical work. Their efforts are greatly aided by State fish commissions which are established throughout the country.

FISH CULTURE. See *Britannica*, *PISCICULTURE*, Vol. XIX, pp. 126-129; also in these Revisions and Additions.

FISHERIES QUESTION, THE. Before the war of 1812 complaints had been made by British fishermen that the best places for drying and curing fish on the Canada coasts were occupied by United States fishermen, who were protected by the treaty of 1783. Article III of that treaty stipulated that fishermen of the United States should have the "right" to fish on the banks of Newfoundland and in the Gulf of St. Lawrence, and the "liberty" to take fish on all the coasts of British North America; also they were "to have the liberty to dry and cure fish in any of the unsettled bays, harbors and creeks of Nova Scotia, Magdalen Islands and Labrador." This treaty, the British government maintained, had been abrogated by the war of 1812; while the United States regarded it as a convention of separation dividing between the two countries property formerly held by them in common, to which their claim was at least equally strong, as the fisheries had been wrested from France and developed mainly by the colonists. The British government also contended that while the treaty of 1783 recognized the "right" to fish on the high seas it granted Americans only the "liberty" to fish on the coasts, and to dry and cure their fish in British waters. In 1818 a treaty was negotiated by which the United States "renounced forever" the liberty "to take, dry, or cure fish on or within three marine miles of" certain "coasts, bays, creeks, or harbors," while in other designated places they should enjoy that "liberty" "forever." The term "renounce" was insisted upon by the American negotiators, Albert Gallatin and Richard Rush, for three reasons: "To exclude the implication of the fisheries secured to us being a new grant; to place the rights secured and renounced on the same footing of permanence; that it might expressly appear that our renunciation was limited to three miles from the coast." It was also provided, with regard to the bays and harbors renounced, that "American fishermen shall be admitted to enter such bays or harbors for the

purpose of shelter, and of repairing damages therein, of purchasing wood and of obtaining water, and for no other purpose whatever. But they shall be under such restrictions as shall be necessary to prevent their taking, drying, or curing fish therein, or in any other manner abusing the privileges hereby reserved to them." Even this treaty, however, did not prevent trouble, and fishing vessels were frequently seized, and some were condemned, for infringing the three-mile limit. The Nova Scotians held that this three-mile measure should be taken from headland to headland and that American fishing vessels should not enter bays or harbors unless in actual distress. The "hovering act" was passed by the Nova Scotia legislature in 1836, and since by the Dominion of Canada, which forbade foreign vessels to linger within three marine miles of the coast; and strained relations existed between the nations until 1854, when a reciprocity treaty was concluded with the Dominion, under which peace and security came to the American fishermen, and the inshore fisheries were again thrown open to them. This treaty terminated in 1866, and a satisfactory system of licensing American fishing vessels was then instituted by the Canadian government.

In 1870, however, foreign fishermen were again excluded from Canadian waters, and immediately the old controversies as to headlands and trespass were renewed, until the treaty of Washington, concluded in 1871, provided in its fishery clauses for a free market in the United States for Canadian fish and for free fishing in Canadian waters for United States fishermen, and amicable relations were once more restored. Salmon and shad fisheries, and all other in the mouths of rivers, were reserved for British subjects, and certain "places reserved from the common right of fishing" in the treaty of 1854 were excepted from the operation of the treaty of Washington, and a commission was appointed to decide what, if any, compensation should be made to the Canadians for the privileges secured by the treaty to the American fishermen. This commission sat at Halifax in 1877, and decided that the advantages to the United States were of greater value than those conceded to the Canadians, and the sum of \$5,500,000 was awarded to the British government.

This treaty of Washington was terminable after eleven years by either party giving two years' notice, and such notice was given in 1883 by the United States Government, in accordance with a resolution to that effect adopted by Congress. A *modus vivendi* was negotiated between the British minister and Secretary Bayard, by which the inshore fishing privileges were continued to the American fishermen until the end of the season of 1885, in consideration of the President's suggesting in his message to Congress the creation of a commission "to consider the general question of our rights in the fisheries and the means of opening up to our citizens, under just and enduring conditions, the richly stocked fishing waters and sealing grounds of British North America." The terms used were thought to point toward the adoption of reciprocity; and Mr. Maybury, of Michigan, introduced a proposal in the House of Representatives requesting that the President open negotiations for a renewal of the treaty of 1854, but no action was taken. The President's recommendation was rejected by the Senate, on the ground that the treaty of 1818 was all that was required. But disputes were constantly arising as to the construction of the terms of this treaty. Canada claimed under it that any American fishing vessel found in Canadian waters for any purpose but repairs, shel-

ter, food or water was forfeited. This claim was denied by the United States, and a considerable party there were in favor of retaliation for annoyances caused by this view of the treaty. A "responsive" measure was suggested, authorizing the President at his discretion to close our ports to Canadian vessels, and prohibit the importation of Canadian merchandise. Eventually a conference was arranged, to be held at Washington, at which all vexed questions should be discussed, and if possible some amicable and lasting conclusion arrived at with regard to outlines and boundaries, modes of preventing unjust seizure and detention of vessels, the question of obtaining bait and supplies, and also the question of payment of damages resulting from wrongful acts of officials. The members of this conference were Sir Charles Tupper, Canadian plenipotentiary, the Right Honorable Joseph Chamberlain, M. P., British commissioner, and Sir Lionel West, representing British views, and with Secretary Bayard, Messrs. William L. Putnam, of Maine, and President James B. Angell, of Michigan University, were associated to guard American interests. The conference was opened in Washington in November, 1887, and on February 15, 1888, a treaty was signed, subject to ratification or rejection by the United States Senate within two years. It was rejected by that body on Aug. 21, 1888.

For an account of the Bering Sea fisheries question, see SEALS and SEAL FISHERIES, in these *Revisions and Additions*, also *BERING SEA*.

FISH: in naval terms, an apparatus of pulleys employed in dragging the flukes of the anchor towards the bow after it has been hoisted to the cat-head. *Fish-front* is a long piece of oak, or fir, convex without, concave within, securely fastened on the injured portion of a sprung mast or yard, to which it imparts rigidity.

FISH CULTURE. See *Britannica*, Vol. XIX, p. 126.

FISHERMAN'S RING (*Annulus piscatorius*), a seal-ring bearing the device of St. Peter fishing, and worn by the popes as St. Peter's successors. It has been employed since the 13th century, and is used to seal certain briefs. The origin of the custom is not known.

FISH-HAWK. See *OSPREY*, *Britannica*, Vol. XVIII, p. 56.

FISH, HAMILTON, an American statesman, born in 1808. He was admitted to the bar in 1830, and for several years was a commissioner of deeds. In 1842 he was chosen a representative in Congress. In 1847 he was elected lieutenant-governor of New York, and in 1848 became governor. In 1851 he was chosen United States Senator, and in 1869 was appointed Secretary of State by President Grant. In 1873 he was reappointed, serving through Grant's administration.

FISH, NICHOLAS (1758-1833), an American soldier. In 1776 became aid-de-camp to Gen. Scott; the same year major of brigade, and then major of the 2d New York regiment. At the close of the war he was a lieutenant-colonel, and in 1786 became adjutant-general of New York State, holding the office for many years. In 1794 he was supervisor of revenue under Washington, and in 1806-17 was a New York alderman.

FISHER, GEORGE JACKSON, an American physician, born in 1825. He began practice in 1849, and in 1853-54 was physician and surgeon to the New York State-prison at Sing Sing. For twenty years he was United States examining surgeon, and in 1874 was president of the State Medical Society. He wrote many works on anatomy, surgery, and medicine.

FISHER, GEORGE PARK, an American theologian, born in 1827. He studied theology in the United States and Germany, was called to the professorship of divinity in Yale, and from 1854 to 1861 was pastor of the college church. In the latter year he was chosen professor of ecclesiastical history in Yale Divinity School. In 1866 he became one of the editors of the "New Englander." He is the author of numerous works on ecclesiastical topics.

FISHES, ROYAL. The sturgeon or whale, when thrown on the shore or caught near the coast, are, in British law, the property of the crown. See *Britannica*, Vol. IX, p. 268.

FISH-LOUSE, a name applied to any of the Copepod crustaceans which occur as external parasites both on fresh-water and marine fishes. Some have also been found on amphibians. To the zoölogist they have a special interest on account of the degeneration which they often exhibit, when contrasted with their free-living relatives, or even with their own young stages.

FISK, or *Fisco*, a term found in Scottish law books. It is derived from the Latin *fiscus*; literally, a wicker basket, which came ultimately to signify the private purse of the emperor, and distinguished from the public treasury, which was called *ararium*. In Scotland it usually signifies the crown's revenues, to which the movable estate of a person denounced a rebel was formerly forfeited.

FISK, CLINTON BOWEN, an American general, born at York, N. Y., in 1828, died in 1890. In 1830 he was taken to Michigan, where his father founded the town of Clinton. He was educated at Albion and Ann Arbor, and afterwards settled in business at Coldwater. He entered the army in 1861, and rose rapidly to the rank of brevet major-general. After the war he was a commissioner of the Freedman's Bureau, and founder of Fisk University. From 1874 until his death he was president of the Indian Commission. He was prominently connected with many educational and religious institutions. In 1888 he was the candidate of the Prohibition party for President of the United States.

FISK, WILBUR (1792-1839), an American clergyman and educator. He was licensed to preach in the Methodist Episcopal church in 1818; in 1822 was ordained deacon, and from 1823 to 1827 was presiding elder of that part of Vermont east of the Green Mountains. In 1826 he was chaplain of the Vermont legislature, and from 1826 to 1831 was principal of the Wesleyan Academy in Wilbraham, Mass. In 1830 he was elected the first president of Wesleyan University. In 1836 he was in England and represented the M. E. church at the Wesleyan conference, and in 1839 he became a member of the board of education of Connecticut. His publications are principally theological and educational works.

FISKE, JOHN, an American author, born in 1842. In 1864 he was admitted to the Connecticut bar, but never practiced. From 1869 to 1871 he was lecturer on philosophy at Harvard; was instructor in history in 1870, and from 1872 to 1879 was assistant librarian. In 1879, and again in 1885, he was chosen a member of the board of overseers. Since 1884 he has been professor of history in Washington University, St. Louis, Mo. His works are principally on history, and on the doctrine of evolution.

FISSIROSTRES, one of the classes of birds into which the great order *Insectores* is divided. It is characterized by peculiar width of gape, and the bill is depressed or horizontally flattened, short,

and often furnished with strong bristles at the angles. The birds of this tribe are insectivorous, and generally subsist by catching insects on the wing, to which their structure of bill is beautifully adapted. Their powers of flight are generally great, but their legs are short and weak. Swallows, goat-suckers, etc., are examples of this order.

FISTULINA, a genus of fungi, allied to *Boletus*, common on old oak and various other trees. Its color is red, its substance fibrous and fleshy, much resembling beet-root. This fungus is much esteemed in some parts of Europe and America, as an esculent; it is wholesome and nutritious.

FITCH, ASA (1809-1879), an American naturalist. For a time he practiced medicine, but from 1838 devoted himself entirely to scientific agriculture and the study of natural history. In 1854 he was made New York State entomologist.

FITCHBURG, a city of Massachusetts, and county-seat of Worcester county (see *Britannica*, Vol. IX, p. 270). The growth of the city during the last decade has been considerable. A well-equipped fire department has been established, with 60 telegraphic fire-alarm stations. There were in 1890 12 churches and 24 school buildings, the latter being valued at \$275,000. A public library and art gallery building, costing \$90,000, has been donated to the city by one of its public spirited citizens, and another has given \$450,000 for the establishment and endowment of a public hospital. The library contains 22,310 volumes. Manufacturing is carried on extensively, the principal establishments being paper mills, machine shops, iron foundries, saw factories, cotton, woolen, and flour mills, shoe factories, wood-turning establishments, and shirt factories. Population in 1880, 12,429; in 1890, 22,037.

FITCHY. Crosses are said to be fitchy in heraldry when the lower branch ends in a sharp point. Crosses are supposed to have been so sharpened to enable the primitive Christians to stick them into the ground for devotional purposes.

FITZ, an old Norman word signifying "son," like the Scotch *Mac*, the Irish *O'*, and the Oriental *Ben*. It is prefixed to proper names to signify descent; as in the Norman names Fitzwilliam, Fitzwalter, etc. A later application of it has been to denote the natural sons of royalty, as in Fitzroy, Fitzjames, etc. The Russian termination *witch* is a Slavonic form of the same word.

FIVE FORKS, a locality in Dinwiddie county, Va., where an important battle was fought April 1, 1865, between Confederate troops and the army under Gen. Sheridan. The Union forces were victorious.

FIVE ISLANDS, a village of Colchester county, N. S., on the Basin of Minas. It possesses much mineral wealth; a remarkable cataract 90 feet high; manufactures baryta paint, and builds ships.

FIXING, in Photography. When a picture has been obtained through the agency of light, by the exposure of a sensitive surface suitably prepared, and the subsequent development of the latent image, there remains in the deepest shadows of the picture a portion of the sensitive material, unacted upon by light. The removal of this unaltered sensitive material by an appropriate solvent is termed fixing, though the term clearing would perhaps be preferable, fixing being more strictly accurate in the case of the daguerreotype process, where the picture is fixed to the silver-plate by the deposition of a film of metallic gold.

FLACOURTIACEÆ, a natural order of exogenous plants, allied to Passion Flowers, and consisting of shrubs and small trees, almost exclusively confined to the tropical regions. Many of

the species produce pleasant, sweet, or subacid fruits. Arnott is produced by a tree of this order.

FLAG, THE AMERICAN. Prior to the separation of the American colonies from England, the flags used were generally those of the mother country; but in 1774 Captain Markoe, of the Philadelphia Light Horse, used a flag with a canton of 13 stripes. In the latter part of 1775 Dr. Franklin and Messrs. Lynch and Harrison were appointed to consider the subject of a National flag. The result of this conference was a flag like that of the East India Company and the Sandwich Islands—the King's colors or Union Jack, representing the yet recognized sovereignty of England, with a field of 13 stripes, alternate red and white, emblematic of the union of the 13 colonies. The new flag was hoisted for the first time, Jan. 2, 1776, over the camp at Cambridge. When Independence was determined on, the British Jack was dropped, and thirteen stars substituted, representing a new constellation. Nothing further of importance was done on the question of a National flag until April 4, 1817, when Congress enacted: (1) That from and after the 4th of July, 1818, the flag of the United States be 13 horizontal stripes, alternate red and white; that the union be 20 stars, white in a blue field. (2) That on the admission of every new State in the Union, one star be added to the union of the flag; and that such addition shall take effect on the 4th day of July then next succeeding such admission. The first flag unfurled under the new law was hoisted over the United States House of Representatives, April 14, 1818. The law of 1817 remains unchanged to the present day, and hence the national flag is now composed of 13 horizontal stripes, alternate red and white, and a cluster of 44 white stars on a blue background.

FLAG, a genus of plants. See *Britannica*, Vol. IX, pp. 279-80.

FLAG-CAPTAIN, in the navy, the captain of the admiral's ship in any squadron, and ordinarily his nominee.

FLAG-LIEUTENANT, an officer who, in the navy, performs such duties for an admiral as would devolve upon an aid-de-camp in the army. He communicates the admiral's orders to the various ships, either personally or by signal.

FLAGEOLET-TONES, a name given to the harmonic notes of the violin, violoncello, and other stringed instruments, which notes are produced by the finger lightly touching the string on the exact part which generates the harmony. The string vibrates on both sides of the finger, the long side dividing itself into parts of the same length as the short side.

FLAGET, BENEDICT JOSEPH (1763-1850), a French-American R. C. bishop. He was ordained priest in 1788, and in 1792 came to the United States. He was at once sent as chaplain to Vincennes, Ind., then a military post in the Northwest. From 1795 to 1798 he was a professor at Georgetown College, and for the next three years was in Havana as a tutor to the sons of a wealthy Cuban. From 1801 to 1808 he was engaged in duties at Georgetown College and in missionary labors, and in the latter year was appointed bishop of Bardstown, Ky. During his life he erected numerous colleges and convents, some of which were built at his own expense.

FLAGG, GEORGE WHITING, an American artist, born in 1816. He studied in the United States, then spent several years in Europe, and subsequently settled in New York city. His productions comprise historical and genre pictures, and some portraits, all of which have been favorably received.

FLAGG, JARED BRADLEY, an American artist, brother of George Whiting Flagg, born in 1820. He settled in New York city, and pursued the study of theology in connection with that of art, and in 1854 entered the ministry of the Protestant Episcopal church. For ten years he devoted himself to ministerial duties, and then gave himself up to painting. He produces some ideal figure-pictures, but makes a specialty of portraits.

FLAGG, WILSON (1805-84), an American naturalist. For a time he wrote for the "Boston Weekly Magazine" and the "Boston Post" on political subjects, and then turned his attention to the agricultural journals. From 1844 to 1848 he was employed in the Boston custom-house. In 1856 he settled in Cambridge, Mass., and resided there until his death. He was the author of many valuable works on natural history.

FLAG OF THE PROPHET, the sacred banner of the Mohammedans. It was originally white, and was composed of the turbans of the Koreish captured by Mohammed. A black flag was, however, soon substituted in its place, consisting of the curtain that hung before the door of Ayesha, one of the prophet's wives. This flag is regarded by the Mohammedans as their most sacred relic.

FLAGS, pieces of thin, light material, usually bunting, of various colors, shapes and sizes, and sometimes with elaborate and curious designs, hoisted in conspicuous places and hanging free from poles or flag-staffs, capable of being extended by the wind, and designed to make known some fact or want to the spectators. For a history of what may be called the evolution of the modern standard or ensign, see *Britannica*, Vol. IX, pp. 276-279.

OBJECT AND USES OF A FLAG.—The primary object of a flag is to denote nationality. This is its principal use at sea, in order that the commander of a vessel may show to what country his ship belongs, "under what flag it sails." It is displayed—not on the mast-head, however, that position being reserved for the flag of the country to which the vessel is bound, or for other signal—but at the gaff, and its position shows the state of affairs on board: if it be at half mast a death has occurred; if it be reversed, assistance is needed. When saluting, it is "dipped"—lowered and hoisted again—in token of respect, and it is "struck," or lowered permanently in token of surrender. Besides the national flag, flags of one color are used with one meaning all the world over: a white flag being the emblem of peace or a truce, a black flag of a pirate, and a yellow flag of dangerous sickness or quarantine. Flags of different shapes and of varied devices are also used in combinations, guided by a formulated code, which make extended communications practicable with a limited number of flags. On land their use is, of course, of a different character. In military use the terms differ for the various signal flags, and generally show their French origin.

THE GOVERNMENTAL FLAGS OF THE UNITED STATES are the standard, the pennant, the revenue service flag, the President's flag, and the flags of rank in the navy. The pennant, or whip, is a long strip of bunting which flies at the mast-head of a ship in commission. The custom-house flag displays the shield, the stars, the eagle, and the stripes—all the national emblems. The jack shows the "union" only. It is hoisted on the bowsprit cap in port, and when at the fore means that a pilot is wanted. Ships, which in an emergency, may be put in commission by the Government, fly the flag of the naval reserve. "Blue Peter"—a name which is a corruption of "blue repeater"—is hoisted by a British vessel which is ready for sea. It recalls

officers and seamen who may be on shore or off in boats, and implies that a pilot or perhaps more seamen are needed, though the Union Jack is the pilot flag, as with ourselves.

FLAGS OF RANK IN THE NAVY.—Of the flags of rank in the United States navy those of admiral and vice-admiral will not be required unless the offices are recreated by Congress, rear-admiral being now the highest grade in the United States navy. In 1862 the grade of rear-admiral was created, in 1864 that of vice-admiral, and in 1866 that of admiral, in recognition of the services to the Government rendered by Farragut. When he died, in 1870, the rank was conferred on Vice-Admiral Porter, and it died with him; just as the rank of general became extinct with the deaths of Grant, Sheridan, and Sherman. The President's flag is carried at the main of a ship of war which carries the President, and at the bow of his barge when he is on board.

NATIONAL STANDARDS.—A national standard is usually the result of circumstances or the embodiment of ideas that arouse the enthusiasm of those to whom it belongs, so that they will perform deeds of valor, imperiling life itself in its defense and in defense of the principles it represents. This has been shown in the history of nearly every country and every people in the world, but not every one can sympathize with the fanaticism said to be excited by the exhibition of the standard of Islamism, the "flag of the prophet," to his followers when it is thought they require such excitement at the beginning of or during a war. With the progress of improvements in the art of war, and in making weapons and ornaments, the extension of civilization, and the tendency to settle international difficulties by arbitration before instead of after hostilities, the use of flags as war signals bids fair soon to become matter of history. Still this has been one of their chief uses in the past, and is one of the causes of the veneration or dislike, as the case may be, with which they are regarded. The heraldic devices borne on some of them, grotesque as they seem at the first glance, convey a history of triumph to some and to others a record of defeat and subjugation. In other cases the combination of armorial bearings shows where amicable alliances have been made, while others bear no device, as that of Morocco, which is a plain red flag; and "the flag of the prophet," to which allusion has been made, is black, and was originally the curtain of a tent. One of the most striking of national ensigns is the British, on which the arms of England, Scotland, and Ireland are quartered. On the flags of those countries where Mohammedanism prevails, a crescent is displayed, as those of Christian nations show a cross. The national flag of Mexico shows an eagle with a snake in his beak. The national emblem of China, the dragon, is shown blue on a yellow flag. Flags of this nation vary according to fancy, but always have fringed or scalloped edges. The lion appears on the Persian standard, in front of the rising sun; the elephant on that of Siam, and eagles, armed and unarmed, double and single-headed, crowned and uncrowned, with globes and crosses and other insignia inherited from past ages, appear on those of Russia and Germany. Such ensigns fly over the residences, temporary or permanent, of reigning sovereigns or of members of the royal families, afloat or ashore.

Changes in governments, if radical, cause changes in the national emblems, the lilies having disappeared from the French as the Bourbons from French politics, and the keys of St. Peter from the Italian with the unification of Italy, and the

disappearance from the political map of the States of the church. In our own flag it is provided by law that an additional star be added for each State admitted to the Union—the number of stripes remaining unchanged to show from what it has grown. In the years 1889-90 six States were admitted, making 44 the number of stars required in the national flag of the United States.

SIGNAL-SERVICE FLAGS.—The meteorological department of the signal service has a suit of flags for each of its three divisions: cautionary, storm, and weather signals. These are displayed at necessary or appropriate stations on the sea-board or in the agricultural districts, and form a very useful and popular branch of the service. A Weather Bureau was created in the Department of Agriculture by act of Congress in 1880, and the meteorological duties formerly devolving upon the United States Signal Service were transferred to it in 1891 from the War Department, of which it had since its adoption in 1870 been an adjunct.

FLAG-SHIP, the ship in a fleet which bears the admiral's flag, and therefore forms a sort of center to which all other vessels must look for orders. It is usually the largest vessel in the fleet.

FLAGSTONE, a rock which splits into tabular masses, or flags of various size and thickness, in the original planes of stratification. Flagstones are generally sandstones combined with more or less argillaceous or calcareous matter; some, however, are indurated clays, and others thin-bedded limestone.

FLAMBOROUGH HEAD, a promontory of the Yorkshire coast, forming the northern boundary of Bridlington Bay. It terminates a range of white perpendicular chalk cliffs 6 miles long, containing fossil sponges, crinoids, etc. On the head is a light-house 214 ft. high.

FLAMINGO. See *Britannica*, Vol. IX, p. 286.

FLAMINIAN WAY (*Via Flaminia*), the great northern road of ancient Italy, leading from Rome to Ariminum (Rimini) on the Adriatic. It was constructed by C. Flaminius during his censorship (220 B. C.), in order to secure a free communication with the recently conquered Gaulish territory. When Augustus (27 B. C.) appointed persons of consular dignity road-surveyors for the other highways of his dominions he reserved the care of the Flaminian Way for himself, and renewed it throughout its whole length.

FLAMMARION, CAMILLE, a French astronomer, born at Montigny-le-Roi, Feb. 25, 1842; entered the Paris Observatory in 1858, and became a popular lecturer on astronomy. Retiring in 1865, he devoted himself to the popularization of science in periodicals and books. His principal publications are: *The Plurality of Inhabited Worlds* (1862; 30th ed. 1884); *Imaginary Worlds and Real Worlds* (1864; 19th ed. 1884); *God in Nature* (1866; 18th ed. 1882); *Celestial Marvels* (1865); *Studies and Lectures on Astronomy* (1866-81; 9 vols.); *History of the Heavens* (1872); *The Atmosphere* (1872); *The Stars and the Curiosities of the Heavens* (1881); and *The Lands of the Heavens* (8th ed. 1882). Flammarion made many balloon ascensions for the study of aerial phenomena, and published a work entitled *Travels in the Air*. In 1892 M. Flammarion took a deep interest in the observations of the planet Mars and was among those who held that communication between the earth and our nearest celestial neighbors is not impossible.

FLANDERS, HENRY, an American lawyer, born in 1826. He studied law with his father, Charles Flanders, and in 1850 settled in Philadelphia, where he has since resided. He is the author of several well-known treatises on various kinds of law.

FLANGE, a rim or projection upon a tube or cylinder of metal or other material, to serve as a bearing or afford means of fixing it; for example, the projecting rim on the tires of the wheels of railway-cars is called a flange.

FLAT, a musical character, which, when placed before a note, lowers that note half a tone. When placed at the beginning of a piece of music it denotes that all the notes on the line or space on which it is placed, with their octaves above and below, are to be played flat.

FLATTERY, CAPE, a promontory on the east coast of Australia, in latitude 14° 52' south, and longitude 154° 20' east. It is about thirty miles to the north of Endeavor Bay.

FLAUBERT, GUSTAVE, born at Rouen, France, December 12, 1821; died May 9, 1880. He belonged to the realistic school of novelists, and is well known in America by his *Madame Bovary* and *Salammbô*, which have been translated and extensively circulated.

FLEABANE, a genus of plants of the natural order *Compositæ*, sub-order *Corymbifera*, having hemispherical imbricated involucre and yellow flowers, the whole plant emitting a peculiar aromatic smell, sometimes compared to that of soap, which is said to be efficacious in driving away fleas. It has considerable reputation for medicinal purposes.

FLEAWORT, the *Plantago Psyllium*, a kind of plantain of Europe and Barbary. The seeds, *Semen psyllii*, are mucilaginous, and are sometimes used for the same purposes as flax-seed.

FLECHE, LA, a town of France, in the department of Sarthe, on the Loire. On an island in the Loire, which separates the town from its suburbs, are the remains of an ancient castle. It has manufactures of leather, paper, gloves, linen and hosiery. Population, 7,468.

FLEET PRISON, a celebrated London jail, which was the king's prison as far back as the 12th century. In the 16th century it acquired a high historical interest as the prison of the religious martyrs of the reigns of Mary and Elizabeth. The buildings were demolished in 1845-46, and part of the site is now occupied by the Congregational Memorial Hall.

FLEMING, SANDFORD, Canadian engineer, was born in Scotland, Jan. 7, 1827. He removed to Canada in 1845, and in 1852 was on the engineering staff of the Northern Railway, and afterwards one of the chief promoters of the railway from the Atlantic to the Pacific. The first link in this chain was formed by the Inter-Colonial Railway, undertaken by Mr. Fleming at the request of the governments of Canada, Nova Scotia and New Brunswick, in conjunction with the Imperial authorities. July, 1876, saw the completion of this great work, an historical account of which Mr. Fleming published in the same year. While the "Inter-Colonial" was being constructed Mr. Fleming was ordered to survey and locate the line for the Pacific Railway, a task which he partly accomplished in 1872. For the next seven years he actively prosecuted that enterprise, and for his services was knighted in 1877. In 1880 he was elected Chancellor of Queen's University, Kingston, Ontario, a position to which he has thrice been re-elected since, and which he still holds. In 1884 he represented the Dominion at the International Prime Meridian Conference at Washington.

FLEMINGSBURG, the county-seat of Fleming county, Ky. It has a college, distilleries, Masonic and Odd Fellows' Hall. Population, 1,172.

FLEMINGTON, a railroad junction of New Jersey, and county-seat of Hunterdon county, situated

in a rich agricultural district 50 miles southwest of New York city.

FLEMINGTON, a village of Taylor county, in the northeastern part of West Virginia. Here is the West Virginia College (Free-will Baptist).

FLESH-FLY (*Musca vomitoria*), an insect of the same genus as the house-fly, which it much exceeds in size. The forehead is rust colored, the thorax grayish, the abdomen blue with three black bands; the expanse of wings nearly one inch. It deposits its eggs on flesh; the maggots are of very frequent occurrence on meat in summer, notwithstanding all care that can be taken. There are several allied species.

FLETCHER, ALFRED, an English journalist, born at Long Sutton in 1841, and educated at Manchester and Edinburgh. He edited the "Cyclopædia of Education," and has been connected as correspondent with several prominent periodicals. In 1878 he joined the staff of the London "Daily Chronicle," and in 1890 became its editor.

FLETA, the title of an early treatise on the law of England, presumably written about 1290 by a judge who was confined in the Fleet Prison.

FLETCHER, JOHN, originally *De la Fléchière*, born at Nyon, Switzerland, Sept. 12, 1729, died Aug. 14, 1785. He was educated at the University of Geneva, and at the age of 23 went to London to perfect his knowledge of the English language. He was ordained a minister of the Established Church in 1757, and became an able coadjutor of the Wesleys. In 1760 he settled as vicar of Madeley, and in 1771 the Countess of Huntingdon appointed him president of her theological school at Trevecca, Wales. The latter position Mr. Fletcher resigned upon being required to disavow Wesley's views, and published his well-known *Checks to Antinomianism*. After three years spent in Switzerland in pursuit of health, he returned to England and devoted himself to his work until his death. He was one of the founders of Methodism, and a man of great industry and piety. His writings are published in four volumes.

FLEURUS, a small town of Belgium in the province of Hainaut, situated north of the left bank of the Sambre, and 15 miles west of Namur. It has been the scene of several contests. Population, 2,300.

FLEURY, FLOWRY, FLEURETTE, ETC., in heraldry, signifies that the object is adorned with fleurs-de-lis. A cross-fleury, for example, is a cross whose ends are in the form of fleurs-de-lis.

FLEURY, EMILE FELIX, a French general, born in Paris, Dec. 23, 1815, died Dec. 12, 1884. He was educated at the Collège Rollin, entered the army in 1837, served in eleven campaigns in Algeria, and by his gallantry obtained rapid promotion. Returning to France in 1848, he served the Bonapartist cause, became an officer of the Legion of Honor in 1849 and grand officer in 1859, and was summoned to the French Senate in 1865. In 1866 he was sent on a diplomatic mission to Italy, and in 1869 became ambassador at St. Petersburg. On the downfall of Napoleon III in 1870, he retired to Switzerland. He was placed on the retired list of the army in 1879.

FLEXURE, or FLEXION, the bending or curving of a line or figure. A curve is said to have a point of *contrary* flexure at the point where it changes its character of concavity or convexity towards a given line.

FLINDERSIA, a genus of trees of the natural order *Cedrelaceæ*, an Australian species. Yields timber which is little inferior to mahogany.

FLINT, a city of Michigan, and county-seat of Genesee county, 60 miles northwest of Detroit. It

has a State institution for the deaf, dumb and blind, and steam saw mills where 50,000,000 feet of lumber are sawed annually. Pop., 9,803.

FLINT, AUSTIN (1812-86), an American physician. His professional career began in 1833; he practiced in Boston, Mass., and then in Buffalo, N. Y. In 1844-45 he was a professor at the Rush Medical College in Chicago, Ill., and from 1847, for six years, in the Buffalo Medical College. From 1852 to 1856 he was a professor in the Louisville University; in 1856 in the Buffalo Medical College; in 1858 in the New Orleans School of Medicine; in 1861 in the Long Island College Hospital, and from 1863 until his death was professor of the principles and practice of medicine in the Bellevue Hospital Medical College. He was consulting physician to various hospitals, and from 1872 to 1885 was president of the New York Academy of Medicine. He was a member of many medical and scientific bodies both in America and Europe, and was present at several important medical congresses as a delegate. His contributions to medical literature were numerous.

FLINT, AUSTIN, an American physician, son of the preceding, born in 1836. He began to practice medicine in Buffalo in 1857, and in the following year became an attending surgeon in the Buffalo city hospital, and a professor in the Medical College. In 1859 he was chosen professor of physiology in the New York Medical College, and in 1860 to a similar chair in the New Orleans School of Medicine. In 1861 he became professor of physiology and microscopic anatomy in the Bellevue Hospital Medical College, and for eight years lectured in the Long Island College Hospital. In 1874 he became surgeon-general of New York State. He has written several works on physiological topics.

FLINT RIVER, in Michigan, rises in Lapeer county, flows west and northwest and unites with the Shiawassee to form the Saginaw River. It is about 100 miles in length.

FLINT RIVER rises in Clayton county, Ga., and flows by an irregular course to the southwest corner of the State, where it unites with the Chattahoochee to form the Appalachian River. It is about 300 miles in length, and is navigable by light-draught steamers as far as Albany, nearly 150 miles from its mouth.

FLOATING-BATTERY, a hulk heavily armed and made as invulnerable as possible, formerly used in defending harbors, or in attacks on marine fortresses. Floating batteries are interesting as a stage in the development of the modern iron-clad.

FLOATING-ISLANDS, the formations caused either by the aggregation of driftwood in the creeks and bays of tropical rivers and the deposition thereon of soil and vegetable matter, or by the detachment of portions of a river-bank or lake-shore, on which the interlacing roots of plants constitute a foundation sufficiently strong to support soil whereon herbage, and occasionally even trees, are able to grow. Floating islands are sometimes seen 50 or 100 miles distant from the mouth of the large rivers of America, Asia, and Africa.

FLOATING WAREHOUSES, places of storage constructed, chiefly in French ports, for the reception of gunpowder, nitro-glycerine, petroleum, and other dangerous wares, and anchored where they are not liable to be fired and in case of explosion can do little damage to other property. Each warehouse consists essentially of 100 hollow iron cylinders, arranged in four rows of twenty-five each, firmly lashed or strapped together to form a kind of raft. Each cylinder, sixteen feet long by six or seven in diameter, has a man-hole at one end by

means of which it is filled. They are placed upright when in position.

FLOATSTONE, a variety of quartz, consisting of fibers—delicate crystals—aggregated so that the whole mass is sponge-like, and so light, owing to the air confined in the interstices, that it floats for a while on water. It is found in a limestone of the chalk formation near Paris, in imbedded masses, or incrusting flint nodules.

FLOBECQ, a small town of Belgium, in the province of Hainault, 20 miles northeast of Tournai. It has extensive manufactories of linens, has breweries, salt works, oil and flour mills. Population, 6,250.

FLOGGING, a mode of corporal punishment, which, in deference to public opinion, was abolished in 1881, and which had existed from time immemorial in the British army and navy. It was often inflicted upon slight occasion, and with barbarous severity.

FLOQUET, CHARLES, a French statesman, born in the Lower Pyrenees in 1828, and called to the Paris bar in 1851. After the fall of the empire he was deputy mayor and member of the National assembly, but having resigned during the commune, he was suspected of disloyalty and interned at Pau until 1872. He subsequently held various offices; was twice vice-president of the Chamber, and was president of the Brisson cabinet. He formed a ministry on the resignation of the Tirard cabinet, and was president of the council and minister of the interior. He wounded General Boulanger in a duel fought in 1888. Having introduced a bill for the revision of the French Senate, the ensuing debate resulted in the defeat of his ministry, and he resigned in 1889. Later he became finance minister, but in 1892 resigned under charges.

FLOREAL (the "flowery"), the eighth month of the year in the calendar of the first French Republic, which, from Nov. 24, 1793, to Sept. 9, 1805, was used in place of the Gregorian. It commenced April 20th and ended May 20th.

FLORENCE, the county-seat of Lauderdale county, Ala., situated at the head of navigation on the Tennessee River. Here is a State normal school, female college, and in the vicinity several cotton factories. Pop. (1890), 6,012.

FLORENCE, a city of Marion county, Kan., situated at the confluence of the Cottonwood River and Doyle Creek. Pop., 1,229.

FLORENCE, a village of Hampshire county, Mass., 3 miles northwest of Northampton. It has establishments where sewing-machines, silk, cotton and woolen goods are manufactured. Pop., 2,789.

FLORENCE, a railroad junction of Darlington county, S. C. It has railroad shops, machine shops, and a population of 3,395.

FLORENCE, the county-seat of Florence county, Wis., located in the vicinity of iron-ore mines. The lumber trade and iron business are the sources of prosperity in the town. Pop., 500.

FLORENTINE WORK, or **PIETRA DURA**, a kind of ornamental work composed of black or white marble inlaid with hard stones, such as agates and jaspers. Although Florence is the most famous seat of this art, the Russians produce finer work than the Italians.

FLORET, a term applied to the flowers of any small and closely crowded inflorescence which resembles at first sight a single flower.

FLORICULTURE. While floriculture has been carried on as a business in the United States for more than one hundred years, its extent was not of large proportions until during the last score of years. It was not made a subject of official census investigation until 1890. According to the Government report, bearing date at the Census Office

April 21, 1891, the recent growth of the business has been very remarkable.

Floral establishments were found in every State except Idaho, Nevada, Indian Territory, and Oklahoma. In the United States there were 4,659 floral establishments, 312 of which were owned and conducted by women. Of the total number of establishments 2,795 were started between 1870 and 1890, and of these 1,797 between 1880 and 1890. These 4,659 establishments had in use in the census year 38,823,247 square feet of glass, covering a space of more than 891 acres of ground. The establishments, including fixtures and heating apparatus, were valued at \$38,355,722.43; tools and implements, \$1,587,693.93, and gave employment to 16,847 men and 1,958 women, who earned in the year \$8,483,657. Fuel for heating cost \$1,160,152.66. The products for the year were 49,056,253 rose bushes, 38,380,872 hardy plants and shrubs, while all other plants amounted to 152,835,292, reaching a total value of \$12,036,477.76 for plants. Cut flowers brought an additional income of \$14,175,323.01.

From the census report it appears that the largest number of square feet of glass in one establishment in the United States is in the District of Columbia; the oldest establishment was started in New York; the largest number of roses propagated were, respectively, in Pennsylvania, Illinois, and Ohio; the largest number of hardy plants propagated were, respectively, in Illinois, New York, and Kansas; the largest total value of plant sales were, respectively, in New York, Pennsylvania, and California, and the largest total value of cut-flower sales were, respectively, in New York, Illinois and Pennsylvania.

In addition to the Society of American Florists, 965 State and local floral societies and clubs and 358 horticultural societies, aided by the agricultural and horticultural press helped to develop this industry to its present large proportions.

The table on page 693 shows, by States, the number of florists' establishments, number owned by women, largest and smallest green house in each State, total square feet of glass, area of land cultivated, value of tools and implements, and total value of establishments. New Jersey, situated as it is between the New York and Philadelphia city markets, makes the largest showing of any State in the Union in proportion to its size.

The statistics given were obtained direct from the florists themselves in answer to questions sent them on special schedules, by personal visitation, and by the combined efforts of some of the florists' clubs. The California State Floral Society went so far as to aid in the good work by appointing a special committee and making a careful canvass of the whole State, and the Census Office investigations fully corroborate the thoroughness of their work.

FLORIDA, STATE OF (see *Britannica*, Vol. IX, pp. 338-41). Florida extends the farthest south of all the Southern States, and has more sea-coast (over 1,200 miles) than any other State in the Union. The larger part of the State is a peninsula 350 miles long, and about 100 miles wide, forming one of the principal outlying barriers of the Gulf of Mexico. Near the coast the surface rises only from 10 to 100 feet, but the interior is higher, and somewhat more undulating. Owing to its proximity to the tropics, and the presence of the sea on all sides, extremes of temperature are unknown, and the State has long been the favorite winter resort of Northern pleasure seekers and invalids. The hot, moist climate admirably adapts it to agriculture, stock-raising and fruit-growing. The Everglades, a vast, marshy lagoon in the southern part of the State, comprise an area of about 4,000 square

Divisions and States.	Total Estab-lish-ments.	Owmed and managed by women.	Largest num-ber of sq. feet in one estab-lishment un-der glass.	Smallest number in one estab-lishment under glass.	Total square feet of glass in State.	Area of land cultivated (acres).	Value of tools and imple-ments used.	Total value of estab-lishments.

miles, two-thirds of which are regarded as irclaimable, uninhabitable and almost impenetrable. By an extensive drainage system projected by the Atlantic and Gulf Coast Canal and Okeechobee Land Company, a considerable section bordering the extreme northern Everglades, comprising the Lake Okeechobee region, is becoming subjected to the uses of agriculture. Lake Okeechobee, covering an area of 1,000 square miles, was found to have an elevation of about 20 feet above high tide, and by cutting a canal to connect the lake with the Caloosahatchee River its level has been materially lowered, thus reclaiming hundreds of thousands of acres of choice land.

Cotton, rice and sugar-cane are grown considerably, but the most characteristic industry is the cultivation of oranges, lemons and other tropical fruits. Along the St. John's River and throughout the lake region of Central Florida, orange-groves abound on every hand. The principal manufactures are lumber (pine), ship timber, naval stores, leather (made from alligator skins), salt, cotton-seed oil and cigars. The collection and preparation of sponges, large deposits of which occur in the waters of the coast, also furnish occupation to a considerable portion of the population.

In 1886 Florida adopted a new constitution, which went into effect Jan. 1, 1887. Under it the executive department consists of a governor, attorney-general, comptroller, treasurer, superintendent of public instruction and commissioner of agriculture, each of whose term of office is four years. The governor is ineligible to reelection for the next succeeding term. The governor has the appointment of an adjutant-general, with the rank of major-general, who is chief of the governor's staff. The legislative department consists of a senate and house of representatives, the former having 68, and the latter 32 members. Senators are elected for four years, and representatives for two years. The legislature meets biennially, and each session is limited to 60 days. The judicial department consists of a supreme court, with three supreme judges, each holding office six years, and elected by the people, one every two years; circuit courts, with seven circuit judges, one for each judicial circuit, appointed by the governor and confirmed by the senate, the term of office being six years; county courts, one county judge being elected in each county, and holding office four years; and justices' courts, two or more justices of the peace being elected in each county for a term of four years.

GOVERNORS OF FLORIDA.

Andrew Jackson.....	1821-22	John Milton.....	1861-65
William P. Duval.....	1822-24	William Marvin.....	1865-66
John H. Eaton.....	1834-36	David S. Walker.....	1866-68
Richard K. Call.....	1836-39	Harrison Reed.....	1868-72
Robert R. Reid.....	1839-41	O. B. Hart.....	1872-74
Richard K. Call.....	1841-44	M. L. Stearns.....	1874-77
John Branch.....	1844-45	George F. Drew.....	1877-81
W. D. Moseley.....	1845-49	Wm. D. Bloxham.....	1881-85
Thomas Brown.....	1849-53	E. A. Perry.....	1885-89
James E. Broome.....	1853-57	Francis P. Fleming.....	1889-93
Madison S. Perry.....	1857-61	Henry L. Mitchell.....	1893—

The governor, secretary of State, attorney-general, State treasurer and superintendent of public instruction, comprise the State board of education. The public schools are well sustained, and the cities and larger towns contain numerous excellent graded and high schools. There is a State Agricultural College at Lake City; DeLand College at DeLand; East Florida Seminary at Gainesville; West Florida Seminary at Tallahassee; Rollins College at Winter Park; State Normal College for

whites at DeFuniak Springs; a State Normal College for colored teachers at Tallahassee; State Insane Asylum at Chattahoochee; and a State Academy for the Blind, Deaf and Dumb, at St. Augustine.

The area of the State is 58,680 square miles and the population in 1880, 269,493; in 1890, 391,422. The following table gives the population by counties in 1880 and 1890:

Counties.	1890.	1880.
Alachua.....	22,934	16,462
Baker.....	3,533	2,303
Bradford.....	7,516	6,112
Brevard.....	3,401	1,478
Calhoun.....	1,681	1,580
Citrus.....	2,394	
Clay.....	5,154	2,838
Columbia.....	12,577	9,589
Dade.....	861	257

Taylor.....	2,123	3,279
Volusia.....	8,467	3,204
Wakulla.....	3,117	2,723
Walton.....	4,816	4,201
Washington.....	6,426	4,089

The principal agricultural crops are Indian corn, oats, potatoes and cotton. In 1888 there were devoted to the cultivation of Indian corn 463,392 acres, producing 4,541,000 bushels, valued at \$2,951,650; oats, 53,021 acres, producing 599,000 bushels, valued at \$365,390; potatoes, 2,306 acres, producing 155,000 bushels, valued at \$142,142; cotton, 259,990 acres, producing 30,158,840 pounds, valued at \$2,533,343.

January 1, 1890, there were in Florida 34,737 horses, 13,000 mules, 54,951 milch cows, 565,201 oxen and other cattle, 110,351 sheep, 358,021 hogs.

FLORIDIA, a town of Sicily, in the province of Noto, 7 miles W. N. W. from Syracuse. It stands in a wide plain, surrounded by vineyards, olive-groves, and corn-fields. Population, 8,492.

FLORIN (It., *florino*), a silver coin so called either in allusion to Florence, where it was first struck, in the 12th century, or because it was stamped with a lily. The florin was issued in gold at Florence in 1252. The name was subsequently given to different coins in different countries. England struck a gold florin in 1343, and the silver coin, worth two shillings, or about 48 cents, current since 1849, bears the official name of florin; the florin of the Netherlands is worth about 40 cents, and that of Austria about 36 cents.

FLORINIANS, a Gnostic sect of the second century, so called from a Roman priest, Florinus, a pupil of Polycarp.

FLOTANT, used in heraldry to express that the object is flying in the air, as a banner-flotant.

FLOTOW, FRIEDRICH VON, BARON, a German composer, born at Teutendorf in Mecklenburg, April 27, 1812, died at Wiesbaden, Jan. 24, 1883. At the age of sixteen he went to Paris and began to study under Reicha. His reputation was made by his earliest operas, *Le Naufrage de la Méduse* (1839); *Stradella* (1844); and *Martha* (1847). In 1856 he was appointed intendant of the theater at Schwerin. In 1863 he resigned this position and returned to Paris. Of Flotow's later operas three attained marked success—*Indra* (1853); *La Veuve Grapin* (1859); and *L'Ombre* (1869).

FLOUR, MANUFACTURE OF. See Britannica, Vol. IX, p. 343-47.

FLOUR, St., a small town of France in the department of Cantal, finely situated on a steep basaltic plateau at an elevation of 3,000 feet, 84 miles northeast of Aurillac. It is entirely built of lava and basalt. It has manufactures of hollow ironware, cloth, and table linen. Population, 6,046.

FLOWER, ROSWELL P., was born in Jefferson county, New York, in 1835. He was left fatherless in early boyhood and at the age of 14 became clerk in a country store. He also worked in a brickyard, but managed to get a high-school education and became a postoffice clerk, and then went into the jewelry business for ten years. He next became a successful New York broker, and in 1882 was elected to Congress, defeating W. W. Astor. In 1889 Mr. Flower was again sent to Congress, and in 1891 was elected governor of his native State.

FLOWER, WILLIAM HENRY, an English zoologist, born at Stratford-on-Avon in 1831, served as assistant surgeon in the Crimea, and afterwards became demonstrator of anatomy at the Middlesex hospital. In 1861 he was appointed conservator of the Hunterian Museum, in 1869 Hunterian professor of comparative anatomy and physiology, and in 1884 director of the natural history department of the British Museum. In 1889 he presided over the meeting of the British Association at Newcastle. He is a fellow of the Royal Society, LL.D. of Edinburgh and Dublin, and has written numerous scientific papers and several volumes, chiefly on mammals.

FLOX ERIS, a term applied to the suboxide or red oxide of copper.

FLOYD, JOHN BUCHANAN (1807-63), an American statesman. He was in the Virginia legislature in 1847-49 and 1853, and was governor in 1850-53. He was Secretary of War from 1857 to 1860. In 1861 he was appointed brigadier-general in the Confederate army.

FLOYD, WILLIAM (1734-1821), a Signer of the Declaration of Independence. In 1774 he was a delegate to the Philadelphia Congress, and in 1775 was chosen a delegate to the first Continental Congress. He was a member of every Continental Congress up to 1782, and at the same time, from 1777 to 1783, was State Senator. He held the same office from 1784 to 1788. In 1792, 1800, and in 1804 he was a Presidential elector, and in 1801 he sat for Suffolk county in the convention of that year.

FLUKE, the pointed triangular termination to each arm of an anchor.

FLUME, THE, a cleft in two walls of rock in the Franconian Mountains of the White Mountain region. A small stream flows through this cleft and falls in a cascade 600 feet. This is one of the finest summer resorts of New Hampshire, and is located in Grafton county.

FLUSH-DECK, Decks of vessels are said to be flush when extending without break on one level from the bow to the stern.

FLUSHING, a city of New York, on the north shore of Long Island (see Britannica, Vol. IX, p. 350). The city is largely populated by New York business men, and has all city improvements, such as good schools, churches, street railways, gas and electric lights, free postal delivery, banks, building and loan associations, excellent water works, police force, fire department, and a handsome public park. Population in 1880, 6,682; in 1890, 19,136.

FLUSTRA, a genus of zoöphytes, of the family *Flustridæ*. The name is derived from the Saxon *flustrian*, to weave, because of the mat-like structure of the polypidoms, which in this genus are extremely plant-like, and are often regarded as belonging to the vegetable and not to the animal kingdom. In some species the polypidom assumes the appearance of a branching frond, with polype cells on either side. The polypes have the power of moving either the whole head at once or the tentacles separately, and show no little activity, so that a living flustra seen through a magnifying glass is a most beautiful and interesting object. A single square inch has been found to contain 1,800 cells.

FLUTE-WORK, a name applied to a particular class of stops in organ building, in contradistinction to *reed-work*. There are also numerous stops in organs specially designated with the names of flutes of different kinds, of eight feet and four feet pitch.

FLY-POWDER, the name applied to any powder used to kill flies. It is generally a compound of metallic arsenic and arsenious acid, obtained by the partial oxidation of the metal on exposure to air.

FLYING DRAGON, or **FLYING LIZARD**, a genus of saurian reptiles, allied to iguanas, but remarkably distinguished from them and from all other reptiles now existing, by lateral membranes which support them in a parachute-like manner in the air, and enable them to pass from tree to tree. These membranes are supported on the first six false ribs, which instead of encircling the abdomen stand out at right angles from the body for this purpose, and when not in use they are folded close to the body. There is an inflatable pouch under the chin, sustained partly by the hyoid bone and partly by two small bones. The tongue is extensible, the scales are small and imbricated, and the tail is very long. All the species are of small size and are native of the East Indies. They live among the branches of trees and feed on insects.

FLYING-PHALANGER. See Britannica, Vol. XVIII, pp. 727-29.

FLYING SQUID, a genus of cephalopodous mollusks allied to the Calamaries, but differing from them in having the eyes exposed and not covered with skin. The tail is large, and the power of locomotion great; they not only pass rapidly through the water, but leap out of it high enough sometimes to fall on decks of ships.

FLYING SQUIRREL, a species of the squirrel family (*Sciuridæ*), which have a fold of skin like a parachute along the sides of the body, by which means they are enabled to take extraordinary leaps, gliding for a great distance through the air. Their habits correspond with those of the real squirrel. The North American species, abundant from the Gulf of Mexico to Canada, is six or seven inches long, without the tail; has large black eyes, extremely soft fur, and is very rapid in motion. They are also found in the North of Europe, Asia, and the Indian Archipelago.

FOCUS: in optics, a point in which several rays meet and are collected after being reflected or refracted, while a *virtual focus* is a point from which rays tend after reflection and refraction. The principal focus is the focus of parallel rays after reflection or refraction.

FO, or Foh, the Chinese name for Buddha, the founder of Buddhism, which was introduced into China about A. D. 67.

FOG, or Mist, the visible watery vapor sometimes hanging near the surface of the earth, and caused, as clouds are, by the precipitation of the moisture of the atmosphere. This takes place when a stratum of atmosphere comes in contact with a colder stratum or with a portion of the earth's surface, as a hill by which it is cooled, so that it can no longer hold in solution as much moisture as before. It takes place also when a cold stratum of atmosphere comes above a moist, warm portion of the earth's surface, the exhalations from which are precipitated and become visible as they ascend into it.

FOLGER, CHARLES JAMES, born in Nantucket, Mass., 1818; died 1884. He was admitted to the bar in 1839, and held various judicial offices in New York State. In 1856 he joined the Republican party, and from 1861 to 1869 sat in the State Senate. In 1869-70 he was assistant treasurer of the United States in New York; in 1871 was elected to the State Court of Appeals, served as chief justice in 1880, and was reelected as associate for a full term the same year. In October, 1881, President Arthur made him secretary of the treasury, which office he held until his death. In September, 1882, he received the Republican nomination for governor of New York, but the "mugwumps" voted with the Democrats, and Grover Cleveland defeated Judge Folger by a majority of more than 190,000.

FOLIA MALABATHRI, the dried leaves of *Cinnamomum nitidum*, and partly of *Cinnamomum Tamala*, species of cinnamon, small Indian trees or shrubs. It was formerly much in repute as a medicine, and used as an aromatic tonic.

FOLIATION, a term applied to the alternating layers or plates of different mineralogical nature, of which gneiss and some other metamorphic schists are composed.

FOLKNOTE, the term applied by the Saxons to district meetings generally, or to the general meeting which was afterwards converted into the Witenagemôte, or meeting of the councilors or representatives of the nation.

FOLLY ISLAND, in Charleston county, S. C., is bounded on the southeast by the Atlantic, and on the landward side by Folly Island River, and extends from Lighthouse Inlet on the northeast to Stono River on the southwest. It is in part heavily timbered.

FOMENTATION, an application of warmth and moisture to a part, by means of cloths wrung out in hot water, sometimes medicated with vegetable infusions of substances calculated to relieve pain or stimulate the surface.

FOMITES (Lat. plu. of *fomes*, "fuel"), a term employed in medicine to denote porous substances, such as bedding, furniture, clothing, etc., capable of retaining infection, and by means of which disease may be propagated.

FONDA, the county-seat of Montgomery county, N. Y., situated on the Mohawk River. Pop., 1,190.

FOND DU LAC, a city of Wisconsin, county-seat of Fond du Lac county (see Britannica, Vol. IX, p. 361). Although the population of the city has decreased somewhat during the last decade, it is an important business center, situated in the midst of a fine farming region. It has good water communications, excellent railroad connections, and large manufactories of lumber, sashes, doors and blinds, and agricultural implements. Its principal public buildings are a court-house, opera-house, and high school. It is noted for the number and excellence of its artesian wells, has extensive water-works, and is lighted by gas and electricity. Population in 1880, 13,094; in 1890, 11,942.

FONSECA, MARSHAL MANUEL DA, Brazilian soldier and statesman, was born about 1834. He was educated in Rio Janeiro, and on graduation entered the army. In the war between Brazil and Paraguay, in 1865, he distinguished himself and rose to the rank of major. At the close of the war he was given a command in the province of Matto-Grasso. Subsequently he was made a general and placed in charge of the cartridge factory and magazine at Rio Janeiro, where he organized a military club, in which he became very popular. The influence he gained here over his brother officers was used by him, it is said, to foment discontent in the army, and for the spread of Republican ideas, with which he had become imbued, and the imperial authorities, therefore, transferred him to Matto-Grasso, of which he subsequently became governor. His removal from the Brazilian capital did not, however, stifle the military discontent, which culminated in November, 1889, in an uprising of the army, the expulsion of Emperor Pedro and family, and the proclamation of a republic, of which General Fonseca was made the first president. He proved to be a self-seeking and oppressive ruler, and was in turn the victim of a revolution, March, 1892, which placed Vice-President Peixotts in the presidential chair. The same year saw Fonseca's death.

FONTANELLE, a post-hamlet of Washington county, Neb., on the Elkhorn River, 10 miles northeast of Fremont. It is the seat of a Congregational college.

FOOD. Food is whatever feeds the body, and hence includes air and water, but as generally understood the term is used as referring to such food as requires digestion in the body. Food ought to embrace all the elements found in the body. These, as given by chemists, number 15. According to Prof. Atwater's table the following are the chemical constituents of the body of a man weighing 148 pounds.

5 GASES.....	Oxygen.....	92.4 pounds.
	Hydrogen.....	14.6 "
	Nitrogen.....	4.6 "
	Chlorine.....	0.12 "
	Fluorine.....	0.02 "

3 METALLOIDS..	Carbon.....	33.30 pounds.
	Phosphorus.....	1.40 "
	Sulphur.....	0.24 "
7 METALS.....	Calcium.....	2.80 "
	Potassium.....	0.34 "
	Sodium.....	0.12 "
	Magnesium.....	0.04 "
	Iron.....	0.02 "
	Manganese.....	Traces.
	Copper.....	Traces.

While the body is composed of the 15 elements named above, and in the proportions there stated, it would be impossible to nourish it with them in their elementary condition.

The amount of food required daily Huxley estimated thus: Lean beef-steak, 5,000 grains; milk, 7,000 grains; bread, 6,000 grains; potatoes, 3,000 grains; butter, 600 grains; water, about 6 pounds—taken as both food and drink, to supply the daily loss to the system. The water required for the system comes largely from the food, as is shown by Prof. Atwater in the following tables:

COMPOSITION OF ANIMAL FOODS.

Flesh, etc., Freed from Bone, Shell, and Other Refuse.

KINDS OF FOOD MATERIALS. (Italics indicate European analysis; the rest are American.)	Nutrients.

*Of analysis of American flours. †From flour of about average composition.

A French statistician asserts that a man living for fifty years eats during that time 79,000 pounds of bread, 16,000 of meat, 4,000 of vegetables, eggs and fish, and requires 7,000,000 gallons of water; for fifty-nine per cent. of the entire body is composed of water, which must, therefore, be introduced into the system in about that proportion in our foods, to keep the organism in proper working order, not only keeping the tissues moist and succulent, but by washing out effete matters as well.

Water, as the most important of the inorganic foods, also deserves our careful attention, not only because it composes the bulk of our bodies, but also because it is the agent by which many of their illa are induced. Long ago the human body was defined as forty-five pounds of solid matter, diffused through five and a half pails of water. This is not absolutely exact, but the annexed table shows that water is found in all of the tissues, though in widely varying proportions:

PARTS IN A THOUSAND OF WATER AND SOLIDS. (BESANEZ.)

Parts.	Water.	Solids.
Enamel of the teeth.....	2	998
Teeth.....	100	900
Bones.....	220	780

It is known that a man loses on the average about two quarts of water per day. About a quarter of this amount passes by the lungs, and the remainder by the skin and kidneys.

DIGESTING FOOD.—The first stage in the process of digestion is that of mastication, in which solid foods are ground fine and mixed thoroughly with the fluids of the mouth. These fluids are supplied by the mucous and salivary glands. Together

they secrete about a quart of liquid, which is continually being poured through the ducts leading from these glands. The ducts of the sublingual and submaxillary glands, near together, open into the mouth just beneath the tongue, while the ducts of the parotids pour their saliva into the mouth through openings nearly opposite the second of the molars of the upper jaw. With the tip of the tongue the saliva can be continually felt trickling out of these apertures, and greatly increased in quantity while dining, or when the mouth "waters" for something good to eat.

The purpose of the saliva is two-fold: first, to lubricate the food so thoroughly that swallowing may be easy; and, second, to effect in the starch of the food a chemical change which transforms it into a variety of sugar (glucose) that can be utilized in the body. If for any reason this is not accomplished, either because the food is not finely enough ground by the teeth or because the saliva is deficient in quantity or quality, starchy indigestion results, and hence for many dyspeptics bread is the most difficult thing to digest. Young infants have little or no saliva, and hence are unable properly to digest starchy food. Although small quantities may be disposed of lower down in the alimentary canal, the bulk of these starchy foods remains undigested, and causes innumerable infantile colics and not a few deaths. The majority of patent infant foods are starchy in their nature, and hence evil in their effects. Milk, properly prepared, is the best food for babies for the reason that it contains all the necessary elements of food, namely: inorganic salts, albuminoids (casein or curd), and hydrocarbons in the cream and sugar of the milk.

Let us, then, briefly consider in detail the digestion of a mouthful of milk, since it contains all the ingredients necessary for the nourishment of the body, and all the essential varieties of food that can be found on any table. Undigested milk is poison, but properly digested it forms bone, muscle, sinew, by the aid of germinal matter. Each kind of germinal matter needs its appropriate nourishment, all of which can be gathered from the curd, cream, and salts of milk.

First, as to the curd, which corresponds to the nitrogenous foods of the adult. With the latter the nitrogenous food requires to be reduced to small fragments by the teeth before it descends the esophagus. Liquids escape this process, and immediately find their way down into the stomach, whose acid juices immediately clot it. If these clots are too large, or firm, they cause distress; but if the milk is properly acted on it forms soft, fine curds, which are more digestible than the original milk, for they contain their nitrogenous matter in a form readily to be acted upon by the gastric juice, which is an acid fluid constantly secreted by glands located in the membrane lining the inside of the stomach. The duty of these glands, known as the "peptic glands," is to prepare the gastric juice, or fluid, which is a colorless, watery, acid liquid containing from three to four parts in a thousand of pepsin, an animal ferment, which has the remarkable property of transforming albuminoids into peptones. A solution of peptone looks very like a solution of albumen, from which it differs mainly in the fact that albumen is unable to pass through the animal membranes, while peptone readily does so. The peptonized albuminoids pass directly through the coats of the stomach into the lacteals there located.

But all our food is not albuminoid, and hence is not digested in the stomach. Portions which are not peptonized, and which, therefore, cannot enter into the lacteals, pass in the circulation as chyme

through the pylorus into the smaller intestines, where the digestion is completed. In the intestines the chyme is mixed with bile and other ferments. The following table, showing not only their names, but their uses, is taken from Roberts:

NAME.	FUNCTION.
1. <i>Phyalin</i> , or salivary diastase, contained in the saliva.	1. Changes starch into dextrine and glucose.
2. <i>Pepsin</i> , contained in gastric juice.	2. In acid fluids changes albuminoids into peptones.
3. <i>Curdling ferment</i> , contained in gastric juice.	3. Coagulates casein.
4. <i>Trypsin</i> , contained in pancreatic juice.	4. In alkaline solutions transforms proteids into peptones.
5. <i>Curdling ferment</i> , found in pancreatic juice.	5. Coagulates milk casein.
6. <i>Pancreatic diastase</i> , found in pancreatic juice.	6. Changes starch into dextrine and glucose.
7. <i>Emulsive ferment</i> , found in pancreatic juice.	7. Emulsifies fats.
8. <i>Bile</i> , poured into duodenum.	8. Assists in emulsifying fats.
9. <i>Invertin</i> , found in intestinal juice.	9. Converts cane sugar into inverted sugar.
10. <i>Curdling ferment</i> , found in intestinal juice.	10. Coagulates casein.

TIME REQUIRED FOR DIGESTING FOOD.—The following figures have been tabulated as the result of repeated and careful experiments:

Food.	How Cooked.	H. M.
Apples, sour, mellow.....	Raw.....	2.00
Apples, sour, hard.....	Raw.....	2.50
Apples, sweet, mellow.....	Raw.....	1.50
Bass, striped.....	Boiled.....	3.00
Beans, pod.....	Boiled.....	3.50

COOKING MEATS.—For all ordinary food, all the nutritious constituents should be retained either in the meat itself or in its liquid surrounding. The albumen, gelatine, and fibrine of the meat must be retained in a state of semi-solidity. To do this both cold and boiling water should be avoided. Cold water takes out the albumen. This will be shown by immersing minced meat (the mincing increasing the amount of surface to the water) in cold water for a few hours; on removing and straining such minced meat it will be found to have lost its color, and if it be now cooked it is insipid, and even nauseous if eaten in any quantity; if given to dogs, cats, and pigs, they will soon turn from it, and if limited to this juiceless food, will speedily languish and die. "Although the meats from which the juices have been extracted are nearly worthless *alone*, and those from which the juices are nearly extracted are nearly worthless *alone*, either of them becomes valuable when eaten with the juices."*

Boiling water hardens the albumen of meat to a leathery appearance. This may be shown experimentally by subjecting an ordinary beefsteak to the action of boiling water for about half an hour. It will come out in what Williams calls "the abominable condition too often obtained by English cooks." The water, instead of boiling (212°) should beat the temperature at which albumen just begins to coagulate; that is, about 134°, or between that and 160° as the extreme. This is not the condition of "simmering," for that is about the same as boiling; namely, 212°. It is said that the French cook escapes the "simmering delusion" by her use of the *bain marie*, or "water bath," as the chemist calls it in the laboratory. It is simply a vessel immersed in an outer vessel of water; the water in the outer vessel may "simmer" or boil, while that in the inner vessel cannot because of the less heat. Some persons use a "milk-scald" for the purpose.

One of the incidental advantages of the *bain marie* is that the stewing may be performed in earthenware or even glass vessels, seeing that they are not directly exposed to the fire. Other forms of such double vessels are obtainable at the best house-furnishing stores. A very neat apparatus of this kind is "Dolby's Extractor," which consists of an earth-

enware vessel that rests on a ledge, and thus hangs in an outer tin-plate vessel; but, instead of water, there is an air-space surrounding the earthenware pot. A top screws over this, and the whole stands in an ordinary saucepan of water. The heat is thus very slowly and steadily communicated through an air-bath, and it makes excellent beef-tea; but, being closed, the evaporation does not keep down the temperature sufficiently to fulfill the above-named conditions for perfect stewing. At temperatures *below the boiling-point* evaporation proceeds superficially, and the rate of evaporation at a given temperature is proportionate to the surface exposed, irrespective of the total quantity of water; therefore, the shallower the inner vessel of the *bain marie*, and the greater its upper outspread, the lower will be the temperature of its liquid contents when its sides and bottom are heated by boiling water. The water in a basin-shaped inner vessel will have a lower temperature than that in a vessel of similar depth, with upright sides, and exposing an equal water surface. A good water-bath for stewing may be extemporized by using a common pudding-basin (one with projecting rim, as used for tying down the pudding-cloth), and selecting a saucepan just big enough for this to drop into, and rest upon its rim. Put the meat, etc., to be stewed into the basin, pour hot water over them, and hot water into the saucepan, so that the basin shall be in a water-bath; then let this outer water simmer very gently, so as not to jump the basin with its steam. Stew thus for about double the time usually prescribed in cookery-books, and compare the result with similar materials stewed in boiling or "simmering" water.

We quote again from Williams: "I may, however, mention an experiment that I have made lately. I killed a superannuated hen—more than six years old, but otherwise in very good condition. Cooked in the ordinary way she would have been uneatably tough. I cannot guarantee the maintenance of the theoretical temperature, having suspicion of some simmering. After this she was left in the water until it cooled, and on the following day was roasted in the usual manner; that is, in a roasting oven. The result was excellent; as tender as a full-grown chicken roasted in the ordinary way, and of quite equal flavor, in spite of the very good broth obtained by the preliminary stewing. This surprised me. I anticipated the softening of the tendons and ligaments, but supposed that the extraction of the juices would have spoiled the flavor. It must have diluted it, and that so much remained was probably due to the fact that an old fowl is more fully flavored than a young chicken. The usual farm-house method of cooking old hens is to stew them simply; the rule in the midlands being one hour in the pot for every year of age. The feature of the above experiment was the supplementary roasting. As the laying season comes to an end, old hens will be a drug in the market, and those among my readers who have not a hen roost of their own will oblige their poultryers by ordering a hen that is warranted to be four years old or upward. If he deals fairly he will supply a specimen upon which they may repeat my experiment very cheaply. It offers the double economy of utilizing a nearly waste product and obtaining chicken-broth and roast fowl simultaneously."

"One of the great advantages of stewing is that it affords a means of obtaining a savory and very wholesome dish at a minimum of cost. A small piece of meat may be stewed with a large quantity of vegetables, the juice of the meat savoring the whole. Besides this it costs far less fuel than roasting."

*W. Mattien Williams, a well-known chemical authority. In the preparation of this article the editor has drawn freely from the facts presented by Prof. Williams in an admirable series of articles furnished for "Knowledge," England, and subsequently reproduced in America.

"The wife of the French or Swiss landed proprietor, that is, the peasant, cooks the family dinner with less than a tenth of the expenditure of fuel used in England for the preparation of an inferior meal. A little charcoal under her *bain marie* does it all. The economy of time corresponds to the economy of fuel; for, the mixture of viands required for the stew once put into the pot, it is left to itself until dinner-time, or at most an occasional stirring of fresh charcoal into the embers is all that is demanded."

RELATIVE VALUE OF VEGETABLE AND ANIMAL FOOD.—Williams, in his article in "Knowledge," well says: "At the outset it is necessary to brush aside certain false issues that are commonly raised in discussing this subject. The question is not whether we are herbivorous or carnivorous animals. It is perfectly certain that we are neither. The carnivora feed on flesh alone, and eat that flesh raw. Nobody proposes that we should do this. The herbivora eat raw grass. Nobody suggests that we should follow their example. It is perfectly clear that man cannot be classed either with the carnivorous animals or the herbivorous animals, nor with the graminivorous animals. His teeth are not constructed for munching and grinding raw grain, nor his digestive organs for assimilating such grain in this condition. He is not even to be classed with the omnivorous animals. He stands apart from all as "The Cooking Animal." All human beings became cooks as soon as they learned how to make a fire, and have continued to be cooks ever since.

The composition of the mother's milk throws much light upon this "vegetable-animal" controversy. The milk prepared for the young of different food-supplying and non-food supplying animals in the laboratory or kitchen of Nature must be regarded as directly adapted to their structure as regards natural food requirements. We find, ready to hand, in Dr. Miller's Chemistry, Vol. III, a comparative statement of the mean of several analyses of the milk of woman, cow, goat, and sheep, from which we quote the following:

Composition.	Woman.	Cow.	Goat.	Sheep.	Dog.
Water.....	88.6	87.4	83.0	85.6	66.3
Fat.....	3.6	4.0	4.5	4.5	14.8
Sugar and soluble salts.....	4.9	5.0	4.5	4.2	2.9
Nitrogenous compounds and insoluble salts.....	3.9	3.6	9.0	5.7	16.0

It is quite evident from the above table that Nature regards our food requirements as approaching much nearer to the herbivora than to the carnivora, and has provided for us accordingly. The food which Nature provides for the human infant differs from that provided for the carnivorous animal in the same way that cooked vegetables and fruit within easy reach of man differ from flesh food.

In practice there are distinctive flesh-eaters among us—none who avail themselves of the higher proportion of albuminoids and fat. All practically admit in eating their ordinary dinner that an excess of nitrogenous matter and fat is bad. They do so by mixing the meat with potatoes, the latter containing an excess of starch (carbo-hydrate) and a small amount of albuminoids and fat. The slice of meat mixed with the lump of potato brings the whole down to the average composition of a fairly arranged vegetarian meal. By a vegetarian repast is not meant mere cabbage and potatoes, but properly selected, well-cooked, nutritious vegeta-

ble food. As an example, take equal weights of beef and potatoes composing the meal, without bread, and we have the following analysis according to the table given by Pavy:

Mixed dinner.	Water.	Albumen.	Starch.	Sugr.	Fat.	Salts.
Lean beef.....	72.00	19.30			3.60	5.10
Potatoes.....	75.00	2.10	18.80	3.20	0.20	0.70
	147.00	21.40	18.80	3.20	3.80	5.80
Mean composition.	73.50	10.70	9.40	1.60	1.90	2.90

Compare with the above the meal furnished to the poor in Munich by Count Rumford's soup (without bread—afterward added), No. 1 composed of equal measures and weights of peas and pearl-barley, or barley meal. Their percentage of composition was as follows:

Rumford's soup.	Water.	Albumen.	Starch.	Sugr.	Fat.	Salts
Peas.....	15.00	23.00	55.40	2.00	2.10	2.50
Barley-meal.....	15.00	6.30	69.40	4.90	2.40	2.00
	30.00	29.30	124.80	6.90	4.50	4.50
Mean composition of mixture.....	15.00	14.65	62.40	3.45	2.25	2.25

Here, then, in one hundred parts of the material of Rumford's half-penny dinner, as compared with the "mixed diet," we have forty per cent. more of nitrogenous food, more than six and a half times as much carbo-hydrate in the form of starch, more than double the quantity of sugar, about seventeen per cent. more of fat, and only a little less of salts (supplied by the salt which Rumford added).

The great German scientific philanthropist states that he found that less than five ounces of solids was sufficient for each man's dinner. He was supplying far more nutritious material than beef and potatoes, and therefore his five ounces were more satisfactory than a pound of beef and potatoes, three-fourths of which is water, for which water the buyer pays a good round price per pound when he buys his prime steak. Count Rumford added the water at pump cost, and, by long boiling claimed to have caused some of it to unite with the solid materials (by the hydration), and then served the combination in the form of porridge, raising each portion to 19¾ ounces. Williams adds one more example for comparison, namely, the Highlander's porridge. The following is the composition of oat meal taken also from Pavy's table:

Water.....	15.00
Albumen.....	12.60
Starch.....	58.40
Sugar.....	5.40
Fat.....	5.60
Salts.....	3.00

If this be compared with the beef and potatoes above, it will be seen that it is superior in every item except the water; this deficiency being readily supplied at the pump. These figures solve a problem that may have suggested itself to some; namely, the smallness of the quantity of dry oat meal that is used in making a large porridge. If we could in like manner see our portion of beef or mutton and potatoes reduced to dryness, the smallness of the quantity of actually solid food required for a meal would be similarly manifest. Williams

continues: "My own experiments on myself, and the multitude of other experiments that I am daily witnessing among men of all occupations, who have cast aside flesh-food after many years of mixed diet, prove incontestably that flesh-food is really unnecessary. On economical grounds, however, the difference is enormous. * * * If all were vegetarians in any country the land would be one of gardens and orchards instead of largely being a grazing ground as at present. Every acre of land would require three or four times as much labor, and feed five or six times as many people.

Dr. B. W. Richardson, F. R. S., a leading and accredited authority on the subject of hygiene, says in his book on *Food Thrift*:

"We have also to learn, as a first truth, that the oftener we go to the vegetable world for our food the oftener we also go to the first, and, therefore, to the cheapest source of supply. The commonly accepted notion that when we eat animal flesh we are eating food at its prime source cannot be too speedily dissipated or too speedily replaced by the knowledge that there is no primitive form of food—albuminous, starchy, osseous—in the animal world itself, and that all the processes of catching an inferior animal, of breeding it, rearing it, keeping it, killing it, dressing it, and selling it, means no more nor less than entirely additional expenditure, throughout, for bringing into what we have been taught to consider an acceptable form of food the veritable food which the animal itself found, without any such preparation, in the vegetable world. With the light of these natural facts filling the national mind, the tendencies of all advanced scholars in thrift should unquestionably be to find out plans for feeding all the community, as far as is possible, direct from the lap of earth; to endeavor to discover how the fruits of the earth may be immediately utilized as food; and to impress science into our service, so that she, in her laboratories, may prepare the choicest viands, minus the necessity of making a lower animal the living laboratory for the sake of what is just a little higher than cannibal propensities."

CHEAP DINNERS FOR SCHOOL CHILDREN.—During the last few years, experiments have been made on an extensive scale in different countries in Europe, in order to test the cost, healthfulness, and popular approval of a system of cheap dinners for the benefit of the national and board schools. The editor of these supplementary volumes is indebted to Mr. George Herbert Sargent, of Birmingham, England, one of the founders and chief promoters of the system, for numerous documents setting forth the results of such experiments in various parts of Great Britain and on the Continent. The limits prescribed for this article permit the insertion of only a few of the many tables reported. In the Kendal District cheap dinners were started for the supply of two country schools about one mile apart. The managers provided the following plant: 100 soup plates; 100 small spoons; one eight-gallon iron pan; one five-gallon can; 20 basins; one pair of scales; two ladies and one bucket. The dinners were served in a vacant cottage, free of rent in each case, near the school, by a woman who was paid 25 cents per day. Fuel cost 35 cents per week. The menu was the following:

On Mondays, Tuesdays, and Thursdays, soup and hash—

Soup.	Hash.
5 lbs. peas,	5 stone potatoes,
3 lbs. barley,	1½ lbs. onions,
2 lbs. bones,	8 oz. salt,
¾ lb. beef dripping,	¾ oz. pepper,
¾ lb. onions,	3 lbs. meat,
6 oz. salt,	
½ oz. pepper.	

On Wednesdays and Fridays, hash and pudding—

Hash.	Pudding.
3½ stone potatoes,	1½ stone flour,
1½ lbs. meat,	1 lb. lard,
1 lb. onions,	2 baking powders,
6 oz. salt,	4 lbs. treacle or preserve,
½ oz. pepper.	Salt.

The quantities given were sufficient for 80 children; the average number present, 72. The pupils

who were able to pay were charged one English penny for a single dinner, or fourpence per week, the dinner being served on the five school days. In case of deficiency caused by free dinners, the lack was supplied from private sources.

Mr. A. F. Hills, of the Thames Ironworks, Blackwall, describes in the "Times" the success of some penny dinners established in that neighborhood upon vegetarian principles. From November to March the experiment was first tried, and, in spite of the difficulties inherent in the organization of a new scheme, proved so popular that the small deficit of some \$15 for the first season, upon 6,500 dinners, was no deterrent to starting them again in the October of the next year. Twelve per cent. of the dinners were gratuitous. The children have varied from seven to boys of 14, and the average attendance has been about 100 per diem. This has been so regular as to prove, not only that the children find the food palatable, but that the parents are quite satisfied with the nutritive and healthful properties of the new diet. The nutritive value of the cereals and pulses (wheat, barley, oats, beans, peas, and lentils) is as three to one when compared with meat; its economy as 18 to one.

In a subsequent letter to the London "Times," Mr. Hills gives, as a result of thorough experiment, the following recipe for the penny meal:

"To make one gallon, take ¼ lb. whole wheat meal and 1 lb. of lentils and boil for two hours, then add 1 lb. of potatoes (mashed) and 1 lb. of mixed vegetables (turnips, carrots, parsnips, etc.). Both potatoes and vegetables should be chopped or grated as fine as possible, and, to make the best soup, should be boiled separately from the grains. Add the vegetables to the grains, and boil for another hour and stir well. Flavor to taste with butter, sweet herbs, and spices. The soup can be varied from day to day by the introduction of other grains—*i. e.*, oats, barley, rice, peas, beans, and maize; and where economy is the first consideration the butter can be substituted by the best refined seed oil, or be omitted altogether. When properly made this soup cannot be distinguished from ordinary stock soup, and contains a far higher value of nutritious food."

Mr. G. H. Sargent had reported from the city of Birmingham in a period of five months a total of about 300,000 school dinners, of which the following were from the kitchen under his own charge:

	Costing.
9,833½ at a halfpenny (paid for), costing about.....	\$102
4,709½ at a halfpenny (free).....	93
30,381 at a farthing (paid for).....	155
104,087 at a farthing (free).....	540
17,210 at 30 for 1s. (free).....	120
166,231	966

His experience is thus summarized:

"In making out a recipe I have much more regard to the solids as a medium for presenting hot water in a wholesome and palatable form than I have to the hot water as a medium for rendering the solids digestible. It is no new theory that the value of a food-stuff should be measured by the quantity of water it will solidify or jellyify. This property is possessed in a singular degree by legumes, and by the other ingredients which I chiefly use, *viz.*, ground Scotch barley and Indian meal; to oatmeal, unfortunately, there is an almost unconquerable aversion amongst the English poor. The water absorbed by the farinaceous foods is presented to the digestive organs in a manner differing totally from that of water taken as a liquid, and it cannot be too constantly borne in mind that the nutritive value of a food depends far more on the suitability of its form for digestion and assimilation than on its chemical composition. Of the results obtained by the practical working out of the theory sketched above the value has been proved by careful observation. It has been found that two or three of our dinners a week given throughout the winter to half-starved children, in addition to what they could get before, change them from a pinched to a fairly well-fed condition, fill them with life and spirits instead of dullness and misery. The popularity of the soups is tested in the simplest way: no compulsion whatever is laid on the children to finish what is given them. They are not pressed or even encouraged—to eat more than they feel an inclination for; yet we rarely find, as we often did when the dinners were far more costly, that any is left. The very cheapest

dinners are by far the most popular. Peas and lentils meet another distinct want. It has been noticed that the children prefer something moderately solid. This legumes just supply; they retain enough hardness when cooked to want biting, but not enough to make them indigestible. They have further these enormous advantages: when one has once learned where to buy and how to cook them, they are very cheap and give very little trouble."

COMPARATIVE VALUE OF CHEESE.—Casein, the substantial basis of cheese, is the consolidated curd of milk, and is one of the most important constituents of animal food, although it is not contained in beef, mutton, poultry, fish or game. It exists in the soluble form in milk, and the insoluble in cheese. It contains more nutritious material than any other food that is ordinarily obtainable, and all that is needed to render it invaluable is the right way of cooking it.

When compared with animal food (excluding bone) the following figures are given, the best parts of the meat being taken in each case: Beef contains, on an average, 72½ per cent. of water; mutton, 73½; veal, 74½; pork, 69½; fowl, 73¼; while Cheshire cheese contains only 30½, and other cheeses about the same. Thus, at starting, we have in every pound of cheese rather more than twice as much solid food as in a pound of the best meat; or, comparing with the average of the whole carcass, including bone, tendons, etc., the cheese has an advantage of three to one.

The following results of Mulder's analysis of casein, when compared with those (by the same chemist) of albumen, gelatine, and fibrin, show that there is but little difference in the ultimate chemical composition of these, so far as the constituents there named are concerned:

Carbon.....	53.83	} Casein.
Nitrogen.....	7.15	
Oxygen.....	15.65	
Sulphur.....	23.37	

Constituents.	Albumen.	Gelatine.	Fibrin.
Carbon.....	53.5	53.40	52.7
Hydrogen.....	7.0	6.94	6.9
Nitrogen.....	15.5	18.34	15.4
Oxygen.....	22.0	24.62	23.5
Sulphur.....	1.6	24.62	1.2
Phosphorus.....	0.4	24.62	0.3

We may therefore conclude that, regarding these from the point of view of nitrogenous or flesh-forming and carbonaceous or heat-giving constituents, these chief materials of flesh and of cheese are about equal.

The same is the case as regards the fat. The quantity in the carcass of oxen, calves, sheep, lambs, and pigs varies, according to Dr. Edward Smith, from 16 per cent. to 31.3 per cent. in moderately fattened animals, while in whole-milk cheeses it varies from 21.68 per cent. to 32.31 per cent., coming down in skim-milk cheeses as low as 6.3. Dr. Smith includes Neufchâtel cheese, containing 18.74 per cent. among the whole-milk cheeses. He does not seem to be aware that the cheese sold under that name is *ricotta*, or crude curd of skim-milk cheese. Its just value is about six cents per pound. In Italy, where it forms the basis of some delicious dishes (such as *budino di ricotta*), it is sold for about twopence per pound or less.

In comparing the nutritive value of cheese with that of flesh, the retention of phosphate of lime nearly corresponds with the retention of the juices of the meat, among which are the phosphates of the flesh. These phosphates of lime are the bone-

making material of food, and have something to do in building up the brain and nervous matter, though not to the extent that is supposed by those who imagine that there is a special connection between phosphorus and the brain, or phosphorescence and spirituality. Bone contains about 11 per cent. of phosphorus, brain less than 1 per cent.

The value of food in reference to its phosphate of lime is not merely a matter of percentage, as this salt may exist in a state of solution, as in milk, or as a solid very difficult of assimilation, as in bones. That retained in cheese is probably in an intermediate condition—not actually in solution, but so finely divided as to be readily dissolved by the acid of the gastric juice. It may be mentioned, in reference to this, that, when a child or other young animal takes its natural food in the form of milk, the milk is converted into unpressed cheese, or curd, prior to its digestion.

Supposing that, on an average, cheese contains only one-half of the six per cent. of phosphate of lime found in the casein, and taking into consideration the water contained in flesh, the bone, etc., we may conclude, generally, that one pound of average cheese contains as much nutriment as three pounds of the average material of the carcass of an ox or sheep as prepared for sale by the butcher; or, otherwise stated, a cheese of twenty pounds weight contains as much food as a sheep weighing sixty pounds as it hangs in the butcher's shop.

Now comes the practical question: Can we assimilate or convert into our own substance the cheese-food as easily as we may the flesh-food? To this question Mr. Williams answers:

"I reply that we certainly cannot if the cheese is eaten raw; but have no doubt that we may if it be suitably cooked. Hence the paramount importance of this part of my subject. A Swiss or Scandinavian mountainer can and does digest and assimilate raw cheese as a staple article of food, and proves its nutritive value by the result; but feeble bipeds of the plains and towns cannot do the like.

"In the fatherland of my grandfather, Louis Gabriel Mattien, one of the commonest dishes of the peasant who tills his own freehold and grows his own food is a 'fondevin.' This is a mixture of cheese and eggs, the cheese grated and beaten into the egg as in making omelets, with a small addition of new milk or butter. It is placed in a little pan like a flower-pot saucer, cooked gently, served as it comes off the fire, and eaten from the vessel in which it is cooked. I have made many a hearty dinner on one of these, *plus* a lump of black bread and a small bottle of genuine but thin wine; the cost of the whole banquet at a little *auberge* being usually less than sixpence. The cheese is in a pasty condition, and partly dissolved in the milk or butter. I have tested the sustaining power of such a meal by doing some very stiff mountain-climbing and long-fasting after it. It is rather too good—over-nutritious—for a man only doing sedentary work.

"A diluted and delicate modification of this may be made by taking slices of bread, or bread and butter, soaking them in a batter made of eggs or milk—without flour—then placing the slices of soaked bread in a pie-dish, covering each with a thick coating of grated cheese, and thus building up a stratified deposit to fill the dish. The surplus batter may be poured over the top; or, if time is allowed for saturation, the trouble of preliminary soaking may be saved by simply pouring all the batter thus. This, when gently baked, supplies a delicious and highly nutritious dish. We call it cheese-pudding at home, but my own experience convinces me that we make a mistake in using it to supplement the joint. It is far too nutritious for this; its savory character tempts one to eat it so freely that it would be far wiser to use it as the Swiss peasant uses his *fondevin*—that is, as the one and only dish of a good, wholesome dinner.

"I have tested its digestibility by eating it heartily for supper. No nightmare has followed. If I sup on a corresponding quantity of raw cheese, my sleep is miserably eventful."

USE OF SALT IN FOOD.—The value of salt in connection with our food is much greater than is generally understood among the common people. Common salt is the most widely distributed substance in the body; it exists in every fluid and in every solid; and not only is it everywhere present, but in almost every part it constitutes the largest

portion of the ash when any tissue is burned. In particular, it is a constant constituent of the blood, and it maintains in it a proportion that is almost wholly independent of the quantity that is consumed with the food. The blood will take up so much and no more, however much we may take with our food; and, on the other hand, if none be given, the blood parts with its natural quantity slowly and unwillingly. Under ordinary circumstances, a healthy man loses daily about 12 grains by one channel or the other, and, if he is to maintain his health, that quantity must be introduced.

Common salt is of immense importance in the processes ministering to the nutrition of the body, for not only is it the chief salt in the gastric juice, and essential for the formation of bile, and may hence be reasonably regarded as of high value in digestion, but it is an important agent in promoting the processes of diffusion, and therefore of absorption. Says the London "Lancet":

"Direct experiment has shown that salt promotes the decomposition of albumen in the body, acting, probably, by increasing the activity of the transmission of fluids from cell to cell. Nothing can demonstrate its value better than the fact that, if albumen without salt is introduced into the intestine of an animal no portion of it is absorbed, while it all quickly disappears if salt be added. If any further evidence were required, it would be found in the powerful instinct which impels animals to obtain salt. Buffaloes will travel for miles to reach a "salt-lick"; and the value of salt in improving the nutrition and the aspect of horses and cattle is well known to every farmer. The popular notion that the use of salt prevents the development of worms in the intestine has a foundation in fact, for salt is fatal to the small thread worms, and prevents their reproduction by improving the general tone and the character of the secretions of the alimentary canal. The conclusion, therefore, is obvious that salt, being wholesome, and indeed necessary, should be taken in moderate quantities, and that abstinence from it is likely to be injurious."

DIET FOR THE GOUTY.—Extended and carefully noted experience seems to show that persons troubled with what is called *lithic acid diathesis* may receive invaluable benefit by the use (under the direction of competent and conscientious physicians) of pot-ash salts. Lithic acid (stony acid) combines with potash, forming a solid salt, which is safely excreted. Otherwise it is deposited in some part of the system, producing rheumatism, stone, gravel, gout, and other chronic and exceedingly troublesome diseases. The potash required for the purpose exists in several conditions: First, in its uncombined state as caustic potash. This is poison, for the simple reason that it combines so vigorously with organic matter that it would decompose the digestive organs themselves if presented to them. The lower carbonate is less caustic, the bicarbonate nearly, but not quite, neutral. Even this, however, should not be taken as food, because it is capable of combining with the acid constituents of the gastric juice.

The proper compounds to be used are those which correspond to the salts existing in the juices of vegetables and flesh, namely: compounds of potash with *organic* acids, such as tartaric acid, which forms the potash salt of the grape; such as citric acid, with which potash is combined in lemons and oranges; malic acid, with which it is combined in apples and many other fruits; the natural acids of vegetables generally; lactic acid in milk, etc. All these acids and many others of similar origin, are composed of carbon, oxygen, and hydrogen, held together with such feeble affinity that they are easily dissociated or decomposed by heat. This may be shown by heating some cream of tartar or tartaric acid on a strip of metal or glass. It will become carbonized to a cinder, like other organic matter. If the heat is raised sufficiently, this cinder will all burn away to carbonic acid, and water

in the case of pure acid, or will leave carbonate of potash in the case of cream of tartar or other potash salt.

This represents violently what occurs gradually and mildly in the human body, which is in a continuous state of slow combustion so long as it is alive. The organic acids of the potash salts suffer slow combustion, give off their excess of carbonic acid and water to be breathed out, evaporated, and ejected, leaving behind their potash, which combines with the otherwise stony lithic acid tormenter just when and where he comes into separate existence by the organic actions which effect the above-described slow combustion.

If potash be taken in combination with a mineral acid, such as the sulphuric, nitric, or hydrochloric no such decomposition is possible; the bonds uniting the elements of the mineral acid are too strong to be sundered by the mild chemistry of the living body, and the mineral acid, if separated from its potash base, would be most mischievous, as it precipitates the lithic acid in its worst form. For this reason all free mineral acids are poisons to those who have a lithic acid diathesis; they may even create it where it did not previously exist. Hence the iniquity of cheapening the manufacture of lemonade, ginger-beer, etc., by using dilute sulphuric or hydrochloric acid as a substitute for citric or tartaric acid.

Speaking generally, it is not to the laboratory of the chemist that we should go for our potash salts, but to the laboratory of Nature, and more especially to that of the vegetable kingdom. They exist in the green parts of all vegetables. This is illustrated by the manufacture of commercial potash from the ashes of the twigs and leaves of timber trees. The more succulent the vegetable the greater the quantity of potash it contains, though there are some minor exceptions to this. We extract and waste a considerable portion of these salts when we boil vegetables and throw away the *potage*, which our wiser and more thrifty neighbors add to their every-day menu. When we eat raw vegetables, as in salads, we obtain all their potash.

Fruits generally contain important quantities of potash salts, and it is upon these especially that the possible victims of lithic acid should rely. Lemons and grapes contain them most abundantly. Those who cannot afford to buy these as articles of daily food may use cream of tartar, which, when genuine, is the natural salt of the grape.

Intimately connected with this subject is another vegetable principle—vegetable jelly, or *pectin*; the jelly of fruits, of turnips, carrots, parsnips, etc. Frey has named it *pectose*. It is so little changed by cookery that an acid may be separated from it which has been named "pectic acid," the properties and artificial compounds of which appear to suggest the theory that the natural jelly of fruits largely consists of pectites of potash or soda or lime. We all know the appearance and flavor of current jelly, apple jelly, etc., which are composed of natural vegetable jelly plus sugar.

The separation of these jellies is an operation of cookery, and one that deserves more attention than it receives. W. Mattieu Williams says: "I shall never forget the *rahat lakoum* which I once had the privilege of eating in the kitchen of the seraglio of Stamboul, in the absence at the summer palace of the sultana and the other ladies for whom it was prepared. Its basis was the pure pectose of many fruits, the inspissated juices of grapes, peaches, pineapples, and I know not what others. The sherbet was similar, but liquid."

Mr. Gladstone's advocacy of the extension of fruit culture should be remembered. We shame-

fully neglect the best of all food in eating and drinking so little fruit. As regards cooked fruit, "jam for the million, jelly for the luxurious, and juice for all." With these in abundance, the abolition of alcohol will follow as a necessary result of natural nausea.

WASTE OF THE BODY.—Seguin inclosed himself in a bag of glazed taffeta which was tied over him, no other opening than a hole corresponding to his mouth, the edges of which were glued to his lips. He carefully weighed himself before and after his inclosure. He found that the largest quantity of insensible exhalations from the lungs and skin together amounted to three and a half ounces per hour, or five and a quarter pounds per day; the smallest quantity was one pound fourteen ounces; and the mean, three pounds and eleven ounces. Three-fourths of this was cutaneous.

Valentin found that his hourly loss by cutaneous exhalation, while sitting, amounted to 32.8 grams, or rather less than one and a quarter ounce. On taking exercise, with an empty stomach in the sun, the hourly loss increased to 89.3 grams, or nearly three times as much. After a meal followed by violent exercise, with the temperature of the air at 72° Fahrenheit, it amounted to 132.7 grams, or nearly four and a half times as much as during repose. A robust man, taking violent exercise in hot weather, may give off as much as five pounds in an hour.

The third excretion from the skin, the epithelial or superficial scales of the epidermis, is small in weight, but it is solid, and of similar composition to gelatin. It should be understood that this increases largely with exercise.

STRENGTH, OR WORK FORCE, OBTAINED FROM FOOD.—A practical dietary or *menu* seems to be demanded, say, for athletes in full work, another for sedentary people doing little work of any kind.

According to the results from the experiments by Joule and Frankland, the best possible food for the first class is fat, butter being superior to lean beef in the proportion of 14.421 to 2.829 (Smith), beef-fat having nearly eight times the value of lean beef. Ten grains of rice give 7.454 foot pounds of working power, while the same quantity of lean beef gives only 2.829; according to which one pound of rice should supply as much support to hard workers as two and a half pounds of beef-steak.

THE POSSIBLE FOOD SUPPLY.—The productive agricultural area of the world is 46,000,000 square miles, of which 28,000,000 are fertile enough to produce 25 bushels of wheat per acre. The estimated population of the world is 1,468,000,000. The known productive area of the world would feed nearly 6,000,000,000, or nearly four times the present population, without any increase in the present inferior product, which, if doubled by good cultivation, would be sufficient for a population of 12,000,000,000, or more than eight times the present number of the human race. A distinguished gentleman in a recent address before the British Association, after expressing his acceptance of the above estimates as reliable, argued that there is no room at present for the fear that population will overtake the production of food, and that farmers will enjoy the privilege of putting their own price upon their products. On the contrary, he thinks that production will, for a long time to come, be actually in advance of the requirements of the population.

FOOLS, FESTIVAL OF, a mediæval Christian feast, simulating the saturnalia, celebrated in many countries of Europe, but particularly in France. It fell chiefly on the 1st of January in each year, but more or less occupied the whole period be-

tween Christmas and Epiphany. In its observance, the chief performers were of the lower clerical orders, and the professed aim was to interest the young and the ignorant in the Advent, but it became a mere travesty of all the more sacred rites of Christianity, and was condemned by prelates and councils.

FOOL'S PARSLEY, an umbelliferous plant, a common poisonous weed in gardens and fields in most parts of Europe. It resembles parsley in its foliage and general appearance, so that serious accidents have occurred from its being mistaken for that herb.

FOOT: in music, a term used in the same way as in poetry, denoting a sort of melodic figure of notes with only one accent. Foot is also used in speaking of the pitch of sounds. The Germans have always used the word *Fusston* in representing the pitch of the different stops of an organ. As a unison stop is called an eight-foot stop, because in this case the pipe is about eight feet long, an octave stop is called a four-foot stop, a double or suboctave stop a 16-foot stop, etc.

FOOTE, ANDREW HULL (1806-63), a U. S. naval officer. He entered the navy as midshipman in 1822, became lieutenant in 1830, and in 1849 was made captain. At the beginning of the civil war he was put in command of the Western flotilla. In 1862 he received a vote of thanks from Congress for services rendered, and was made rear-admiral. In the following year he was chosen to succeed Rear-Admiral Dupont; but while on his way to assume command of the fleet, which was off Charleston, he died of a wound received a year previous.

FOOTE, HENRY STUART (1800-80), a U. S. Senator. He was admitted to the bar in 1822; acquired an extensive practice in Jackson, Miss., and in 1844 was a Presidential elector. From 1847 to 1852 he was a U. S. Senator, and then served as governor of his State till 1854. He was subsequently a member of the Confederate Congress. After the civil war Gen. Grant made him superintendent of the U. S. Mint at New Orleans. He held this position till shortly before his death.

FOOTE, SAMUEL AUGUSTUS (1780-1846), a U. S. Senator. He served in the Connecticut legislature for several years, and in 1819-21, and again in 1823-25, was a member of Congress. In 1827-33 he occupied a seat in the U. S. Senate. He was again in Congress in 1833-34, and then was governor of Connecticut for one term. In 1844 he was a Presidential elector.

FOOTE, WILLIAM HENRY (1794-1869), an American Presbyterian clergyman. He was licensed to preach in 1818, and in 1824 was ordained pastor of the church at Romney, W. Va. In 1838 he became agent of the central board of foreign missions of the Presbyterian church. From 1845 to 1861 he was again pastor at Romney, and superintendent of the academy. In the latter year he was chosen agent for Hampden-Sidney College.

FOOT-WASHING (see MAUNDY THURSDAY, Britannica, Vol. XV, pp. 635-36). The washing of feet, as a religious ceremony, is regularly practiced by the Dunkers and the Winebrennarians or Church of God, to commemorate Christ's washing of the feet of his disciples as recorded in John 13:4-17.

FORAGE, hay, straw, and oats, supplied to horses of officers and soldiers in the army. Where troops are together the provisions of forage devolves on the commissariat. Officers of the staff, etc., who are entitled to horses, but whose duties are at stations where bodies of horses are not collected, receive a money allowance, in lieu of forage.

in kind, varying according to the place and price of provender.

FORAGE CROPS. See GRASSES, in these Revisions and Additions.

FORAKER, JOSEPH BENSON, ex-governor of Ohio, born in 1846. He entered the army when sixteen years of age, and served to the end of the war. He attained the brevet rank of captain, and when his regiment was mustered out he was aid on Gen. H. W. Slocum's staff. In 1869 he was admitted to the bar, and from 1879 to 1882 was judge of the Cincinnati superior court. He was governor of Ohio from 1886 to 1890.

FORAMEN: in anatomy, any natural opening through a bone, especially a nerve-passage.

FORBES, ARCHIBALD, an eminent journalist, born in Morayshire, Scotland, in 1838, and educated at Aberdeen. He served some years in the Royal Dragoons. He was correspondent of the *Daily News* through the Franco-Prussian war, during the Prince of Wales's Indian tour, and in the Russo-Turkish and South African campaigns. In 1879 he rode 110 miles in 15 hours to report the victory of Ulundi. He has published a number of books detailing his experiences, and has lectured in Great Britain, America and Australia.

FORCE, PETER (1790-1868), an American historian. For a time he was foreman of a printing office in Bloomingdale, N. J., and in 1812 was president of the New York Topographical Society. In 1815 he removed to Washington, D. C. Here he was engaged in the publishing business, and from 1823 to 1830 edited and published the "National Journal." In 1833 he was authorized by Congress to compile a vast work, to be called the *American Archives, a Documentary History of the English Colonies in North America*, covering a period from the discovery of America to the final ratification of the Constitution of the United States. About one-fourth of Mr. Force's work was completed when it was discontinued by Secretary Marcy. His collection of material was sold to Congress for \$100,000. He published other works of historical importance. In 1836-40 he was mayor of Washington.

FORCENÉ, said, in heraldry, of a horse when rearing, or standing on his hind legs.

FORCING: in gardening, the artificial application of heat to accelerate vegetation. Many of the fruits and vegetables which grow well in the open air are very commonly forced in order that they may be procured at seasons when they could not be without artificial means.

FORD, FORDING. When a river or rivulet is crossed without the aid of either a bridge or ferry it is said to be forded, and an established place for this crossing is called a ford. To the military engineer and the traveler in wild countries, the selection of the safest place for fording a river is a matter of some practical importance. The widest part of the river should be chosen, as, wherever a certain quantity of water is flowing, the wider its bed, the rapidity of the flow being the same, the more shallow it must be.

FORD, MELBOURNE H., a lawyer, born in Saline, Mich., June 30, 1849. He was educated at the Michigan Agricultural College and the United States Naval Academy; served in the United States Navy during the latter part of the civil war; entered the profession of law in 1878, and was for several years official stenographer of different Michigan courts. In politics a Democrat, he was elected a member of the State legislature in 1885 and 1886. He was elected a representative from the Fifth Congressional District of Michigan to the 50th, and in 1890 was elected from the same District to the 52d Congress.

FORDHAM, 10 miles from Grand Central Depot, New York, was in 1874 annexed to that city. It contains St. John's College, a Roman Catholic theological school, academy for ladies, female deaf-mute asylum, and other educational institutions.

FORE, a term applied to the front or foremost part of a ship. The *forecastle* is that portion of the upper deck extending from the foremast to the bow. The *forehold* is that part of the hold intervening between the cutwater and the foremast. *Foremast* is the first of the three masts. The *fore-braces* are ropes passing from the extremities of the foreyard into the maintop, whence they descend through pulleys to the deck, where they serve, when necessary, to alter the direction presented by the foresail to the wind.

FOREKNOWLEDGE, knowledge that precedes the occurrence of the thing known; the absolute knowledge, or the omniscience of God.

FORELAND, North and South, two promontories of England, on the east coast of Kent, between which are the Downs and Goodwin Sands. North Foreland, in lat. 51° 22' N. and long. 1° 28' E., consists of chalky cliffs, nearly 200 feet high, upon which is erected a light-house 85 feet high. South Foreland, 16 miles south of North Foreland, in lat. 51° 8' N., 1° 22' E., also has a light-house.

FOREST-FLY, or HORSE-FLY, a dipterous insect, parasitic on horses, oxen, etc., frequent in forests. It is a small insect, about four lines long, of a shining brown color, with some yellow. The insect passes the larval stage and becomes a pupa within the mother.

FOREST MARBLE, a member of the Lower Oolite. The principal bed is a fissile limestone, containing large numbers of dark-colored shells, and capable of sustaining a fine polish. On this account it is used to some extent as "marble." It is interstratified with blue marls and shales, and fine oolitic sandstones. The whole thickness of the group seldom exceeds forty feet.

FOREST OAK, a name sometimes given in commerce to the timber of *Casuarina torulosa*, and other species of *Casuarina*, Australian trees. This timber, which is a light yellowish-brown, and prettily marked with short red veins, is used for ornamental work.

FORESTRY. On Jan. 1, 1891, the forest area in the United States was, according to a careful estimate made by the chief of the Forestry Division, United States Department of Agriculture, 481,764,599 acres. The present annual requirements for consumption of forest products in the United States are, approximately, over 20,000,000,000 cubic feet, made up of the following items: Lumber market and manufactures, 2,500,000,000 cubic feet; railroad construction, 500,000,000 cubic feet; charcoal, 250,000,000 cubic feet; fences, 500,000,000 cubic feet; fuel, 17,500,000,000 cubic feet; mining timber, 150,000,000 cubic feet. In addition to these items of consumption, forest fires annually destroy the products of hundreds of thousands of acres of forest. At the present rate of destruction, therefore, the remainder of forest land in the United States cannot long meet the enormous demands on its resources. Some of the most important timbers for building purposes are already practically extinct, such as the merchantable white pine of the Northwest and of New England, while of the long-leaf pine of the South only about 1,500,000,000 cubic feet remain.

Various measures have been adopted for the preservation of the forests. In 1885 the State of New York instituted a Forest Commission, with extensive powers. California, Colorado, and New

Hampshire have also created Forest Commissions, while Ohio, Kansas, and Pennsylvania have Forestry Bureaus. For several years a national organization, known as the American Forestry Association, composed of delegates from each of the States, has met annually, the ninth annual meeting having been held at Washington, D. C., in December, 1890. In order to encourage forest planting on the treeless prairies of the West, the Timber Culture act, of the United States provides that a citizen, or one who has declared his intention to become such, if the head of a family, or a single person over twenty-one years of age, may acquire title to 160 acres of the public domain, on cultivating 10 acres of trees thereon for eight years. That this enactment has not been barren of results will appear from the following statement of the number of acres entered annually under the Timber Culture act, from July 1, 1872 to June 30, 1890, inclusive:

Year ending June 30.	Acres.	Year ending June 30.	Acres.
1873	50,246	1883	2,546,686
1874	81,226	1884	3,110,930
1875	473,694	1885	4,081,464
1876	599,918	1886	4,755,006
1877	524,552	1887	5,391,309
1878	1,902,038	1888	4,224,337
1879	2,775,038	1889	3,735,305
1880	2,169,484	1890	2,551,069
1881	1,763,793	1891	1,797,403

In 1874 the Nebraska State Board of Agriculture recommended that the second Wednesday of April in each year be designated as a day to be dedicated to the planting of trees. The suggestion was adopted, and since then no less than 37 of the States and Territories have, by legislative enactment or otherwise, set apart a day to be annually devoted to tree-planting, known as Arbor Day. Latterly the interest in this annual observance has been greatly augmented by inducing the pupils of the public schools to take part in its celebration.

INFLUENCE OF FORESTS ON WATER SUPPLY.—That forests increase the rainfall of a region is now generally conceded. In the annual report of the Secretary of Agriculture for the year 1889, the Chief of the Forestry Division says that the water capital of the earth consists of fixed capital and circulating capital. The first is represented not only in the waters on the earth, but also by that amount of water which remains suspended in the atmosphere, being part of the original atmospheric water masses which, after the rest had fallen to the cooled earth, remained suspended and is never precipitated. The circulating water capital is that part which is evaporated from water surfaces, from the soil, from vegetation, and which, after having temporarily been held by the atmosphere in quantities locally varying according to the variations in temperature, is returned again to the earth by precipitation in rain, snow and dew. There it is evaporated again, either immediately or after having percolated through the soil and been retained for a shorter or longer time before being returned to the surface; or, without such percolation, it runs through open channels to the rivers and seas, continually returning in part into the atmosphere by evaporation. Practically, then, the total amount of water capital remains constant; only one part of it—the circulating capital—changes in varying quantities its location, and is of interest more with reference to its local distribution, and the channels by which it becomes available for human use and vegetation, than with reference to its practically unchanged total quantity.

As to the amount of this circulating water capital we have no knowledge; hardly an approximate estimate of the amount circulating in any given lo-

cality is possible with our present means of measurement; for it appears that so unevenly is the precipitation distributed that two rain-gauges almost side by side will indicate varying amounts, and much of the moisture which is condensed and precipitated in dews escapes observation or at least measurements entirely. Thus it occurs that while the amount of water calculated to be discharged annually by the River Rhone into the sea appears to correspond to a rain-fall of 44 inches, the records give only a precipitation over its water-shed of 27.6 inches.

The distribution of the circulating water capital is influenced by various agencies. The main factor which sets the capital afloat is the sun, which, by its heat and the air currents caused by it, and by the rotation of the earth, produces the evaporation which fills the atmosphere with vapor. Anything, therefore, that influences the intensity of insolation, the action of the sun, or obstructs the passage of winds, must influence the local distribution of the water capital. The great cosmic influences which produce the variability of all climatic conditions, and therefore also of the circulating water capital, are the positions of the earth's axis to the sun, by which the angle and therefore the heat value of the sun's rays vary in different parts of the earth and at different times of the year; the distribution of land and water areas, which produces a difference of insolation because the water has less heat capacity than the land, and which also influences the direction of air and sea currents; and the configuration of the earth, by which the density of the atmosphere is made unequal, and in consequence of which differences of insolation and of air temperature are induced. Thus we have not only climatic zones, but also continental climates and mountain climates, in opposition to coast climates and plains or valley climates. Among the factors which modify the cosmic climate and help to produce a local climate differing from other local climates, the soil-cover, especially the presence of forest areas, is one that, under certain conditions, is potent.

In the discussions which have prevailed hitherto it has been overlooked that the idea of what constitutes a forest is not only an exceedingly variable one, but that without a definite understanding of what constitutes the forest we cannot discuss its influence. It is clear that the influence of the forest, if any, will be due mainly to its action as a cover protecting soil and air against insolation and against winds. That the nature of a cover, its density, thickness, and its proper position, has everything to do with the amount of protection it affords will readily be admitted. A mosquito net is a cover, so is a linen sheet or a woolen blanket, yet the protection they afford is different in degree and may become practically none. It will also be conceded that it makes a great difference whether the cover be placed before or behind the wind. Just so with the influence of the forest; it makes all the difference whether we have to do with a deciduous or a coniferous, a dense or an open, a young low or an old high growth, and what position it occupies with reference to other climatic elements, especially to prevailing winds and water surfaces. In this discussion, unless differently stated, when the word forest is used a dense growth of timber is meant.

The question of forest influence on water supplies can be considered under three heads, namely, influence upon precipitation or distribution of atmospheric water; influence upon conservation of available water supplies, and influence upon the distribution or "run-off" of these supplies.

INFLUENCE UPON PRECIPITATION: New evidence is constantly accumulating which shows that under certain conditions forest areas obtain larger precipitations than open grounds—that is, they increase at least the amount of precipitation over their own immediate and near-lying areas. Of the prominent meteorologists who believe in such an influence, is the well known Russian, Dr. A. Woeikoff, from whose latest publication, *Climates of the Earth*, published in the Russian language, we quote:

It would appear as if in winter the difference in the amount of rainfall within and without the woods cannot be great, as the absolute amount of vapor is small and the difference between the relative humidity within and without the woods is insignificant. This is, however, not the case, for two reasons: First, the clouds float in winter at a lower level than in summer, hence the mechanical resistance presented by the woods is more effective in winter, as it can more easily reach the strata of the atmosphere in which the clouds are moving. This resistance causes the air to rise and thus favor the formation of precipitation. Secondly, in winter the prevailing winds are generally charged with moisture and precipitation is of longer duration, so that the above-named causes act for a longer time.

In the spring and beginning of winter the woods contribute more or less to the increase of precipitation. At this time of the year evaporation is very actively going on outside the woods on the surface of the meadows and fields. During the winter the soil has been well stocked with moisture, which is now evaporated by the action of the processes of vegetable life and the direct action of the sun. It is probable that during this period both the possible and the actual evaporation are greater without than within the forest, evaporation being here understood as the sum of all water evaporated both by the soil and the plants from a given area.

In the middle of summer or toward the beginning of autumn the soil outside the woods begins partly to dry up, and cannot any more yield as much moisture for the evaporation of the plants as in the beginning of summer; on the other hand, the vegetable processes following upon the blooming (the ripening of the seeds) require less moisture. But in the leaved woods evaporation continues in full force to the end of the summer, and in coniferous woods the evaporating surface remains approximately the same in the course of the whole year; at the same time the moisture preserved in the soil through shade and protection from wind continues to furnish sufficient material for evaporation. Consequently, just at the time when meadows and fields begin to evaporate less, it goes on as before in the forests. This gives rise to a great difference between the amount of moisture contained in the air within and near the woods, and outside the woods in open places. Moist air more easily reaches the point of saturation and condensation than dry air.

The following point is also to be noticed. Forests, especially pine woods, must condense a great deal of moisture in winter when air nearly saturated with vapor passes over them; this gives rise to copious formations of hoarfrost, which will fall to the ground and increase the mass of snow in the woods. This phenomenon has never been accurately observed and measured; but careful observation will convince anybody that wherever the temperature for several consecutive months remains below zero (as is the case in Northern Europe), a considerable amount of hoarfrost is in this way collected, since the air is highly charged with moisture, and besides, the average force of the wind is greater in winter than in any other season.

In hot and moist climates, where the absolute amount of vapor in the air is great (for instance in many tropical countries), the enormous surface presented by the leaves of forest trees condenses a great quantity of water on every clear and calm night, so that this water cannot be retained on the leaves and falls to the ground; the observer gets the impression of a heavy rainfall. This was specially pointed out by the celebrated Boussingault, who observed it in South America. Thus, a certain part of the moisture evaporated by the leaves during the day returns at night, and the dew is so copious as to moisten the soil under the trees.

Dr. Woeikoff then goes on to show that in tropical and sub-tropical countries the presence of woods has a far greater influence in mitigating the temperature during the hot and dry months of April and May than the proximity of the sea.

Without further discussing the influence of the forest upon quantity and distribution of rainfall, it may be said that many observations and the philosophy of meteorological forces lend countenance to the following statements:

(1) During the time of vegetation large quantities of vapor are transpired and evaporated by a forest, by which the absolute humidity of the air above the forest is increased; and since, on ac-

count of the cooler temperature which prevails over and within a forest, the relative humidity is also greater, the tendency to condensation is increased.

(2) This moister and cooler air stratum communicated to the neighboring locality must increase the dew, at least, over the neighboring field.

(3) This relatively moister air stratum, carried away by air currents, has the tendency to induce precipitation at such places, especially where the additional influence favorable to precipitation—namely, increased altitude—exists; therefore,

(4) While the forest may not everywhere increase precipitation over its own area, yet a large system of forests over an extensive area will influence the quantity of precipitation over and within this area.

(5) It must never be overlooked that there are certain rain conditions prevailing in climatic zones (rainy or rain-poor localities, with periodical, seasonal, or irregular rains) which are due to cosmic influences and cannot be altered, but may be locally modified by forest cover. Hence, experiences in one climatic zone cannot be utilized for deductions in another.

DISPOSAL OF WATER SUPPLIES: Given a certain amount of precipitation in rain or snow over a certain area, the disposal of the water after it has fallen and the influence of the forest cover on its disposal require our attention. For the sake of convenience the elements which need consideration may be divided into elements of dissipation, elements of conservation, and elements of distribution. The difference in effect between the first two classes of elements will give an idea of the amount of available water supply or run-off resulting from precipitation; while the third class bears upon the methods of distributing the available water supply.

Elements of dissipation are those which diminish the available water supplies; they are represented in the quantity of water which is prevented by interception from reaching the ground, in the quantity dissipated by evaporation, in the quantity used by plants in their growth, and in transpiration during the process of growing. The amount of rainfall and snow which is prevented by a forest growth from reaching the soil varies considerably according to the nature of the precipitation and to the kind of trees which form the forest, as well as to the density and age of the growth. A light drizzling rain of short duration may be almost entirely intercepted by the foliage and at once returned to the atmosphere by evaporation; if, however, the rain continues, although fine, the water will run off at last from the foliage and along the trunks. This amount, of which the rain-gauge takes no account, represents, according to measurements of the Austrian stations, from 8 to 14 per cent.; thus reducing considerably the loss to the soil.

While the careful measurements at the Swiss stations in a 12 years' average show the interception in a larch forest as 15 per cent., in a spruce forest 23 per cent., in a beech growth 10 per cent.; the figures for the Prussian stations are, for beech growth, 24 per cent., and for spruce at various stations 22 per cent., 27 per cent. and 34 per cent., respectively. Altogether, for the rainfall conditions of the countries cited, a dense forest growth will, on the average, intercept 23 per cent. of the precipitation; but if allowance be made for the water running down the trunks, this loss is reduced to not more than 12 per cent.

The amount of interception in the open growths which characterize many of our western forest areas would be considerably smaller, especially as

the rains usually fall with great force, and much of the precipitation is in the form of snow. Although branches and foliage catch a goodly amount of this, the winds usually shake it down, and consequently but very little snow is lost to the ground by interception of the foliage.

There is also a certain amount of water intercepted by the soil cover and held back by the soil itself, which must be saturated before any of it can run off or drain away. This amount, which is eventually dissipated by evaporation and transpiration, depends, of course, upon the nature of the soil and its cover, especially upon their capacity to absorb and retain water.

The loss by evaporation, after the water has reached the ground, depends, in the first place, upon the amount of direct insolation of the soil; hence its temperature, which again influences the temperature of the air. If the loss by evaporation from an open field be compared with that of a forest-covered ground, it will, as a matter of course, be found to be less in the latter case, for the shade not only reduces the influence of the sun upon the soil, but also keeps the air under its cover relatively moister, therefore less capable of absorbing moisture from the soil by evaporation. In addition, the circulation of the air is impeded between the trunks; and this influence upon available water supply—the wind-breaking power of the forest—must be considered as among the most important factors of water preservation. Especially is this the case on the Western plains, and on those Western mountain ranges bearing only a scattered tree growth, and where, therefore, the influence of shade is but nominal.

The evaporation under the influence of the wind is dependent not only on the temperature and dryness of the same, but also on its velocity, which, being impeded, the rate of evaporation is reduced. Interesting experiments for the purpose of ascertaining the changes in the rate of evaporation effected by the velocity of the wind were made by Prof. T. Russell, Jr., of the United States Signal Service, in 1887. These experiments were made with Piche's hygrometers whirled around on an arm 28 feet in length, the results of which were compared with those from a tin dish containing 40 cubic centimeters of water exposed under shelter. These results were obtained: with the temperature of the air at 84 degrees and a relative humidity of 50 per cent., evaporation at 5 miles an hour was 2.2 times greater than in a calm; at 10 miles, 3.8; at 15 miles, 4.9; at 20 miles, 5.7; at 25 miles, 6.1; and at 30 miles the wind would evaporate 6.8 times as much water as a calm atmosphere of the same temperature and humidity. As the average velocity of the winds which constantly sweep the Western sub-arid plains is from 10 to 15 miles, not rarely attaining a maximum of 50 and more miles, the cause of the aridity is not far to seek, and the function of the timber belt, or even simple wind-break, can be readily appreciated.

The degree of forest influence upon rate of evaporation by breaking the force of winds is dependent upon the extent and density of the forest, and especially on the height of the trees; for according to an elementary law of mechanics, the influence which breaks the force of the wind is felt at a considerable elevation above the trees. This can be practically demonstrated by passing along a timber plantation on the wind-swept plains. Even a thin stand of young trees not higher than five feet will absolutely calm the air within a considerable distance and height beyond the shelter.

The following extract from the letter of a farmer in Illinois to the United States Secretary of Agri-

culture indicates the actual experience of the Western farmers in regard to the value of wind-breaks on the prairies and plains:

My experience is, that now in cold and stormy winters wheat protected by timber belts yields full crops, while fields not protected yield only one-third of a crop. Twenty-five or thirty years ago we never had any wheat killed by winter frost, and every year a full crop of peaches, which is now very rare. At that time we had plenty of timber around our fields and orchards, now cleared away.

The damage done to crops by the cold, dry winter winds is mainly due to rapid evaporation, and plants are liable to suffer as much by winter drought as by summer drought. Rationally disposed timber belts alone will do much to increase available water supply by reducing evaporation.

Various experiments comparing the rate of evaporation within and without a forest are recorded in the following table, which refers to evaporation from a water surface in the open field on the one hand and within the shelter of the forest on the other. It is shown that under ordinary circumstances evaporation may, under forest cover, be decreased from two to three times.

Evaporation of a water surface from April to October, expressed in centimeters:

District.	Without the Forest.	Within the Forest.	Ratio.
Eastern France.....	41.2	13.2	312 to 100
Alsatian Mountains.....	33.5	15.9	211 to 100
Bavaria.....	37.7	15.8	239 to 100
Brandenburg.....	29.9	16.3	245 to 100
Silesian Mountains.....	25.7	10.6	250 to 100
Eastern Prussia.....	25.2	12.0	210 to 100

The reason for this influence of the forest, as has been stated, is due not only to the impeded air circulation, but also to the temperature and moisture conditions of the forest soil and forest air. The greater humidity of the atmosphere under forest cover tends also to reduce evaporation. The temperature, especially during the warm months, being considerably lower in the forest interior, the air receives less moisture in proportion from the soil and lower vegetation. A cubic foot of forest air contains in the average less moisture than a cubic foot of air over a cultivated field under otherwise similar conditions. While thus the absolute amount of moisture in the forest air is really less, the relative humidity is greater; that is, the air of the forest being of lower temperature is nearer the state of saturation.

All vegetation takes up a certain amount of water, a part of which is consumed in building up its body, and a still larger part returned to the atmosphere by transpiration during the process of growth. The quantity of water so used is as variable as the amount of precipitation, and, in fact, within certain limits depends largely upon it. That is to say, a plant will transpire in proportion to the amount of water which is at its disposal. Transpiration is also dependent on the stage of development of the plant, on the nature of its leaves and amount of its foliage, on temperature, humidity, and circulation of the air, on intensity of the sunlight, and on temperature and structure of the soil, and other meteorological conditions. Rain and dew reduce transpiration, wind increases it. The amounts transpired by agricultural crops and other low vegetation, weeds, etc., are exhibited in

the following table, which gives the results of the latest investigations by Wollny:

Agricultural crops.	Time of vegetation.	Water consumption per acre.
		Pounds.
Winter rye.....	April 20-Aug. 3, 1879	2,590,186
Barley.....	April 20-Aug. 3, 1879	2,720,238
Peas.....	April 20-Aug. 3, 1879	3,144,128
Red clover (1st season)	April 20-Oct. 1, 1879	3,070,012
Summer rye.....	April 20-Aug. 14, 1880	3,000,486
Oats.....	April 20-Sept. 14, 1880	3,422,584
Beans.....	April 20-Sept. 10, 1880	3,139,293
Red clover (2d season)	April 20-Oct. 1, 1880	4,109,198

Since this water is given off again to the atmosphere in the locality where it has fallen—thus re-enriching the atmospheric moisture—it may be considered as part of the circulating water capital, which does its duty in producing useful substance and in conserving moisture for the locality.

There is one other element of conservation effecting water supplies which requires special mention. This is the retardation in the melting of the snow which is due to forest-cover. According to Dr. Buehler, of Zurich, this retardation in Switzerland amounts to from five to eight days in general, and may, according to weather conditions, be several weeks, thus giving a longer period for distribution. The evergreen coniferous forest in this respect naturally does better service than the deciduous one.

ELEMENTS OF DISTRIBUTION.—The distribution or “run-off” of the available water supply is almost as important a factor, and often more important, in the economy of the water than the quantity of available supply itself, and the manner in which this takes place influences considerably the ultimate availability of the supply for human use. There are two methods of distribution or run-off; namely, the superficial or surface run-off and the underground run-off, resulting in springs which eventually change into open runs, brooks, and rivers.

The water capacity of soils and soil-covers has been referred to as an element of interception. With reference to the run-off, this capacity becomes influential in determining the manner of run-off. As soon as the soil-cover and upper soil strata are saturated, and especially when the latter are impermeable and the rain continues, either no water or only a small part gradually can find entrance into the soil, and the run-off becomes superficial, or, if the ground be not sloping, stagnant water results. For every forest there is, therefore, a time when the superficial run-off would be no more impeded than from an open field of similar conditions but for the retardation by the trunks, underbrush, and roots. This time, however, occurs later in the forest than on the unforested and especially naked soil, because the water capacity of the soil-cover as well as of the protected soil, is greater than that of the naked soil or that covered with field-crops.

Since the forest-cover has a tendency to preserve the granular porous structure of the soil, which is favorable to filtration, and as, moreover, the roots furnish channels for unimpeded drainage, it must have the tendency, other things being equal, to allow a more rapid filtration than the naked, mostly compacted soil. The temperature appears to have an influence favorable to rapid filtration in the forest; for, according to Pfaff, in the field during winter three-quarters of the precipitation will sink to two feet depth in the soil, and not more than ten to thirty per cent. in summer.

With regard to the superficial run-off, without any evidence furnished by experiments, we can at once understand that it is impeded by any kind of mechanical obstruction, such as is offered by the vegetation of a meadow or forest. The great number of inequalities which the forest floor offers, in addition to the trunks and stumps and fallen trees, subjects the run-off to many detours, thus retarding its flow and its collection in the open runs and brooks. This retardation is increased by the mechanical obstruction which the crowns of the trees exert upon the rainfall. Every leaf, every twig breaks the force and retards the fall of the raindrops, allowing those fallen before to penetrate the soil. The devious ways in which it reaches the soil make the flow of water from a forest-covered hill longer in time than if the rain had fallen on a bare slope. This mechanical effect is further favorable to the penetration of water into the soil, as it prevents the rain from compacting the soil; preserving thereby its mellow condition, which is destroyed on the open field by the force of the raindrops. It also allows more time for the absorption of water by the soil. There is, in fact, no influence of the forest of more moment in the distribution of the available water supplies than the mechanical retardation of the “run-off,” while in the conservation of supplies the retarding influence upon evaporation is the potent one.

FOREY, ELIE FRÉDÉRIC, a French marshal, born at Paris, Jan. 10, 1804, died there June 20, 1872. He was educated at Dijon, graduated at the military school of St.-Cyr in 1822, and was engaged in the Algerine campaigns of 1830, 1835, and 1840, returning to France a colonel. He took an active part in the *coup d'état* of December, 1851, and was made general of division and commander of the Legion of Honor in 1852. In the war with Russia he was for a short time in command of the French forces before Sebastopol, and during the Italian war in 1859 defeated the Austrians at the battle of Montebello. Gen. Forey commanded the French expedition against Mexico, captured the city of Puebla, May 17, 1863, and entered the capital June 10. For these successes he was made a marshal. On his return to France he had command of an army corps and of the camp of Chalons.

FORFEITURE, a term in law which includes the various cases in which a person is penally deprived of property.

FORIO, or FORIA, a town of Italy, on the west coast of the island of Ischia, 16 miles southwest of Pozzuoli. Population, 6,407.

FORISFAMILIATION, the separation of a child from the family of his father. A child is said to be forisfamiliarized either when he marries or when he receives from his father a separate stock, the profits of which are enjoyed by himself, though he may still reside with his father. The same result is also brought about when a child renounces his legal share of the father's free movable property due to him on the death of the latter.

FORKED-BEARD, a gadoid fish (*Phycis blennioides*), found on the European coasts; so called from its barbules. The corresponding species of the United States, *P. chuss*, *P. tenuis*, and *P. regius*, are known as *hake* and as *codlings*.

FORLORN HOPE, a body of men selected to attempt a breach, or to lead in scaling the wall of a fortress. The name is given on account of the extreme danger to which the leaders of a storming party are necessarily exposed. As, however, the honor of success is proportionate to the peril of the undertaking, there is ordinarily no lack of volunteers for this arduous service. The for-

lorn hope is called by the Germans *Die verlorenen Posten*.

FORMA PAUPERIS, the phrase usually employed to signify the arrangement by which an action may be carried on by one who is too poor to sue in the ordinary way.

FORMATION: in geology, a term applied to a group of strata united by some character which they have in common, whether of age, origin or composition, as the coal or chalk formation.

FORMES, CHARLES JOHN (1810-90), a German singer. He appeared in various operas in Vienna, Hamburg and London, and gained a reputation as a bass singer of unequaled talent. In 1857 he came to the United States, and appeared with much success in the principal cities of the Union. After a time, his voice becoming impaired by frequent hoarseness, he retired from the operatic stage.

FORMIC ACID (CH_3O) derives its name from the circumstance of its having been first obtained from the *Formica rufa*, or red ant. In a concentrated state, it is a fuming liquor with an irritating odor, and occasions vesication if dropped upon the skin. It crystallizes at a temperature below 32° , and boils at about 212° , yielding a vapor which burns with a blue flame. It is a strong reducing agent, at a boiling temperature reducing the salts of silver, mercury, platinum and gold.

FORMING'S ISLAND is a speck on the bosom of the Pacific, lying a little to the north of the Sandwich Group, or Hawaiian Archipelago, in latitude $30^\circ 49' \text{ N.}$, and longitude $159^\circ 20' \text{ W.}$ It is one of the dependencies of the British Empire, having been formally occupied, mainly on account of its excellent harbor, toward the close of 1860.

FORMOSA (Chinese name *Tai-wan*), a large island on the southeast coast of China, opposite the Province of Fo-kien, from which it is distant about ninety miles. It lies between $21^\circ 53'$ — $25^\circ 16' \text{ N.}$ latitude, and $120^\circ 15'$ — $122^\circ 4' \text{ E.}$ longitude. Length, about 237 miles; average breadth, about 70 miles.

FORMOSA, a territory in the extreme north of Argentine Republic, formed in 1884, and bounded on three sides by the rivers Pilcomayo, Paraguay, and Bermejo. Estimated area, 44,490 sq. miles. Little is known, even by Argentinians, of the newly-formed territory, which is, however, described generally as a vast plain, gently sinking to the southeast, covered with forests, and in large sections liable to frequent inundations. The summer rains last from October to May. The capital is Formosa (1000 inhabitants), on the Paraguay, about 100 miles north-northeast of Corrientes.

FORNEY, JOHN WEISS (1817-81), an American journalist. In 1840 he published the *Lancaster, Pa., "Intelligencer and Journal,"* a Democrat paper, and in 1845 became surveyor of the port of Philadelphia. From 1851 to 1855 he was clerk of the House of Representatives, and in 1856 was elected chairman of the Pennsylvania Democratic State Committee. In 1859 he was again chosen clerk of the House of Representatives, and in 1861 became secretary of the U. S. Senate. In 1871-72 he became collector of the port of Philadelphia. He edited for a time the Philadelphia "Pennsylvania"; became editor of the Washington "Union" in 1851; of the Philadelphia "Press" in 1857; of the Washington "Chronicle" in 1859; and in 1879 of "The Progress" in Philadelphia.

FORNICATION (*fornicatio*) from *fornix*, an arch-vault, and by metonymy, a brothel, because brothels at Rome were in cellars and vaults underground. In most countries this crime has been brought

within the pale of positive law at some period of their history, and prohibited by the imposition of penalties more or less severe. In England, in 1650, the repeated act of keeping a brothel or committing fornication was made felony without benefit of clergy on a second conviction. Similar laws, of a most stringent character, were adopted by the Puritan founders of New England.

FORREST CITY, a town and the county-seat of St. Francis county, Ark. Population, 903.

FORRES, a royal burgh of Elginshire, 5 miles south of Findhorn village, on the Moray Firth, and 25 east-northeast of Inverness, with which and Nairn and Fortrose it returns a member to Parliament. On its Castle Hill, a royal residence from 1189 to 1371, stands an obelisk (1857), 65 feet high, to the Crimean hero, Dr. Thomson, of Cromarty; whilst on the wooded Cluny Hill are a hydropathic establishment, and the Nelson tower (1806), 70 feet high. Sueno's Stone is a remarkable sculptured monolith, ascribed by Skene to the year 900; the Witch's Stone recalls Macbeth's meeting with the weird sisters near Forres. Public buildings are the town-house, Falconer Museum, Mechanics' Institute, and Anderson's Institution. Population (1851), 3,468; (1881), 4,030.

FORREST, ALEXANDER, an Australian explorer, was born at Bunbury, Sept. 22, 1849. After taking part with his brother John in his journeys, he in 1879 started, along with Hill, to explore the north-western parts of the Australian continent, an expedition which resulted in the discovery of the fertile pastoral region now called Kimberley District. Besides being well watered, it was also seen to be suitable for the cultivation of such tropical harvests as sugar, coffee and rice. At the same time the river Fitzroy was ascended for a distance of about 250 miles. This journey was described in *Journal of an Expedition from the De Grey to Port Darwin* (1880).

FORREST, EDWIN, born in Philadelphia, March 9, 1806; died there Dec. 12, 1872. He made his theatrical debut as "Douglas" in Home's tragedy of that name, and traveled and performed in the theaters of the West and Southwest without attracting much notice. In November, 1826, he played a star engagement at the New York Bowery Theater, where he opened in the character of "Othello," which was pronounced a signal success. This was followed by other parts acted with no less ability. He left New York a prominent tragedian and a great favorite, to repeat his dramatic triumph in other cities of the Union. After playing for several years he visited Europe for recreation and study. He returned to the United States in 1831, and continued playing with unabated attraction until the autumn of 1836, when he sailed for Europe. His first appearance in England was as "Spartacus" in the *Gladiator*, which was followed by "Macbeth," "Lear" and "Othello." In London he married a daughter of John Sinclair, the popular Scottish vocalist, and in November of the same year began an engagement in Philadelphia. In 1845, in company with his wife, he again visited London and performed at the Princess's Theater. Much professional jealousy arose between Forrest and Macready, the favorite tragedian of the British stage, which led to open outbreaks of temper, in consequence of which the American actor lost the favor of the British public. In May, 1849, when Macready was playing in this country as "Macbeth" at the Astor Place opera house, a riot ensued. On this occasion twenty rioters were killed and thirty-six wounded. The actor's marriage with his British wife proved an unhappy one; divorce suits were brought on both sides, that occupied the courts for several

years, and were finally decided in the wife's favor. In 1853 Forrest performed at the Broadway theater for several weeks. In 1865 he became gouty, and one of his arms was slightly paralyzed. Forrest's trip to California in 1866 was unsuccessful. His last theatrical appearance was made at Boston in March, 1871, when he broke down during the engagement. Later, he endeavored to give readings from Shakespeare's plays, but they failed to attract.

FORREST, FRENCH, born in Maryland, in 1796, entered the United States navy at the age of 15 and took part as a midshipman in the battle of Lake Erie. He became captain in 1844, served in Mexico with credit, and in 1861 joined the Confederacy and was given a naval command. Afterward he became Assistant Secretary of the Confederate navy. He died in 1866.

FORREST, JOHN, C.M.G., F.R.G.S., F.G.S., F.L.S., Honorary Fellow of the Royal Geographical Societies of Italy, Vienna and St. Petersburg, Knight of the Italian Crown, entered the Survey Department of Western Australia, 1865, and in 1869 commanded an exploring expedition into the interior in search of Dr. Leichhart and party. In 1870 he commanded an exploring expedition from Perth to Adelaide along the South Coast, and proved the practicability of the country for a telegraph line, which was erected in 1876. In 1874 he commanded an exploring expedition from Champion Bay on the West Coast of Australia to the overland telegraph line between Adelaide and Port Darwin without the aid of camels, with horses only, a journey of nearly 2,000 miles. For these services he received the thanks of the Governor and the Legislative Council, and was awarded the gold medal of the Royal Geographical Society of London, May 22, 1876, and was also presented by the Imperial Government with a grant in fee of 5,000 acres of land. In 1876 he was appointed Deputy Surveyor-General of Western Australia. In 1878 and 1882 he conducted the Trigonometrical Surveys of the Nickol Bay District and the Gascoyne and Lyons District in Northwestern Australia. From September, 1878, to January, 1879, he acted as Commissioner of Crown Lands and Surveyor-General, with a seat in the Executive Council of the Colony. In 1880-81 he acted as Comptroller of the Imperial Establishments and Expenditure in Western Australia. He is a justice of the peace for the Colony. In 1882 he was made a Companion of the order of St. Michael and St. George. In 1883 he was appointed Commissioner of Crown Lands and Surveyor-General, and in the same year, and again in 1886, proceeded to Kimberley District, Northwest Australia, to report on it to the Government. He is a member of the Executive and Legislative Councils of the Colony; represented Western Australia at the Colonial Conference in London, 1887. He has published "Explorations in Australia," 1876; "Notes on Western Australia," 1883, 1884 and 1885.

FORREST, NATHAN BEDFORD, born in Tennessee, July 13, 1821; died Oct. 29, 1877. He became a planter and afterward a slave-dealer, and in June, 1861, raised a cavalry regiment for the Confederacy and was engaged at Fort Donelson, Shiloh, Murfreesboro and Chickamauga. Becoming a major-general, he commanded at the attack on Fort Pillow in April, 1864. The works were taken by assault and the colored troops of the garrison were mercilessly slaughtered, no quarter being given. Forrest was promoted lieutenant-general. Gen. J. H. Wilson defeated him in April, 1865, and he surrendered at Gainesville a month later. After the war he engaged in the railroad business.

FORREST, URIAH, born in Maryland in 1756, served in the Continental army and was wounded

at Germantown and the battle of the Brandywine. Subsequently he served in Congress and in the legislature of his native State. He died in 1805.

FORSHEY, CALEB G., born in Pennsylvania in 1812, studied at West Point and became an engineer. He had charge of U. S. surveys in Mississippi and Texas and was actively engaged in railroad construction for many years. During the civil war he served on the staff of General Magruder as chief engineer. After the close of hostilities he reengaged in railway work and contributed extensively to technical journals. He died in 1881.

FÖRSTER, ERNST JOACHIM, a German painter, and art-writer, born in Münchengossmstadt, Bavaria, April 8, 1800, died May 10, 1885. He studied theology and philosophy in the universities of Berlin and Jena, but in 1822 abandoned these to devote himself to painting under the instruction of Cornelius. He executed various fresco pieces in Bonn and Munich. In 1826 he visited Italy, and commenced researches in art-history, which he subsequently pursued in Germany, France, Belgium, and England. The results of his studies are embodied in the publications, *Letters on Painting* (1838); *History of German Art* (5 vols. 1851-60); *Monuments of German Architecture, Sculpture, and Painting* (12 vols. 1853-69); biographies of Fra Angelico, J. G. Müller, Raphael, and Cornelius. At the time of his death he left two large works unfinished, *A History of Italian Art and Monuments of Italian Painting*. In his researches in Italy he discovered several ancient pictures, notably frescoes of Avanzo in Padua, which he restored.

FÖRSTER, HEINRICH, a German prelate, born at Grossglogan, Silesia, Nov. 24, 1800, died Oct. 20, 1881. He was educated at the University of Breslau, was ordained priest in 1825, and was for a time chaplain at Liegnitz and afterwards pastor at Landshut. In 1837 he was attached to the cathedral at Breslau, and in 1853 was chosen to succeed Diepenbrock, prince-bishop of Breslau. He was strongly opposed to the doctrine of papal infallibility, but submitted when it was declared. It was largely due to Förster's efforts that the Prussian government was unsuccessful in its attempt to control ecclesiastical affairs, and for this reason he was suspended from his office in 1875. Among his published works are: *Homilien auf die Sonntage des Katholischen Kirchenjahres* (1851); *Der Ruf der Kirche in die Gegenwart* (1852); *Die Christliche Familie* (1854); and *Kanzelvorträge*.

FORSTER, JOHANN REINHOLD, a German traveler and naturalist, born at Dirschau, in Prussia, in 1729, died at Halle in 1798. In 1753, having studied for the clerical profession, he became pastor at Nassenhuben, near Dantzic. See FORSTER, JOHANN GEORG ADAM, in *Britannica*, Vol. IX, p. 418.

FORSTER, THOMAS IGNATIUS MARIA (1789-1850), an English meteorologist and physicist. In 1812 he entered the University of Cambridge, and in 1816 he edited an edition of Catullus. In 1817 he published *Observations on the Influence of Particular States of the Atmosphere on Human Health and Diseases*; in 1824, *The Perennial Calendar*, and in 1827 *The Pocket Encyclopedia of Natural Phenomena*.

FÖRSTER, WILHELM, a German astronomer, born at Grunberg, in Silesia, Dec. 16, 1832, and educated at Berlin and at Bonn. He was successively second and first assistant in the Berlin Observatory, in 1863 became professor extraordinary of astronomy in the University, and in 1865 succeeded Encke as director. He has published popular sketches of the history of astronomy and the lives of distinguished astronomers, and has edited the "Astronomisches Jahrbuch" since 1865.

FORSTER, WILLIAM, English philanthropist, born at Tottenham, near London, March 23, 1784, died Jan. 27, 1854. He was of Quaker descent, became a minister of the Society of Friends in 1803, and married Anna, sister of Thomas Fowell Buxton, in 1816. In 1820 he visited the United States; in 1838 settled as a preacher near Norwich, England; in 1843-44 engaged in missionary work in France; and in 1846 visited Ireland, endeavoring to relieve the suffering there caused by famine. In 1849 he was commissioned by the Yearly Meeting of London to present an address on slavery and the slave-trade to the rulers of Christian countries. In pursuit of this mission he visited most of the countries on the Continent of Europe, and in 1853 came again to the United States, and had interviews with the President and several Southern State governors. Before the completion of his work he died at Holston, Tenn.

FORSTER, WILLIAM EDWARD, an English statesman, son of William (1784-1854), was born at Bradpole, Dorsetshire, July 11, 1818, died April 6, 1886. He was educated at the Friends' School, Tottenham, and engaged in woolen manufacture at Bradford. In 1861 he was returned to the House of Commons for Bradford, and was a member of Parliament from that time until his death. He was under-secretary for the colonies 1865-66; became vice-president of the council on education, and a privy councillor in 1868; accepted from Mr. Gladstone a seat in the cabinet in 1870, and the same year introduced the greatest legislative measure associated with his name, the Elementary Education bill. In the Gladstone administration of 1880 he accepted the office of chief secretary for Ireland, which position he resigned in 1882. He visited the United States in 1874.

FORSYTH, a city and county-seat of Monroe county, Ga. It has a large cotton trade and contains Monroe Female College.

FORSYTHIA (named after William Forsyth (1737-1804), a British botanist), a genus of oleaceous shrubs, of which the two species, *F. viridissima* and *F. suspensa*, natives of China and Japan, are now very common in cultivation. They are conspicuous for the showy yellow flowers which they bear in early spring, before the leaves.

FORSYTH, JOHN (1780-1841), an American statesman. He was admitted to the Georgia bar in 1802, and became attorney-general in 1808. From 1813 to 1818 he served as a Democrat in Congress, and from 1818 to 1819 was a United States Senator, resigning to accept the appointment of minister to Spain. From 1823 to 1827 he was again in Congress, then became governor of Georgia, and in 1829 was once more elected United States Senator. He resigned in 1834 to become Secretary of State, and served till 1841.

FORSYTH, JOHN (1813-79), an American journalist, son of the preceding, was one of the foremost Democratic editors of the South. From 1856 to 1858 he was minister to Mexico, and in 1861, with Marshall J. Crawford, represented the Confederate States as commissioner to the National Government. After the civil war he was engaged in journalistic work in Mobile, Ala., until feeble health compelled him to retire.

FORT ADAMS, a fortification constructed between 1828 and 1838 by Gen. J. G. Totten, on Breton's Point, at the entrance to Newport harbor, R. I.

FORT-ADJUTANT, an officer holding, in a fortress, an appointment analogous to that of an adjutant in a regiment. He is responsible to the commandant for the internal discipline and the appropriation of the necessary duties to particular corps.

FORT AUGUSTUS, a village at the south end of Loch Ness, 29 miles southwest of Inverness. A fort intended to overawe the highlands was built here soon after the rebellion of 1715, on a small eminence on the loch.

FORT ATKINSON, a city of Jefferson county, Wis., on Rock River, near Lake Koshkonong. It has manufactories of wagons, and contains foundries and flouring mills. Pop. (1890), 4,482.

FORT BENTON, the county-seat of Choteau county, Mont., at the head of navigation on the Missouri River. Population (1890), 624.

FORT COLLINS, the county-seat of Larimer county, Col., on the Cache la Poudre River, 60 miles northwest of Denver. The town has good water-power, some manufactories, and contains Colorado Agricultural College. Pop. (1890), 2,011.

FORT HAMILTON, a village and fort on the east shore of the Narrows, New York harbor, in New Utrecht, Kings county, L. I. Pop. (1890), 2,617.

FORT DODGE, a city and county-seat of Webster county, Iowa, on the Des Moines River. It has quarries where gypsum, fire-clay and water-lime are obtained, and coal is mined in the vicinity. It contains various manufactories, and a Roman Catholic seminary. Population (1890), 4,871.

FORT DONELSON, a fortification in Stewart county, Tenn., on the left bank of the Cumberland River, 12 miles from Fort Henry. It was the field of action where the Union forces gained an important victory under Gen. Grant, Feb. 16, 1862.

FORTE: in music, the Italian term for loud; *fortissimo*, or *forte possibile*, as loud as possible.

FORT EDWARD, a railroad junction of Washington county, N. Y., on the Hudson River and Champlain Canal, 28 miles north of Troy. A dam 900 feet long crosses the River, affording excellent water-power. The village has a collegiate institution and extensive manufactories of iron, lumber, castings, stoneware and machinery. The ruins of an old fortification give the name to the village.

FORT FISHER, a fortification of Wilmington, N. C. During the civil war two assaults were made upon it—Dec. 24, 25, 1864, and Jan. 13-15, 1865. The fort fell into Union hands at the conclusion of the second assault.

FORT GEORGE, a fortification in the northeast of Inverness-shire, Scotland, on the line of the Caledonian Canal, on a point of land jutting into Moray Firth. It covers 15 acres, and has quarters for 3,000 men.

FORT GRATIOT, a village and military post of St. Clair, Mich., on the outlet of Lake Huron, and opposite Point Edward, Ontario.

FORTHCOMING: in the law of Scotland, an action by which an arrestment is made available to the arrester. The arrestment secures the goods or debt in the hands of the creditor or holder; by the forthcoming—the arrestee and common debtor are called before the judge to hear sentence given, ordering the debt to be paid, or the effects to be delivered up to the arresting creditor.

FORT HOWARD, a city of Brown county, Wis., near the mouth of the Fox River and opposite the city of Green Bay. It has an excellent harbor and a population (1890) of 4,754.

FORTIGUERRA, NICOLÒ, an Italian poet, born at Pistoja in 1674, died in 1735. Destined from youth for the church, he proceeded to Rome at an early period, where the power of the prelate Carlo Fabroni speedily secured him advancement, and he was raised to the dignity of prelate and papal chamberlain by Clement XI. His chief work, *Il Ricciardetto*, published two years after his death, was originally commenced, and one canto completed in a few hours, in confutation of friends who

maintained that the striking ease and fluency of Ariosto, Berni, and other poets were but apparent, and in reality the fruit of deep art and severe labor.

FORT KENT, a town of Aroostook county, Me. It has good water-power and manufactories of lumber. Population, 1,829.

FORT LEAVENWORTH, a village of Leavenworth county, Kan., on the Missouri River, and an important U. S. military post and depot of supplies for Western forts. This fort was established in 1827.

FORT MADISON, a city and county-seat of Lee county, Iowa, on the Mississippi River, opposite Niota, Ill. It has a State penitentiary, jail, schools, and manufactories of sashes, blinds, doors, machinery, castings, beer, furniture, plows, lumber and leather. Population (1890), 7,901.

FORT PLAIN, a village of Montgomery county, N. Y., on the Mohawk River and Erie Canal. It has manufactories of brooms, springs and axles, and contains a seminary. Population, 2,864.

FORT ROYAL, or **FORT DE FRANCE**, a fortified seaport of the French island of Martinique in the West Indies, and the capital of the colony. It stands on the west coast, in a bay of its own name, in latitude $14^{\circ} 35'$ north, and longitude $61^{\circ} 4'$ west. In 1839 it was almost totally destroyed by an earthquake. Population, 13,288.

FORT ST. DAVID, a town in India, on the Coromandel or east coast of Hindoostan. It is three miles to the north of Cuddalore, and 100 to the south of Madras.

FORT SCOTT, a city of Kansas, county-seat of Bourbon county, and one of the most important places in the southeastern part of the State. The city is built on a high plateau 800 feet above the level of the sea, on the south bank of the Marmaton River, near the Missouri border. It is in the midst of a region rich in bituminous coal, the mining and shipping of which give Fort Scott its chief commercial importance. There are also extensive flagstone quarries and cement rock deposits in the vicinity. Ten lines of railway furnish an outlet for the mineral products. In 1890 there were ten miles of street railway, operated by electricity. The city contains a large and handsome park, in the center of which is an artesian well. The United States Court-house and Postoffice building cost \$150,000. There is a high school and a normal college, the latter having in 1890 over 700 students, representing 12 different States. The principal manufactures are flour, woolen goods, soap, sorghum and beet sugar, carriages, etc. Population, in 1880, 6,750; in 1890, 11,837.

FORT SUMTER, the fortification at Charleston, S. C., first attacked by Confederate forces at the outbreak of the civil war, April 12, 1861. Maj. Anderson, commanding, was obliged to surrender, and the fort was held by the Southern army till Feb. 18, 1865. It is built on an artificial island, and the construction was begun in 1829.

FORT SMITH, a city of Arkansas, county-seat of Sebastian county, situated at the extreme western boundary of the State, on the south bank of the Arkansas River, about 170 miles from Little Rock. It is an important city, having a large trade in the Indian Territory. It is also the seat of the United States District Court for the western district of Arkansas, having criminal jurisdiction of the Indian Territory. In 1889 the county erected a court-house costing \$65,000. Other public buildings are the United States Custom-house, court-house, post office and jail. By an act of Congress a military reservation adjacent to the city limits was donated to the city for school purposes.

This gift is valued at \$750,000, nearly one-half of which has already been realized by the sale of lots.

The principal manufactories are saw mills, planing mills, iron foundries, machine shops, oil mills, etc. The machine shops of the St. Louis and San Francisco Railway company are located here. Population in 1880, 3,099; in 1891, 11,291.

FORTUNE, ROBERT, a Scottish botanist, born in Berwickshire, Sept. 16, 1813, died April 16, 1880. After serving an apprenticeship as a gardener he obtained employment in the Royal Botanic Garden at Edinburgh, and afterwards, in the gardens at Chiswick. In 1842 he was sent by the Horticultural Society of London to collect plants in Northern China. After his return he published *Three Years' Wanderings in Northern China* (1847). He subsequently visited China on three separate occasions, to study the methods of tea cultivation, to carry plants from that country to India, and to collect seeds and plants for the Government of the United States. *Yeddo and Peking* (1863) was written after his fifth and last journey to the East. His other books are: *A Journey to the Tea Countries of China* (1852); and *A Residence Among the Chinese* (1857). Fortune was for a few years director of the Botanical Gardens at Chelsea.

FORTUNY, MARIANO, Spanish painter, born at Reus, Catalonia, June 11, 1839, died in Rome Nov. 21, 1874. He studied in the Academy of Barcelona, and by the excellence of some early designs won a prize which enabled him to go to Rome in 1858. When Spain declared war against Morocco, Fortuny accompanied the expedition to Africa, and filled his portfolios with studies of Eastern life. On his return to Europe he renounced classical traditions, and, giving full scope to his originality and genius, put on canvas the essence of the materials he had gathered. With name and fame already established he went from Rome to Paris in 1866, and there his works were introduced to the whole art-loving world. In 1868 Fortuny went to Madrid and there married Mademoiselle Madrazo, a daughter of the director of the Royal Museum. In 1870 he took up his residence in Granada, and in 1872 returned to Rome, where he resided until his death. His best-known pictures are: *A Spanish Marriage*; *The Serpent Charmer*; *The Amateur of Prints*; *A Fantasia at Morocco*; *The Sword-Sharpener*; *The Academicians of Arcadia*. Besides his oil-painting he gave considerable attention to etching and to water-colors.

FORT WILLIAM, a village and fort of Scotland, in the county of Inverness, on Loch Eil, near the foot of Ben Nevis, adjacent to the village of Maryburgh. Population, 1,212.

FORT WAYNE, a city of Indiana, county-seat of Allen county (see Britannica, Vol. IX, p. 469). Fort Wayne is the third city in the State in population, and the second in manufacturing importance. An abundant supply of pure water is obtained from 30 wells, each 8 inches in diameter and 55 feet deep, the outflow being 30,000,000 gallons daily. In 1891 there were 13 public school buildings; also a grammar school, with a library of 7,000 volumes, an extensive laboratory, and elaborate scientific apparatus. The Roman Catholics have a large and flourishing academy. The State Asylum and School for feeble-minded youth is located at Fort Wayne, and has accommodations for 1,000 pupils. Eight railroad lines meeting here give the city unusual commercial advantages. Its leading manufactures are car-wheels, electrical apparatus, heavy machinery of all kinds, agricultural implements, leather, steam engines, furniture, etc. Population in 1880, 26,880; in 1890, 35,349.

FORT WORTH, a city of Texas, county-seat of Tarrant county, situated at the confluence of the West, Clear, and Trinity Rivers in the northern part of the State, about 175 miles north of Austin. Next to Dallas, it is the most important railroad center in northern Texas. It is surrounded by a rich agricultural region, producing cotton, grain, and fruits. The city has good water supply obtained from two sources, the Clear River and artesian wells, some 200 in number. In 1890 there were in operation 40 miles of electric street railways. A fine bathing establishment, the Natatorium, costing \$50,000, is one of the institutions of the city. The court-house and city hall are noteworthy structures, also the Chamber of Commerce building, which cost \$100,000. The High School building, completed in 1891, is a handsome and costly edifice. The Fort Worth University (Methodist) is located here, and the Roman Catholics maintain an academy. There are manufactories of flour, cotton and woolen goods, leather, etc., and rolling-mills, iron foundries, a jute factory, woven wire factory, stock yards, and pork-packing establishments. In 1872 there was but one house standing within the present city limits; in 1876 the population was 1,123; in 1880, 7,000; and in 1890, 20,725.

FORWARD, WALTER (1786-1852), an American statesman. For a time he was editor of the Pittsburgh "Tree of Liberty," a Democratic newspaper, but later studied law and was admitted to the bar in 1806. From 1822 to 1825 he served in Congress. In 1841 he was appointed first comptroller of the treasury, and the same year received the appointment to the treasury portfolio. From 1843 to 1849 he was engaged in his law practice, and 1849-51 was *chargé d'affaires* in Denmark. In 1851 he became president judge of the district court of Alleghany county, Pa.

FOSSA ET FURCA, or PIT AND GALLS, an ancient privilege granted by the crown to barons and others, which implied the right of drowning female felons in a ditch, and hanging male felons on a gallows.

FOSS, CYRUS DAVID, an American M. E. bishop, born in 1834. He graduated at Wesleyan University, Middletown, Conn., in 1854; for three years was an instructor in Amenia Seminary, N. Y., and in 1857 entered the traveling ministry in the New York conference. In 1857-59 he was stationed at Chester, N. Y.; in 1859-65 was in Brooklyn, and in 1865-75 in several churches in New York city. In 1875 he was chosen president of Wesleyan University, and served in that capacity until 1880, when he was elected and ordained a bishop. Wesleyan gave him the degree of D. D. in 1870, and Cornell College, Iowa, that of LL. D. in 1879. He was a member of the general conference in 1872, 1876 and 1880. Bishop Foss has contributed to current literature, and published several sermons and addresses.

FOSSA MARIANA, a system of canals, from the Rhone to near the Gulf of Stomalinne, cut by Marius, B. C. 102.

FOSSILIFEROUS ROCKS, those which contain organic remains. If we except the lowest metamorphic rocks, in which no fossils have been found, the term is equivalent to the "stratified rocks" when used comprehensively; but it may also be applied to a particular bed, as when we speak of an unfossiliferous sandstone compared with the fossiliferous shale or limestone.

FOSTER, BIRKET, an English artist, born at North Shields, Feb. 4, 1825. At an early age he showed remarkable talent for drawing, and as pupil to Landells, wood-engraver, from 1841 to

1846, he produced a large number of subjects for wood-engraving, the earliest for Mr. and Mrs. S. C. Hall's *Ireland* (1843), and many for the "Illustrated London News." He afterwards illustrated *Evangeline*, and many of the standard English poets. In 1859 Foster exhibited the first of many water-colors, *The Mill at Arundel*; in 1860 he was elected an associate, and in 1861 a member of the Water-color Society. He has devoted himself chiefly to depicting child-life and rural scenes.

FOSTER, CHARLES, a governor of Ohio, born in 1828. In 1870 he was chosen to Congress as a Republican, and was three times reelected. He was twice chosen governor of Ohio, and served from 1880 to 1884. Under the Harrison administration he served as Secretary of the Treasury.

FOSTER, JOHN GRAY (1823-74), an American soldier. He served in the Mexican war, and received the brevets of first-lieutenant and captain for gallantry. For a time he was employed on coast survey, and in 1855-57 was assistant professor of engineering at West Point. At the beginning of the civil war he safely removed the garrison of Fort Moultrie to Fort Sumter, and was brevetted major for these services. In October, 1861, he was made brigadier-general of volunteers, and the same year was brevetted lieutenant-colonel. In 1865 he was brevetted major-general for gallant services in the field during the Rebellion. After the war he served as superintending engineer of various river and harbor improvements. He contributed to periodical literature on engineering topics, and is the author of *Submarine Blasting in Boston Harbor*.

FOSTER, JOHN WATSON, an American diplomatist, born in 1836. In 1857 he began the practice of law in Evansville, Ind. At the beginning of the war he entered the national service as a major, and distinguished himself in many battles under Grant and Sherman. In 1869 he was appointed postmaster of Evansville, and in 1873 was sent to Mexico as United States minister, receiving a re-appointment in 1880. Later the same year he was transferred to Russia, and in 1881 resigned to attend to private business. From 1883 to 1885 he served as minister to Spain. In July, 1892, he was appointed Secretary of State, to succeed Mr. Blaine.

FOSTER, JOHN WELLS (1815-73), an American geologist. In 1835 he was admitted to the Ohio bar, but his leisure moments were spent in the study of science. From 1835 to 1844 he was employed as an assistant in the geological survey of Ohio, and in 1845 visited the Lake Superior region in the interest of several copper mining companies. In 1847 he was appointed on a geological survey of the Lake Superior region, and the results of his survey, published by Congress in 1852, still remain the authority. For a time after the completion of this work he lived in Massachusetts, where he was active in the formation of the Republican party. In 1858 he went to Chicago, and for a time was land commissioner for the Illinois Central Railroad. Mr. Foster was a member of several scientific societies, and held important offices in not a few.

FOSTER, LAFAYETTE SABINE (1806-80), an American statesman. He was admitted to the Connecticut bar in 1831; for a time edited the Norwich "Republican," and in 1839 and 1840 was elected to the legislature. In 1846-48 he was again in the legislature, and in 1851-52 was mayor of Norwich. In 1854 he again went to the assembly, and the same year was chosen to the United States Senate, and was reelected in 1860. In 1865 he was made president of the Senate *pro tempore*, and for a while, was acting Vice-President of the United States. In 1870 he once more served in the assembly, but re-

signed the same year to take his seat on the bench of the Supreme Court. He retired in 1876.

FOSTER, RANDOLPH SINKS, an American M. E. bishop, born in 1820. He received his education at Augusta College, Ky., and in 1837 entered the itinerant ministry of the M. E. church in the Kentucky conference. Later he was transferred to Ohio, and in 1860 to New York. Up to 1857 he had held pastorates in Hillsboro, Portsmouth, Lancaster, Springfield, Cincinnati, New York and Brooklyn. In 1856-58 he was president of the Northwestern University, Evanston, Ill. For some time afterward he was pastor in New York and Sing Sing, and in 1868 was delegate to the British Wesleyan conference. The same year he became professor of systematic theology in Drew Theological Seminary, Madison, N. J., and two years later was appointed president. In 1872 he became bishop of the M. E. church, and afterward made episcopal visitations in Norway, Sweden, Denmark, Germany, Switzerland, Italy, India and South America. He is the author of *Objections to Calvinism as It Is; Christian Purity; Ministry for the Times; Beyond the Grave; Centenary Thoughts for the Pulpit and Pew of Methodism; and Studies in Theology*.

FOSTORIA, a natural-gas center of Seneca county, Ohio, containing glass works, flouring-mills and other manufactories. The city has developed rapidly and had, in 1890, a population of 7,070.

FOULARD, a light fabric of flexible silk, without twill, used principally for ladies' dresses. It was originally imported from India, but is now made also in the south of France.

FOUNTAIN. In heraldry water is represented by a round ball having wavy stripes of blue and white barways, and called a fountain.

FOUQUIERA, a genus of Mexican trees or shrubs of the order *Tamariscinæ*, resinous and brittle, having leafless branches and stems, and bearing brilliant crimson flowers.

FOURCROYA, a genus of plants of the natural order *Amaryllidæ*, nearly allied to *Agave*, but with stamens shorter than the corolla. The species are all tropical. The leaves yield a fiber similar to the pita flax, obtained from the species of the *Agave*.

FOUR EVANGELISTS, part of a larger group of islands known as the *Twelve Apostles*, which lie off the west entrance of the Strait of Magellan. The eight other islands, with which they are classed as above, are about 15 miles farther out into the Pacific.

FOUR LAKES, a chain of deep lakes (Mendota, Monona, Waubesa, and Kegonsa) in Dane county, Wisconsin, connected by short outlets.

FOURNI ISLANDS, a group of about 20 small islands in the Grecian Archipelago, between Nicara and Samos on the western coast of Asiatic Turkey. The largest of these is about five miles in circuit.

FOURTH: in music, an interval including four degrees of the scale. The interval of the perfect fourth contains two whole tones and one semi-tone; a diminished fourth, one whole tone and two semi-tones; and the superfluous or augmented fourth, three whole tones. The perfect fourth is the second most perfect consonance after the octave, and the next to the fifth.

FOWEY, or Foy, a town of England, in the county of Cornwall, 25 miles southwest of Launceston. The principal exports are copper ore, pilchards, china clay, and stone. Population, 1,394.

FOWL. See *Britannica*, Vol. IX, p. 491.

FOWLER, CHARLES HENRY, an American M. E. bishop, born in 1837. He graduated at Genesee College, Lima, N. Y., in 1859, and in 1861 at Garrett Biblical Institute, Evanston, Ill. The same year

he was admitted into the Rock River conference, and was appointed to churches in Chicago till 1872, when he was chosen president of Northwestern University. In 1876 he was elected editor of the New York "Christian Advocate," and in 1880 became one of the corresponding secretaries of the Missionary Society of the M. E. church. In 1884 he was elected and ordained bishop. Northwestern University gave him the degree of D.D., and Syracuse University, N. Y., that of LL. D.

FOWLER, SIR JOHN, civil engineer, born at Sheffield in 1817, assisted in the construction of the London and Brighton and other railway lines, and was afterwards engineer of the Manchester, Sheffield and Lincolnshire group of railways, besides many other lines, including the original "underground" or Metropolitan Railway, London. River improvement and the construction of large docks have also occupied his attention, and he was made K.C.M.G. in 1885 for his services as consulting engineer in the public works in Egypt; but his greatest work is the Forth Bridge, designed by him and Mr. B. Baker.

FOWLER, THOMAS, English philosopher, was born at Burton-Stather, in Lincolnshire, 1st September, 1832. He graduated at Merton College, Oxford, in 1854, and has ever since been closely connected with that university, first as tutor of Lincoln College, afterwards as professor of Logic from 1873, and as president of Corpus Christi College from 1881.

FOXBORO, a village and township of Norfolk county, Mass., 21 miles southwest of Boston. It has large manufacturing industries. Straw hats, bonnets, carpet-linings, soap and spring beds are made in the township. There is a granite quarry here. Population, 2,933.

FOX, GUSTAVUS VASA (1821-83), a United States naval officer. He entered the navy in 1838 as midshipman, and served until 1856, when he resigned with the rank of lieutenant. He then accepted the position of agent of the Bay State woolen mills at Lawrence, Mass. At the beginning of the civil war he was appointed Assistant Secretary of the Navy, and his services in this position were extremely valuable. Soon after the war he was sent on a special mission to Russia to convey to the czar the congratulations of the United States Congress on his escape from assassination. Capt. Fox subsequently became manager of the Middlesex mills.

FOX INDIANS. See INDIANS, AMERICAN, in these Revisions and Additions.

FOX RIVER, the name of two streams rising in Wisconsin. (1) The Fox River, or Pishtaka (220 miles), flows south to Aurora, then southwest to the Illinois, which it enters at Ottawa. (2) The Fox River, or Neenah, after a tortuous but generally northeast course of about 250 miles, empties into Green Bay in Lake Michigan. Near its headwaters it approaches within $1\frac{1}{4}$ miles of the Wisconsin River, with which it is connected at Portage City, by a canal, and thus the Mississippi River and Lake Michigan are united.

FOXTAIL GRASS, a genus of grasses, distinguished by a spiked panicle, two glumes nearly equal, and generally united at the base, inclosing a single floret which has a single *palea* with an awn rising from a base. The species are chiefly natives of temperate countries.

FOYERS, a small river of Scotland, joins Loch Ness eight miles northeast of Fort Augustus. It is noted for its cascades; the lower fall, 90 feet high, is the finest cascade in Britain.

FRAME: in gardening, the covering of any kind of hotbed, flued pit, or cold pit, used for the culti-

vation of plants not sufficiently hardy for the open air. Frames are generally made of wood and glass, in one piece or in sashes, according to the size of the hotbed or pit.

FRAMINGHAM, in Middlesex county, Mass., comprises the villages of Centre and South Framingham and Saxonville. It has the oldest normal school in America. Among the articles manufactured here are carriages, woolen and straw goods, and shoes. Population (1890), 9,239.

FRANC, a French silver coin which forms the unit of the French monetary system. Introduced into France 6th May, 1799, it was extended to the other countries comprised in the Latin union—viz. Belgium, Italy, and Switzerland by the convention of 1865, and has since then been adopted by Roumania (1868), Spain (1871), Servia (1874), Bulgaria (1880), and Greece (1882). In Belgium and Switzerland the coin is known as the franc; in Italy, *lira*; in Greece, *drachma*; in Roumania, *lei*; in Servia, *dinar*; and in Spain, *peseta*. The franc is coined of silver, $\frac{833}{1000}$ fine, and weighs five grammes, its value being about $9\frac{1}{2}$ d. English money, or 19 cents of United States. One pound sterling = 25·2 francs. The franc is divided into 100 centimes, but the old division into 20 sous, valued at 5 centimes each, is still made use of in common life. There are in France silver coins of $\frac{1}{2}$, $\frac{1}{4}$, 1, 2 and 5 francs, and gold pieces of 5, 10, 20, 50 and 100 francs.

FRANCAVILLA, a town in the Italian province of Lecce, lies 22 miles west-southwest of Brindisi. It has tanning, cloth-weaving, and trade in wine and oil. Population (1881), 17,559.

FRANCE. For the geography, history, government and productions of France, from its earliest settlement to the close of the year 1879, see *Britannica*, Vol. IX, pp. 505-686. After the resignation of Marshal MacMahon and the election of M. Grévy to the presidency, the Republican party, under the leadership of the eloquent Gambetta, instituted various measures of doubtful expediency. The Communards were rehabilitated; the church was irritated by violent measures; the Tunis expedition was entered upon; and the peasant proprietors, the true conservative power in France, became distrustful of their chosen representatives. Gambetta's accession to the premiership was not calculated to allay the general distrust, and his death (1882), which left his party without a leader and the people without an idol, paved the way for internal discords, which seriously impaired Republican prospects. Owing to the vacillating policy of the ministry, French influence in Egypt was greatly weakened; and the Tonquin expedition and embroilments with China, which cost many lives and much treasure without perceptible returns, increased the general feeling of distrust. Accusations of jobbery and malversations brought against the son-in-law of M. Grévy led to the resignation of the latter, Dec. 2, 1887. In his message to the Senate and Chamber of Deputies he declared that they had practically summoned him to resign, and he yielded in order to avoid the possible consequences of a conflict between Parliament and the executive. M. Marie François Sadi-Carnot was elected President of the Republic and a new ministry formed, with M. Tirard as President of the Council.

The political situation became still further disturbed about this time by the efforts of Gen. Boulanger, who was supported in his schemes of personal political aggrandizement by the three reactionary parties—the Orleanists, the Imperialists and the Legitimists. Although Gen. Boulanger had performed no public service, and given no evi-

dence of any preëminent ability, he became a popular idol. He had said nothing and done nothing of significance, but he was supposed to entertain undying enmity to Germany, and this was enough to secure him a powerful following. Then, too, he was a convenient figure-head for a movement of discontent with the situation and a desire for a revision of the constitution; and the rational, practical, and undoubtedly liberal parliamentary institutions which the Third Republic had been instrumental in implanting in France seemed to be in serious jeopardy.

In the French Senatorial elections, Jan. 5, 1888, the Republicans lost three seats, and early in April a new ministry was formed with M. Floquet as President of the Council. Gen. Boulanger was elected to the Chamber of Deputies from the Department du Nord, April 15, by over 96,000 majority, and at once became the leader of the opposition to the government. After a stormy debate a motion by Gen. Boulanger for the dissolution of the Chamber was rejected by that body, July 12, and a vote of censure passed upon him, whereupon he resigned; but at the election in Paris, which took place Jan. 27, 1889, he was reelected by a majority of 54,432. On Feb. 14, Premier Floquet tendered the resignation of the cabinet, and a new cabinet, with M. Tirard as premier, was announced Feb. 21. By a resolution adopted April 4, the French Chamber decided to prosecute Gen. Boulanger for threatening the peace of the Republic. The trial began before the High Court of the Senate Aug. 8, and resulted in the conviction of the General, together with Count Dillon and Henri Rochefort, of conspiracy and attempt at treason. They were condemned to transportation and imprisonment in a fortified place; but Gen. Boulanger escaped to England. His connection with a plot for the restoration of the Orleanists was proved and in 1891 he committed suicide.

Within the four years following the downfall of Boulangerism France underwent numerous changes of ministries and her institutions suffered from many strains. The failure of the Panama Canal scheme led to the prosecution of Comte de Lesseps (q. v.) and his son; of Gustave Eiffel (q. v.), and of many politicians and ex-ministers, who were convicted of bribery and corruption in January, 1893, and sentenced to imprisonment and fine. The sentence against the elder De Lesseps was not carried into effect on account of his health. The foes of the Republic—Bonapartists, Orleanists and Clericals—took advantage of all these facts to operate against the government, but met with poor success.

The latest official statistics place the area of France at 204,092 sq. miles, and the population (April 12, 1891), at 38,343,192; density per square mile, 187. Notwithstanding a moderate death-rate the population of France increases more slowly than in most States of Western Europe, owing to the low rate of births. In 1889 there were 111 births for every 100 deaths, but in 32 departments, mostly in the south, the deaths were in excess of the births.

Public education in France is entirely under the supervision of the government. In 1890 there were only 59 communes which had no primary school, public or private. The public funds, communal, departmental and state, devoted to primary instruction in 1888, amounted to 150,000,000 francs. In 1889, 4,622,619 children of school age were enrolled in primary and infant schools. About 78,000 are taught in higher schools, and nearly 10,000 at home, while many children between 11 and 13 years of age discontinue attendance at school, having received certificates of primary instruction.

The number of untaught children is thus very small.

The budget estimates for the revenue for 1892 were 3,780,077,692 francs, and the estimated expenditures 3,779,499,084 francs. The total capital of the French national debt cannot be exactly determined, but the most usual estimate is 32,000,000,000 francs (about \$6,400,000,000).

The military forces of France are organized on the basis of laws voted by the National Assembly in 1872, supplemented by further organization laws, passed in 1873, 1875, 1882, 1887, and 1889. These laws enact universal liability to arms. Substitution and enlistment for money are forbidden, and it is ordered that every Frenchman not declared unfit for military service may be called up, from the age of twenty to that of forty-five years, to enter the active army or the reserves. By the law of 1882, supplemented by that of 1888, the yearly contingent must serve three years in the active army, 6 in the reserve, 6 in the territorial army, and 10 in the territorial reserve. The active army is composed of all the young men, not otherwise exempted, who have reached the age of 20, and the reserves of those who have passed through the active army. Neither the active army nor its reserves are in any way localized, but drawn from and distributed over the whole of France. On the other hand, the territorial army and its reserves are confined to fixed regions, determined from time to time by administrative enactments. According to the budget for 1891, the peace strength of the whole French army is composed of 573,277 men and 142,870 horses, an increase of 17,947 men and 4,569 horses over 1890. In addition to this the territorial army numbers 37,000 officers and 501,716 men. Taking into account the various classes of reserves, France has a war force of about two and one-half millions of men at her disposal; and, taking account of the various classes of able-bodied men whose services have been dispensed with, the total number amounts to 3,750,000.

Of the total area of France (52,857,199 hectares) 8,397,131 hectares are under forests, and 36,977,098 hectares under all kinds of crops, fallow, and grasses. The production of wine and cider in 1890 amounted to 27,416,000 hectolitres; and the value of the crop of chestnuts, walnuts, olives, and plums in 1889 was 109,516,741 francs. January 1, 1890, the number of farm animals in France were: Horses, 2,881,153; cattle, 13,508,252; sheep, 21,996,731; pigs, 6,037,743; goats, 1,505,470. Silk culture is carried on in 23 departments. In 1889 the production of cocoons was 7,409,830 kilogrammes; 951,830 kilogrammes of cocoons were exported, valued at 9,756,258 francs, and 71,428 kilogrammes of silkworm's eggs, valued at 5,714,240 francs. The mineral and metal products for 1889 were, in tons: Coal, 24,588,880; pig iron, 1,722,480; finished iron, 793,358; steel, 529,021.

The official figures for 1887 of the woolen, cotton, and silk industries, are as follows:

	Woolens.	Cottons.	Silks.
Works.....			1,256
Number of mills.....	1,987	895	1,016
Operatives.....	100,372	121,843	108,819
Horse-power.....	40,466	68,112	28,777
Spindles.....	3,151,871	5,039,263	1,109,466
Power looms.....	44,682	72,784	51,399
Hand looms.....	25,399	28,213	44,287

The value of imports and exports of cotton in millions of francs appears as follows:

Years.	Imports.		Exports.	
	Yarn.	Cloth.	Yarn.	Cloth.
1867-76	24.4	47.2	4.5	66.4
1877-86	35.0	67.9	2.4	33.3
1887	31.1	50.2	3.5	117.5
1888	25.8	41.0	2.7	106.3
1889	29.4	41.3	3.1	116.2

The values of the yearly imports and exports of woollens and silks in millions of francs are seen from the subjoined table:

Years.	Woolens.				Silks.	
	Imports.		Exports.		Imp'ts.	Exports.
	Yarn.	Cloth.	Yarn.	Cloth.	Yarn.	Cloth.
1867-76	18.8	67.6	32.7	286.1	30.9	429.6
1877-86	17.0	77.3	38.1	349.0	40.9	251.0
1887	12.4	63.9	39.6	350.4	53.3	209.8
1888	14.1	65.2	37.2	325.4	50.5	223.2
1889	12.9	67.8	55.5	364.4	58.1	260.8

In 1888-89 there were 380 sugar works (including two distilleries), employing altogether 54,376 operatives, and 43,561 horse-power. It is estimated that the total annual yield of all French industries amounts to 12,800,000,000 francs.

In 1889 the total imports amounted to 5,320,000,000 francs, and the exports to 4,803,000,000 francs. The principal articles of import were wine, raw wool, cereals, raw silk, raw cotton, timber and wood, hides and furs, oil seeds, coffee, coal and coke, fruits, cattle, sugar, woolen, silk and cotton textiles, and flax. The principal articles of export were woolen, cotton and silk textiles, wine, raw silk and yarn, raw wool and yarn, small ware, leather goods, linen and cloth, metal goods (tools), cheese and butter, spirits, sugar, skins and furs, and chemical produce.

The public roads comprised in 1888: National roads, 37,706 kilometres; departmental roads, 29,900 kilometres; local roads, 602,500 kilometres. French railroads have grown from 9,086 kilometres in 1860 to 33,189 kilometres in March, 1890, of which 2,628 kilometres belonged to the state. The total length of the telegraphic lines on Jan. 1, 1889, was 88,047 kilometres, with 276,527 kilometres of wires, and 237 kilometres of pneumatic tubes at Paris.

FRANCIS JOSEPH I, emperor of Austria and king of Hungary, was born August 18, 1830, and succeeded to the throne of Austria, Dec. 2, 1848, on the abdication of his uncle, Ferdinand I. In April, 1854, he married the Princess Elizabeth, daughter of Duke Maximilian-Joseph. Their son, the Crown Prince Rudolf, born in 1858, married in 1881 the Princess Stéphanie of Belgium, and committed suicide, January 30, 1889. The heir presumptive to the throne is the Archduke Charles Louis, born July 30, 1833, who is married to a daughter of Dom Miguel of Portugal. Francis Joseph, on ascending the throne, promised to govern as a constitutional monarch, but also immediately dissolved the national assembly and assumed absolute power. Rebellion in Hungary was put down with the help of Russia, and the Italian provinces were held by the iron hand of Radetsky. The Austrian emperor remained neutral during the Crimean war. In 1855 he signed a concordat

with the Pope, giving the clergy full power over education. In 1859 occurred the war with France and Italy, when Francis Joseph took the field in person. The decisive Austrian defeats at Magenta and Solferino led to the treaty of Villafranca, by which Austria lost Lombardy. In the spring of 1864 the Austrians and Prussians combined to rob Denmark of the Schleswig-Holstein duchies, and the quarrel over the spoils led in June, 1866, to war between Austria and the combined forces of Prussia and Italy. The Seven Days' war, which ended at Sadowa, broke the power of Austria. By the treaty of Prague Francis Joseph gave up to Italy all Venetia and the Fortresses of the Quadrilateral, and surrendered to Prussia the duchies and all claim to control in Germany. In 1865 the emperor adopted a policy of conciliation toward Hungary, and on June 8, 1867, he was crowned king of that country. A more liberal form of government was granted to the dual monarchy, a civil marriage bill was passed, and in July, 1870, the concordat was suspended. Since that time Francis Joseph has reigned as a constitutional monarch.

FRANKING PRIVILEGE, a right formerly enjoyed by government officers of sending letters and packages by mail free. The privilege belonged to members of the British Parliament from about 1660 till 1840, and, owing to the high rate of postage, was greatly abused. It was abolished on the establishment of penny postage. In America it was first granted by Congress, in 1776, to private soldiers actually in service, and was gradually extended to Senators, members of Congress, secretaries, bureau officers, postmasters, delegates, etc. The matter thus franked covered not only letters and newspapers, but also public documents, executive papers, and printed matter, the privilege being practically unlimited. Various partial reforms were from time to time attempted by legislation, and on Jan. 31, 1873, an act was passed entirely abolishing the franking privilege.

FRANKL, LUDWIG AUGUST, Baron, a German Jewish poet, born Feb. 3, 1810, at Chrást, in Bohemia, and educated at Prague and Leitomischl. He studied medicine at Vienna, but soon devoted himself to literature. In 1851 he was made professor of aesthetics in the Vienna Conservatory of Music. In 1856 he went to Jerusalem to found a school, and after his return was for some years in charge of an institute for the blind at Vienna. In 1877 the Emperor of Austria conferred on him the title of Baron of Hochwart.

FRANKLAND, EDWARD, D. C. L., LL. D., Ph. D., an English chemist, born near Lancaster, Jan. 18, 1825. He was appointed professor of chemistry in Owens College in 1851, Bartholomew's Hospital in 1857, the Royal Institution in 1863, the Royal College of Chemistry in 1865, and the Normal School of Science, South Kensington, in 1881. The latter position he resigned in 1885. He was elected a Fellow of the Royal Society in 1853, a corresponding member of the French Academy in 1866, and afterwards of other learned bodies. He has collected many of his papers in *Experimental Researches in Pure, Applied, and Physical Chemistry*, (1878), and published, in addition to manuals and lectures, works on lighting, sanitation, etc.

FRANKLIN, a city and county-seat of Johnson county, Ind., about 75 miles from Terre Haute. It has a college, expensive school buildings, saw mills, and flouring-mills. Population (1890), 3,781.

FRANKLIN, the county-seat of Simpson county, Ky., 51 miles north of Nashville. It has two colleges, a woolen factory, and flour mills. Pop., 2,324.

FRANKLIN, a railroad junction of Norfolk county, Mass., 28 miles southwest of Boston. It

contains Deane Academy, and establishments where woolen and straw goods are manufactured.

FRANKLIN, a village of Merrimack county, N. H., situated at the union of the Pemigewasset and Winnipisogee Rivers, the sources of the Merrimack. It has a paper mill, woolen mills, machine shops, and wood-working shops. Population, 4,085.

FRANKLIN, a city, railroad-center, and county-seat of Venango county, Pa., situated on Allegheny River at the mouth of French Creek. It has oil refineries, machine shops, carriage factories, and flour mills. Population (1890), 6,221.

FRANKLIN, the county-seat of Williamson county, Tenn., on Harpeth River, 18 miles south of Nashville. It contains a Masonic temple, Tennessee Female College, and Harpeth Male Academy, and among its business establishment are carriage manufactories, steam cotton-gins, a planing-mill, flour mills, and a furniture factory. Two battles of the civil war were fought here—April 10, 1863, and Nov. 30, 1864. Population (1890), 2,250.

FRANKLIN, WILLIAM BUEL, a United States soldier, born in 1823. He entered the army in 1843, and served in topographical engineers until the outbreak of the civil war, when he had attained the rank of captain. In 1861 he was appointed colonel of the 12th infantry, brigadier-general of volunteers the same year, and major-general in 1862. He then received the brevet of brigadier-general in the Regular Army, and in 1865 that of major-general. He resigned in 1866, and has since been engaged in various manufacturing enterprises. He was Connecticut State commissioner at the Centennial exposition of 1876, Presidential elector the same year, and adjutant-general of Connecticut in 1877 and 1878. In 1880-87 he was president of the board of managers of the National Home for disabled soldiers.

FRANKLINIA, a species of ternstroemiaceous shrubs or small trees, the *Gordonia pubescens*, formerly native to central and southeastern Georgia, but now known only in cultivation, is much prized as an ornamental evergreen, and for its beautiful, large white flowers.

FRANKLIN ISLAND, off the coast of Knox county, Maine, lies on the west side of the entrance of St. George's River. There is a brick light-house at its northern point. Lat. 43° 53' 31" N., long. 69° 22' 10" W.

FRANKLIN LAKE, in Elko county, Nevada, on the east side of the East Humboldt Mountains. It is nearly fresh, very shallow, and has no outlet. The tulé (*Scirpus validus*) grows abundantly in the lake.

FRANK-PLEDGE, a custom prevailing in England before the Norman Conquest, whereby the freemen of a neighborhood were responsible for the good conduct of each other. Ten men formed an association called a *tithing*, in which the ten men were answerable each for the others, so that if one committed an offense, the other nine were liable for his appearance to make reparation. Should the offender abscond, the members of the tithing, if unable to clear themselves from participation in the crime, were compelled to make good the penalty.

FRANZ, ROBERT, a German composer, born at Halle, June 28, 1815, studied under Schneider at Dessau, and in 1843 published a set of twelve songs, which won the warm praises of Schumann, Mendelssohn, Liszt, and other masters. He was organist of a church at Halle, and was very active in the department of church music. He was also professor in the conservatory of music and conducted large concerts. He has published over 250 songs for single voices, a Kyrie, and several chorales and

four-part songs, besides arrangements of the masterpieces of Bach and Handel. In 1877 he was obliged by deafness to give up his various positions, and to discontinue his musical work.

FRANZOS, KARL EMIL, a German author, of Jewish parentage, was born Oct. 25, 1848. He now resides in Berlin. His chief power as a writer is found in ethnographical description, especially in the form of romance. His works have been translated into almost every European language. The translation of *The Jews of Barnow* and *A Fight for the Right* have attracted special attention in England.

FRASER, ALEXANDER, R.S.A., was born in 1827, at Woodcockdale, near Linlithgow. Early showing a taste for art, he received his first instruction from his father, an able amateur. His first appearance in the Academy Exhibition was with a figure picture, *A Gipsy Girl in Prison*. But he soon abandoned the figure for landscape. He has made many sketches, and painted many pictures.

FRASER, ALEXANDER CAMPBELL, a Scottish metaphysician, born at Ardehatten, Argyllshire, Sept. 3, 1819, and educated at the Universities of Glasgow and Edinburgh. He became a Free Church minister, in 1856 succeeded Sir William Hamilton in the chair of logic and metaphysics at Edinburgh, and in 1859 became Dean of the Faculty of Arts. His edition of Berkeley's works, in four volumes, with dissertations and annotations, a life of the bishop, and an account of his philosophy, was issued by the Clarendon Press in 1871, *Selections from Berkeley* in 1874, and in 1881 his monograph on *Berkeley* was published in Blackwood's *Philosophical Classics*, to which series he also contributed *Locke* (1889).

FRASER, CHARLES (1782-1860), an American artist. In 1807 he began the practice of law in Charleston, S. C., and in 1818 retired, in order to devote himself exclusively to art. He paid particular attention to miniature painting, and in 1825 produced a portrait of Lafayette, and subsequently of a great number of citizens of South Carolina. He also painted numerous landscape and *genre* pictures, and in 1857 his works were exhibited in Charleston. He contributed to various periodicals, and published *Reminiscences of Charleston*.

FRASER, JAMES, an English bishop, born at Prestbury, near Cheltenham, in 1818, died Oct. 22, 1885. He graduated at Lincoln College, Oxford, in 1839, and in 1840 was elected to a fellowship at Oriel. Ordained in 1846, he held the living of Cholderton, Wiltshire, from 1847 to 1860, and that of Upton Nervet, near Reading, from 1860 to 1870. In 1870 he was consecrated bishop of Manchester. He published valuable reports on elementary education in England, on the educational systems of the United States and Canada, and on the employment of children. He also published a number of sermons, and two volumes appeared posthumously (1887).

FRATRES ARVALES, an association of twelve priests of ancient Rome, whose duties were connected with agriculture. The office was established at a very early date, and continued into the fourth century. One of the hymns chanted by them, contained in an inscription A. D. 218, and preserved in the sacristy of St. Peter's, is regarded as a specimen of the earliest Latin.

FRATTA-MAGGIORE, a town of Italy, six miles northwest of the city of Naples, has extensive rope-works, and furnishes great quantities of strawberries, also silk worms. Population, 10,800.

FRAUDULENT CONVEYANCE, a conveyance intended to defraud another who is not a party to such conveyance, or the intent of which is to avoid some debt, duty or obligation on the part of the party making it. Two famous English statutes

declare such conveyance void; a statute with substantially the same provisions has been enacted throughout the United States.

FRECHETTE, LOUIS HONORÉ, born in Quebec, Nov. 16, 1849; has long been connected with the press of Canada, and has published several volumes of poems. In 1884 he became chief editor of *La Patrie*, Montreal.

FREDERICK III., King of Prussia (Frederick I. of Germany), formerly known as "Unser Fritz," the Crown Prince of Prussia, was the son of Emperor William I., of Germany, and was born at Potsdam, Oct. 13, 1831. He was an interested witness of the scenes of the revolution of 1848, and it is more than probable that to the influence exerted by these scenes was due his liberal spirit in after years. In 1861 his father ascended the throne of Prussia as William I., and he was at that time a general in the army—having all through his life been the subject of thorough military training. He had previously married (in 1857) Princess Victoria Adelaide, the eldest daughter of Queen Victoria of England. The issue of this marriage was seven children, the eldest being the present Emperor William III., who was born in 1859. Frederick took part in the war of 1866 between Denmark and the coalition of Prussia and Austria, and also commanded one of the armies of invasion in the subsequent war between Austria and Prussia, and took a leading part in the decisive battle of Sadowa. During the Franco-Prussian war of 1870 he commanded the army corps which invaded France through the territories of Alsace and Lorraine, and for his distinguished services he was made field marshal-general, the highest military dignity known to the Prussian service. After the war was over he returned to Berlin and was engaged in civil duties, assisting his father in the administration of the affairs of the empire (of which he had become, by the crowning of his father as emperor, the prince imperial), and at this period of his life spent considerable time in foreign travel. He was not in sympathy with the extreme policy of Bismarck, but their amicable relations suffered no serious interruption. In his domestic relation he was plain, unostentatious; a good husband and a kind father; and although his entire life had been spent in the midst of soldiery and military surroundings, he was disinclined to war, and an ardent advocate of peace. He was universally beloved for his sterling qualities, and during his last illness was the object of more sympathy and tender solicitude than had ever before been the lot of any sovereign to receive. In March, 1888, on the death of his father, the Emperor William I., he ascended the imperial throne, and his brief reign of three months has a melancholy interest on account of his sufferings, borne with such heroic fortitude. He was never formally crowned, on account of his physical inability to undergo the fatigue incident to the ceremony, and he died at Berlin, June 15, 1888, surrounded by his family and the officials of his household.

FREDERICK, EMPRESS (Princess Royal of England), was born Nov. 21, 1840, wife of Emperor Frederick III. of Germany, and mother of the present emperor, William II.

FREDERICKSBURG, the county-seat of Gillespie county, Texas, 85 miles west of Austin. It has flour and saw mills, and a flourishing trade in corn and wheat. Population, 1,352.

FREDERICKSBURG, Va. Military outpost of Richmond. See *Britannica*, Vol. IX, p. 742.

FREDERICKTOWN, the county-seat of Madison county, Mo., 105 miles south of St. Louis. The famous Mine la Motte lead mines are in the vicinity. Population, 1,000.

FREDONIA, a flourishing village of Chautauqua county, N. Y., 3 miles from Lake Erie. It has a State normal school, an academy established in 1824, and a carriage manufactory. Grapes and garden-seeds are raised for sale, and the village for over forty years has been lighted by natural gas. Here was organized the first Patrons of Husbandry grange. Population (1890), 3,399.

FREDONIA, a city and county-seat of Wilson county, Kan., in the southeastern part of the State. Population (1890), 1,515.

FREEBURG, a village of Snyder county, Pa., contains a musical college, and the principal business of the vicinity is farming and ore-mining.

FREEDMEN'S BUREAU, THE, originated in the needs growing out of the abolition of slavery. To meet the grave questions raised by this state of things, the Freedmen's Bureau act was approved in 1865, giving the bureau the management of abandoned lands and of all matters relating to freedmen and refugees in any district under the jurisdiction of the army. These powers were afterwards enlarged to embrace "the care of all refugees and freedmen so far as to enable them to become practically self-supporting United States citizens." The Freedmen's Bureau was but a temporary expedient, closing with its temporary need.

FREEHOLD, the county-seat of Monmouth county, N. J., 24 miles east of Trenton. It has a machine shop, planing mill, iron foundry, and a fine monument erected in 1884 to commemorate the battle of Monmouth, 1778. Population, 2,932.

FREE-LANCES, roving companies of knights and men-at-arms, who, after the Crusades had ceased to give them employment, wandered from state to state, selling their services to any lord who was willing to purchase their aid in the perpetual feuds of the Middle Ages. They played their most prominent part in Italy, where they were known as *Condottieri*.

FREEMAN, EDWARD AUGUSTUS, D.C.L., LL.D., was born in Staffordshire, England, in 1823; was elected scholar of Trinity College, Oxford, in 1841, and fellow in 1845. He was afterward examiner in law and modern history, and in 1884 became regius professor of modern history. His great work is the *History of the Norman Conquest*, one of the leading historical productions of the century. Mr. Freeman was a member of many learned societies, and was decorated by half a dozen governments. He wrote extensively on architecture, history, and conquests of the Saracens, federal government, the Ottoman power in Europe, English and European history, and many other subjects. Mr. Freeman was the leader of what has been called the Teutonic school in English history, and he probably, carried away by his prepossessions, placed too great reliance on the evidence offered by the language and institutions, and overestimated the Teutonic element in the blood of the English people. He maintained a high ideal of the dignity of real history and the necessity for truth, and made unsparing onslaught on writers who made the true subordinate to the picturesque. He died in 1892.

FREEMAN, JAMES, clergyman, born in Charlestown, Mass., April 22, 1759; died Nov. 14, 1835. He was educated in the Episcopal Church, but adopted Unitarian tenets, and was the first American minister of that persuasion. Harvard made him D.D. in 1811.

FREEMAN, JAMES EDWARD, born in Nova Scotia in 1808; died in England in 1884. He became an associate of the National Academy of Design in New York in 1831, and an academician two years later. He painted principally portraits and *genre* pictures.

FREEMASONRY, an ancient and secret institution, at first composed of masons or builders, but now embracing among its members men of every rank and condition of life, of every nation and of every religion which acknowledges a Supreme Being and believes in the immortality of the soul. See *Britannica*, Vol. IX, pp. 747-52; also *SECRET AND BENEVOLENT SOCIETIES IN THE UNITED STATES*, in these Revisions and Additions.

FREE PORT, a port at whose wharves the vessels of all nations can load and unload free of customs duties and commercial charges, with the exception of the usual harbor dues. A free port is thus, from the commercial point of view, an open harbor in contradistinction to one that is closed to all vessels except those of the country in which it is situated, and from the administrative point of view financially a foreign territory within the state to which it politically belongs. In the Middle Ages free ports were established for the purpose of attracting trade to particular maritime centers, especially by Italy, France, Spain, Austria and Portugal, at the period when the exploitation of their colonies for the benefit of the mother-country was the ruling principle in the commercial policy of those states. In the end of the 18th and the beginning of the 19th century free ports acquired a position of peculiar importance during the years in which prohibitive and protectionist measures were in force. Since then, however, they have decreased both in importance and in number. At the present time their chief use is that of *entrepôts* for facilitating the more convenient interchange and distribution of commodities destined for more or less distant markets. To all intents and purposes their utility has been destroyed by the rival system of bonded warehousing, which has always prevailed in England and the United States in preference to the other system. In 1889 the only free ports remaining in Europe were Trieste and Fiume in Austria, and Hamburg and Bremen in Germany; but both Trieste and Fiume were on the point of being abolished as free ports, whilst in Hamburg and Bremen since 1888 only a restricted area has been maintained as a free port. Among free ports outside of Europe are Hong-kong, Menado in Celebes, Singapore, Georgetown (Penang), Amboyna, Banda, Ternate, St. Thomas (on the island of the same name in the West Indies), and Livingstone in Guatemala.

FREEPORT, a city of Illinois, county-seat of Stephenson county (see *Britannica*, Vol. IX, p. 752). Freeport has excellent railroad facilities, being at the western terminus of a division of the Chicago and Northwestern Railroad, and at the crossing of the Illinois Central and Western Union Railroads. Freeport College (Presbyterian), established here in 1872, is a flourishing institution. The city is largely engaged in trade and manufactures, and its growth, though not rapid, is substantial. Population in 1880, 8,515; in 1890, 10,159.

FREEPORT, a village of Queens county, L. I., N. Y., on the South Side Railway, and 24 miles from Brooklyn. Oyster planting and fishing are the chief industries. Population, 1,300.

FREE-SOIL PARTY. See *POLITICAL PARTIES*, in these Revisions and Additions.

FREESTONE, any rock which admits of being freely cut and dressed by the builder. It has also been defined as any rock which works equally freely in every direction, having no tendency to split in one direction more than in another. In this sense limestone and even granite have been called freestone.

FREE TRADE, a term which means, in a literal sense, trade or commercial intercourse free from

all artificial interferences or restrictions. The phrase also denotes one of the most important and fundamental doctrines in political economy, its adherents maintaining that the prosperity of a state or nation will be best promoted by permitting a free exchange of all commodities between its own people and those of foreign countries to the greatest possible extent. During the last few years the literature on the subject of free trade has become so abundant and widespread in the United States that an elaborate article on this subject is unnecessary. See *Britannica*, Vol. IX, pp. 752-62.

FREEZING, the congelation of liquid substances through abstraction of heat. The freezing point of water under ordinary circumstances is 32° Fahr., or 0° Cent. The freezing point is lowered, however, by an increase of pressure. This is the case with all substances which expand in freezing, but on the other hand the freezing point of substances which contract on solidifying is raised by pressure.

FREEZING, ARTIFICIAL. For many years prior to the beginning of the 19th century artificial freezing was merely an interesting experiment performed in laboratories. Subsequently, however, attempts were made to manufacture ice for economic purposes, and four methods advanced with varied success: (1) by freezing mixtures; (2) by the absorption of caloric into vapor, that of water being the best suited for the purpose; (3) the re-expansion of compressed air, which extinguishes caloric in the gas; and (4) by radiation into cosmical spaces. The machines used for making ice are inventions by which a commixture or solution of the substances to be employed is made to flow along a metallic surface containing the substances to be cooled, non-conductors of heat being employed to protect them from radiation and external heat.

FREEZING MIXTURE, a mixture that has the property of a rapid absorption of heat. It is generally composed of a solid mingled with one or more liquids, in which the solid dissolves, and in so doing causes a considerable absorption of heat.

FRELINGHUYSEN, FREDERICK, an American statesman, grandson of a Dutch pastor who emigrated to New Jersey in 1720, was born in 1753, graduated at Princeton, and was admitted to the bar in 1774. He raised a corps of artillery, and took part in the battles of Trenton and Monmouth Court-house; and he was a member of the Continental Congress in 1778 and 1782-83, and a United States Senator in 1793-96. In 1794 he was made a major-general of militia. He died in 1804.

FRELINGHUYSEN, THEODORE, born in New Jersey, March 28, 1787; died April 12, 1861. He studied law, and practiced in New Jersey, and from 1817 to 1829 was attorney-general of that State. In 1829 he was chosen United States Senator, and served until 1835. Afterward he was mayor of Newark, and in 1839 became Chancellor of the University of New York. In May, 1834, he was nominated for vice-president by the Whigs, Henry Clay heading the ticket. In 1850 Mr. Frelinghuysen became president of Rutgers' College, which position he held until his death.

FRELINGHUYSEN, FREDERICK THEODORE, born in New Jersey, August 4, 1817; died May 20, 1885. He practiced law and held minor offices in New Jersey, and in 1861 became attorney-general of that State. From December, 1866, to March 4, 1869, he served as United States senator. In 1870 he was nominated and confirmed as minister to England, but declined the appointment. In July, 1871, he was again elected to the United States Senate, and served until 1877. He was a strong Republican; voted for the conviction of Andrew Johnson, supported the civil rights bill, and was an ardent pro-

tectionist. He was a member of the Hayes-Tilden electoral commission. On December 12, 1881, he became secretary of state in President Arthur's cabinet, and held office until March 4, 1885.

FREMONT, JOHN CHARLES, born in Savannah, Ga., January 21, 1813. He was of French descent. In 1830 he was graduated at Charleston College, and in 1833 received the appointment of teacher of mathematics on the sloop of war *Natchez*; two years later he was made professor of mathematics in the United States navy. In 1839 he was commissioned lieutenant in the corps of topographical engineers, and in 1842 conducted a geographical survey of the then almost unknown region between the Missouri River and the Pacific Ocean. In May, 1843, he set out on a still longer expedition from the Rocky Mountains to the Pacific Coast. On his return, in 1844, he was brevetted captain, and in the spring of 1845 was sent to explore the great Western basin, and the maritime region along the Pacific, an expedition that resulted in the acquisition of California to the United States. These achievements brought him general notoriety, and he became popularly known as the "Pathfinder." During his absence from the Pacific Coast war was declared between the United States and Mexico, and General Kearney was sent to take possession from California. Frémont refused to obey some orders of the general, who was his military superior, was placed under arrest, and ordered to report at Washington. He was tried by court-martial, found guilty, and ordered to be dismissed from the service. President Polk sustained a part of the sentence, but remitted the penalty, and Frémont resigned his commission. In October, 1848, he fitted out, at his own expense, a large expedition, with the object of finding a practicable route over the mountains to California. After many hardships, he and his party reached Sacramento in the spring of 1849. Here he bought a large estate containing rich gold mines. In 1850-51 he was United States senator from California. In 1853 he led a fifth expedition along the line of the fourth, and in 1855 he settled in New York city. In 1856 he was the first candidate of the Republican party for President of the United States, and was defeated. When the civil war began Frémont was made major-general, in command of the Western department, his headquarters being at St. Louis. Here, without authority, he issued a proclamation freeing the slaves in his district, which was not confirmed by the government. Frémont was recalled from the West thereafter and placed in command in Western Virginia; here he was outgeneraled by the Confederate commander "Stonewall" Jackson. When General Pope was placed in command of all the forces in Western Virginia, Frémont resigned his commission and took no further active part in the war. In 1864 the Cleveland convention nominated him for the presidency, but he withdrew his name. Subsequently he devoted himself mainly to the promotion of a southern railroad across the continent, and spent much time in Europe for this purpose. In connection with this enterprise he was charged with irregularities in France, was tried while absent, found guilty, and sentenced to fine and imprisonment; but as he was absent the penalty could not be enforced. From 1873 to 1881 Frémont was governor of Arizona Territory; later he practiced law in New York city. On October 19, 1841, Frémont was secretly married to Jessie, daughter of Senator Thomas H. Benton, of Missouri. In May, 1890, Congress placed him on the retired list of the army, with the rank of major-general, and on July 13, 1890, he died. His publications include a *Report of the Exploring Expedition to the Rocky Mountains in 1842*, and to Oregon and North

California in 1848-4 (Washington, 1848; New York, 1846; London, 1849); *Col. J. C. Frémont's Explorations*, an account of all five of his expeditions (2 vols., Philadelphia, 1859); and *Memoirs of My Life* (Chicago, 1886).

FREMONT, a village of Newaygo county, Mich., contains a tannery, lumber and stave mills, and a chair factory. South of this village is Fremont Lake, a pleasant summer resort. Pop. (1890), 1,097.

FREMONT, a city and county-seat of Dodge county, Neb., and a great market for cattle, horses, hogs, and sheep. It has a normal and a business college, water works, gas and electric lights, telephone system, pork-packing houses, planing-mills and flouring-mills. Population (1890), 6,747.

FREMONT, a village of Wayne county, N. C. It has lumber mills, a wool-carding establishment, cotton-gins, and a good trade in lumber, cotton, and naval stores. There is a mineral spring in the vicinity.

FREMONT, capital of Sandusky county, Ohio, is situated on the Sandusky River, at the head of navigation, thirty miles east of Toledo by rail. Steamers ply between the city and the principal ports of Lake Erie, and it has manufactories of woollens, sashes and blinds, flour mills, and engineering works. Population in 1890, 12,500.

FRENCH BROAD RIVER rises in the western part of North Carolina, near the Blue Ridge, flows northward into Tennessee, thence northwest; then southwest, joining the Holston River about three miles above the city of Knoxville. It is about 200 miles in length, and is navigable by steamers for a distance of 30 miles.

FRENCH INDIA. The French possessions in India, as established by the treaties of 1814 and 1815, consist of five separate towns, which cover an aggregate of 50,803 hectares (about 200 square miles), and had on Jan. 1, 1889, the following estimated populations:

Pondichery.....	41,253
Karikal.....	34,719
Oulgaret.....	46,529
Villénour.....	35,983
Nedoukadou.....	33,487
Shandernagar.....	35,395
Bahour.....	27,129
La Grande Aldée.....	23,350
Mahé.....	8,249
Yabaou.....	4,199
Total.....	280,303

Of this total over 270,000 are Indians. The colonies are divided into five *dépendances* and ten communes, having municipal institutions. The governor of the colony resides at Pondichery. The colony is represented by one Senator and one Deputy. Estimated budget (1890), 1,989,483 francs; expenditure of France (budget 1892), 307,218 francs; debt, 300,000 francs. The chief exports from Pondichery are oil seeds. The imports in 1889 amounted to 6,844,099 francs, and total exports 25,996,708 francs.

FRENCH INDO-CHINA. Under this designation the French dependencies of Cochin-China, Tonquin, Annam, and Cambodia have, to a certain extent, been incorporated. There is a Superior Council of Indo-China, which fixes the budget of Cochin-China, and advises as to the budgets of Annam, Tonquin, and Cambodia. In 1887 the French possessions in Indo-China, including Annam and Cambodia, were united into a customs-union. In 1890 the external trade of the union reached 60,248,460 francs for imports and 56,995,119 francs for exports.

FRENCH LICK, a township of Orange county, Ind. Twelve saline sulphur springs are situated in a pleasant valley of this township, and the waters are useful for the cure of some diseases.

FRENCHMAN'S BAY, an arm of the ocean extending 30 miles into Hancock county, Me., with a width of about 10 miles. Mount Desert Island lies between the bay and the Atlantic.

FRENCHTOWN, a manufacturing town of Hunterdon county, N. J., on the Delaware River. Among the articles made here are iron and brass castings, regalia, sashes and blinds, distilled liquors, and carriages. Population, 1,023.

FRENEAU, PHILIP (1752-1832), an American poet. He contributed to the "United States Magazine" and the "Freeman's Journal," and in 1790 became editor of the New York "Daily Advertiser." Later he was appointed translator for the State department, and at the same time assumed the editorship of the "National Gazette." He next became editor of the "Jersey Chronicle," and in 1797 of the New York "Time-piece and Literary Companion," but his connection with this paper was brief. Freneau published *A Poem on the Rising Glory of America* (1771); *Voyage to Boston* (1774); *General Gage's Confession* (1775); *The British Prison-ship* (1781); *The Poems of Philip Freneau, Written Chiefly During the Late War* (1786); *A Journey from Philadelphia to New York, by Robert Slender, Stocking-weaver* (1787); *The Miscellaneous Works of Mr. Philip Freneau* (1788); *The Village Merchant* (1794); *Poems Written Between the Years 1768 and 1794* (1795); *Letters on Various Interesting and Important Subjects, by Robert Slender* (1799); *Poems Written and Published During the American Revolutionary War* (1809); *A Collection of Poems on American Affairs* (1815); and a translation of Abbé Robin's *Voyages and Travels* (1783).

FREPEL, CHARLES EMILE, born in France, June 1, 1827, entered the priesthood and in 1870 became bishop of Angers. He was returned to the chamber of deputies as a legitimist in 1881 and reelected in 1885. He has written a criticism on Renan's *Vie de Jesus*, and many histories of the saints and fathers of the church.

FRERE, CHARLES THEODORE, a French painter, born at Paris, June 24, 1815, died in 1888. He studied art with Coignet and Roqueplan, and made his first public appearance at the exhibition of 1834. In 1836 he went to Algeria, was present at the taking of the city of Constantine by the French in October, 1837, and afterwards visited the East. His pictures are chiefly representations of Eastern scenes. Among the more famous of these are the *Hall of the Arabs*, which was bought by the French government in 1850; *A Harem at Cairo*; *Ruins of Karnak*; *The Island of Phile*; *The Caravan of Mecca*; *The Nile—Evening*, and *The Desert—Noon*.

FRERE, SIR HENRY BARTLE EDWARD, K. C. B., G. C. S. I., D. C. L., an English colonial officer, born in Wales, March 29, 1815, died in London, May 29, 1884. He was educated at Bath and at Haileybury College, and entered the Indian Civil Service in 1833. In 1847 he became British Resident at Sattara, and three years later chief commissioner of Sind. During the mutiny in 1857 he succeeded in keeping his own province in subjection and assisted his colleagues in adjoining provinces. In 1862 he was appointed governor of Bombay, which post he held until his return to England in 1867. In 1872 he was employed on a successful mission to Zanzibar for the suppression of the slave-trade, and in 1877 was appointed governor of the Cape, and high commissioner for the settlement of affairs in South Africa. There being considerable difference of opinion among English statesmen with regard to the justifiableness of Sir Bartle's course in the Zulu war, he was recalled by the government in 1880. He subsequently devoted himself to the duties entailed upon him by the presidency of various learned societies, and to the

promotion of missionary work. He published several works on Indian and African subjects.

FRÈRE-ORBAN, HUBERT JOSEPH WALTHER, a Belgian statesman, born at Liège, April 24, 1812, was called to the bar of his native city, and acquired a high reputation among the Liberal party. It returned him to the Belgian Chamber as its representative in 1847. He was minister of public works and then minister of finance in that year; and began the reform of the corn laws in Belgium, before Sir Robert Peel reformed the corn laws in England. M. Frère-Orban has been a cabinet minister (with but short intervals) for nearly half a century; he was the founder of the Banque Nationale, and of the Caisse d'Épargne, and, during his various administrations, much has been done to advance the country; octrois have been abolished; education has been extended; the salt tax repealed; the great camp on the Escaut, which ensures a free landing to Belgium's ally, has been established; and many laws passed for the regulation of labor, and for promoting the welfare both of capitalists and of workmen. The emperor of Austria conferred on him, in May, 1881, the Grand Cross of the Order of St. Stephen.

FRÈRE, PIERRE EDOUARD, a French painter, born in Paris, Jan. 10, 1819, died at Ecouen, May 23, 1886. He studied under Delaroche, and first exhibited in the Salon of 1843. Most of his pictures represent the amusements and occupations of country children, and they are characterized by much grace and purity of feeling. His best known works are: *The Little Gourmand; Boys Going from School; Girls Going from School; The Road to School; The Orphan's First Prayer; and Preparing for Church.* The last is in the Corcoran Gallery at Washington.

FRESHWATER STRATA are so named from their supposed origin. This can be easily determined from an examination of the contained fossils. Though the great proportion of aqueous rocks are of marine origin, yet freshwater strata are occasionally met with. The Yellow Sandstones of the Old Red or Lower Carboniferous period are freshwater beds.

FRESNILLO, a mining town of the Mexican state Zacatecas, lies 7,200 feet above sea-level, at the foot of the argentiferous Cerro de Proaño, and has amalgamation works, etc. Pop., 15,000.

FRESNO, an enterprising city of California, county-seat of Fresno county, about 20 miles east of San Joaquin River and 40 miles north of Tulare Lake. Pop. (1890), 10,818.

FRETTY. When six, eight or more pieces are represented crossing and interlacing like lattice-work, the shield is said to be fretty.

FREUND, WILHELM, German philologist, born of Jewish parents, Jan. 27, 1806, at Kempen in Posen. Having studied at Berlin and Breslau (1824-28), he taught at Breslau, Hirschberg (1848-51), and Gleiwitz (1855-70), and finally settled down at Breslau to a life of literary activity. His principal work is a *Wörterbuch der lateinischen Sprache* (4 vols. Leip. 1834-45), on which the best known English-Latin dictionaries are based. Besides this he has written a number of school books, especially on the Greek and Roman classics, and some on philology.

FREYCINET, CHARLES LOUIS DE SAULCES DE, a French statesman, born at Foix, Nov. 14, 1823, and educated at the École Polytechnique in Paris. Appointed in 1864 an ordinary engineer of the first class, he was until 1870 a member of the council of Tarn-et-Garonne. In October, 1870, Gambetta appointed him his subordinate in the war department. Elected to the senate in 1876, he became minister of public works in 1877, and premier in 1879, with the portfolio of foreign affairs. He resigned in 1880,

but formed a ministry again in 1882 and in 1886; and in 1889 he became minister of war under M. Tirard. In 1890 he became for the fourth time premier and minister of war. On February 19, 1892, the Freycinet ministry resigned. This ministry is noted as the longest in power since the formation of the present republic. Its government was wise and strong. It crushed the Boulangist conspiracy, held in check anarchy and socialism, and won a respect for republicanism before unknown in France. Under Freycinet the French army grew, until to-day it is the most complete organization for war ever known. M. Freycinet has published several works on engineering, sanitation, etc., of acknowledged excellence. In 1878 he was elected a member of the Academy of Sciences, and in 1891 of the French Academy.

FREYJA, in Scandinavian mythology, the goddess of love, who dispenses all joys, delights and pleasures. She was wont to drive out in a chariot drawn by two cats. She claimed one-half of those slain in battle. She wept golden tears for her husband, who had traveled into distant countries. This goddess was particularly worshipped in Sweden. Freyja gave her name as the general designation for all women of rank and wealth in medieval times (*fromva*=*frau*).

FREYR, or FREY: in Norse mythology, the god of peace and fertility, who presided over rain, sunshine and all the fruits of the earth, and to whom prayers were addressed for a good harvest. He was the son of Njord, and was held in great veneration, especially in Sweden and Iceland. His chief temple was at Upsala.

FREYSTÄDTL, or FREYSTADT, a town of Hungary, 15 miles northwest of Neutra, on the Waga, opposite Leopoldstadt. Various articles of wood are extensively manufactured, and there are important cattle markets. Population, 6,346.

FREYTAG, GUSTAV, a German writer, born July 13, 1816, at Kreuzburg in Silesia; studied at Breslau and Berlin, and from 1839 till 1847 was a lecturer on German language and literature in the former university. In 1848 he settled at Leipsic, where he edited the "Grenzboten" until 1870. Since 1879 he has resided at Wiesbaden. His dramas, *Die Valentine* (1847), *Graf Waldemar* (1850), and *Die Journalisten* (1853), proved brilliant successes; but his greatest achievement in literature is undoubtedly *Soll und Haben* (1855, 30th ed., 1885), a realistic novel of German commercial life, which was translated into English under the title of *Debit and Credit* (1858). Other of his works are *Die Verlorne Handschrift* (1864, Eng., *The Lost Manuscript*, 1865), and the series (1872-81), called *Die Ahnen* (*Our Ancestors*), a series of stories illustrating German history from the earliest times; *Die Technik des Dramas*, the *Life of Karl Mathy*, *Doctor Luther*, 1883. Some of these works have been translated into English by Mrs. Malcolm.

FRIDESWIDE, St., daughter of Dida, an ealdorman, was the patroness of Oxford, where she was born early in the eighth century. She preferred a religious life to marriage with Algar, a great Mercian noble, who, coming in search of her, was struck blind. She was canonized in 1481. Catherine, Peter Martyr's wife, was buried beside her pillaged shrine in 1552; exhumed by Cardinal Pole, but re-interred there in 1561, when the remains of the virgin saint and of the ex-nun were indissolubly mingled together.

FRIEDRICH, KARL NIKOLAS, Imperial Prince of Germany, eldest son of Prince Karl (1801-85), second brother of Emperor Friedrich Wilhelm, born March 20, 1828, died June 15, 1885. He received a military education, entered the army in

his youth, was engaged in the Schleswig-Holstein war in 1864, and in the war against Austria in 1866 had command of the First Army. In the Franco-German war he commanded the Second German Army, defeated the French general Froissart at Speichorn, commanded in the siege operations against Metz, and after the surrender was made field-marshal. He afterwards recaptured Orleans, took Le Mans, and dispersed the Army of the Loire.

FRIEDRICH, JOHANN, a Roman Catholic theologian, born in Franconia in 1836. He was a leader with Dollinger in the Old Catholic movement. He became a professor of theology at Munich in 1865; assisted at the Vatican council in 1870, and subsequently, in life and labors, has been identified with the Old Catholics.

FRIEDRICHRODA, a town of Thüringen and a popular and favorite summer resort in the beautiful Schilfwasser valley, 13 miles southwest of Gotha by rail. The duke of Gotha's handsome country-seat, Reinhardtsbrunn, is situated here on the site of the old abbey of that name, which was destroyed in the Peasant war. The town has bleaching establishments and large laundries, supplied from Magdeburg, Berlin and Hamburg. Population, 3,146.

FRIEDRICHSDORF, a town in the Prussian province of Hesse-Nassau, on the southern slope of the Taunus, three miles northeast of Homburg. It was founded in 1687 by thirty-two Huguenot families, and its inhabitants still speak French.

FRIENDSHIP, a village of Allegheny county, N. Y. It is the seat of Baxter's Musical University, and has an academy and a furnace. Pop., 1,369.

FRIEZE, HENRY S., LL.D., born in Boston, Sept. 15, 1817; died in Detroit, Mich., Dec. 7, 1889. Graduated from Brown University in 1841, he became professor of the Latin language and literature in the University of Michigan in 1854, which position he held at the time of his death. He also twice acted as temporary president. Dr. Frieze collected in Europe the casts and the engravings that formed the nucleus of the present museum of art, and in many other ways was instrumental in the development of the university.

FRIGGA: in Northern mythology, a goddess who seems to have occupied an analogous position to that of Venus in Roman mythology. She was the wife of Odin, and was also the goddess of the earth and of marriage, being frequently confounded, and latterly quite identified, with Freyja. She was the only Scandinavian deity placed among the stars. From her Friday takes its name.

FRINGE TREE, a genus of plants of the natural order *Oleaceæ*, consisting of small trees or large shrubs, natives of America, the West Indies, and New Holland. The popular fringe tree or snow-flower found in the United States sometimes attains the height of 30 and 40 feet, has opposite, oval leaves 6 or 7 inches long, and numerous snow-white flowers in panicle racemes. The limb of the corolla is divided into four long linear segments; the fruit is an oval drupe. The tree is frequently cultivated as an ornamental plant.

FRISCHESHAFF ("Fresh-water Bay"), a lagoon on the coast of Prussia, southeast of the Gulf of Danzig, about 50 miles in length, 4 to 11 miles broad, and 332 sq. m. in area. It was once entirely walled off from the Baltic by a narrow spit of land, through which a passage, 1,247 feet wide and 14½ feet deep, was cut in 1510 during a violent storm. The Haff is 10 to 16 feet deep.

FRITH, WILLIAM POWELL, an English artist, was born in 1819 at Studley, near Ripon. At the age of 20 he exhibited his first picture at the British Institution, a portrait of one of the children of his

preceptor. In 1845 he became A.R.A., and in 1852 was made an academician. His two great pictures, *The Derby Day* and *The Railway Station*, have been engraved many times, and some of his productions, such as *Coming of Age*, *English Merry-making*, *The Village Pastor*, and *Life at the Seaside*, are almost equally well-known. In 1866 he exhibited *Before Dinner at Boswell's Lodgings in Bond Street*, which work was sold in 1875 for £4,567, up to that date the highest price ever given at auction for any picture during the artist's lifetime. Since that time Mr. Frith has constantly exhibited both illustrations of literature and pictures after the manner of his old successes. Of these *The Private View of the Royal Academy* (1881) has been the most ambitious. His Hogarthian series, *The Road to Ruin* (1878), is also well known. Mr. Frith published his *Autobiography* in 1887, and *Further Reminiscences* in 1888. He is a member of the Academies of Vienna, Belgium and Sweden. By his own desire, he was placed on the list of retired Royal Academicians, in 1890.

FROBISHER BAY, an inlet opening westward near the mouth of Davis Strait into the territory called by Frobisher *Mela Incognita*, at the southern end of Baffin Land. It is about two hundred miles long by above twenty wide, with rugged mountainous shores. It was, till Hall's voyage, called Frobisher Strait, being erroneously regarded as a passage into Hudson Bay.

FREBEL, JULIUS, nephew of Friedrich Froebel, the founder of the Kindergarten system, was born at Griesheim, Germany, July 16, 1806, and studied in the Universities of Munich, Jena and Berlin. He was professor of mineralogy at Zurich from 1833 to 1844; afterwards edited a radical political paper; removed to Prussia, but was obliged to leave for political reasons; took part in the revolution of 1848, and was elected to the German Congress at Frankfurt; was arrested and condemned to death for an attempt to excite a revolution in Vienna, but was pardoned. He subsequently traveled for several years in Central America, Mexico and California, returning to Germany as a naturalized American citizen. In 1862 he was an editor in Vienna, in 1867 founded a journal in Munich, in 1873 was made consul of the German empire at Smyrna, and in 1876 was transferred to Algiers in the same capacity. Among his publications are *Seven Years' Travel in Central America and the Far West* (1859); *Theorie der Politik* (1861-64); *Die Gesichtspunkte und Aufgaben der Politik* (1878); and *Die Realistische Weltansicht und die utilitarische Civilisation* (1881).

FROGMORE, an English royal palace and mausoleum in the park of Windsor, Berkshire. The palace, purchased by Queen Charlotte in 1800, has been one of the dwelling houses of the Prince of Wales since 1861. The mausoleum, a Romanesque edifice, cruciform in shape and surmounted by an octagonal dome, is consecrated to the memory of the Prince Consort, whose remains were transferred to it on Dec. 18, 1862.

FROHSDORF, a village in Lower Austria, 30 miles south of Vienna, on the river Leitha, and near the frontiers of Hungary. It is celebrated for its splendid castle, which acquired a kind of political importance through its having been from 1844 to 1883 the rendezvous of the elder Bourbon party and the residence of the Comte de Chambord.

FROND, a term used in botany to designate the leaves of cryptogamous plants.

FRONTENAC, LOUIS DE BUADE, COMTE DE, was born in 1620 and died in Quebec, November 28, 1698. He served in Holland under the Prince of Orange; at twenty-three was appointed colonel of a

regiment in Normandy, and at twenty-six was made a brigadier. Having served in Italy, Flanders, and Germany with marked success, he was appointed governor of New France (as the Canadian possessions were then called) in 1692. Frontenac modeled his government upon the old feudal pattern and brought upon him a severe rebuke from the King of France. Frontenac quarreled with the Jesuits, then all-powerful in Canada, and had a dispute with the governor of Montreal. Duchesneau was sent to Canada to administer the civil affairs of the province, Frontenac being allowed to retain the command of the army. Their relations became critical; Duchesneau sided with the Jesuits, while Frontenac violently opposed. The quarrel continued until both were recalled in 1682. In 1689, when the Iroquois were threatening Montreal, Frontenac was recalled. Though an old man, he was able to revive the courage of the colonists and to gain the respect of the Indians. He sent three war parties of French and Indians against the English, and finally repulsed Sir William Phips before Quebec in 1690. In 1696 he led an army into the heart of New York and laid waste Onondaga and Oneida. This with the successes of Iberville in Newfoundland and on Hudson Bay restored the fallen fortunes of the French. Though of a quarrelsome temper, Frontenac gained the respect and affection of the Indians by his conciliatory spirit and firmness.

FROSTBURG, a village of Allegheny county, Md., located on a plateau between Dan's and Savage mountains, 1,792 feet above sea-level and over the coal-basin of Western Maryland. The village has a fire-brick manufactory and foundries. Population (1890), 3,804.

FROTH-FLY, also called **FROTH-HOPPER**, **FROG-HOPPER**, **FROG-SPIT**, numerous insects parasitic on plants, on which the larvæ and pupæ are found surrounded by a frothy spittle. They are of the family *Cicadellidae*, order *Homoptera*, and are related to the amphideæ, cicadas, and lantern-flies. The family, which is large, consists of plant parasites, mostly small in size, often very beautiful in form and color. The young stages, which are very like the adults, except in the absence of developed wings, suck their plant hosts, and thereupon surround themselves with the familiar froth which issues from the hind end of the gut, and which is popularly called cuckoo-spit or frog-spittle, from fancies entertained as to its origin. It is sometimes so abundant, on willows for instance, that it drops from the branches. In some cases it may be helped by an exudation from the wounded plants. The adults have long hind-legs, and are able to hop about with some activity.

FROTHINGHAM, **NATHANIEL LANGDON** (1793-1870), an American clergyman. For a while he was an instructor in Harvard University, and from 1815 to 1850 was pastor of the First Congregational church (Unitarian) in Boston. He contributed to various religious periodicals, and published, besides many sermons, *Deism or Christianity* (1845); *Sermons in the Order of a Twelve-month* (1852); and *Metrical Pieces, Translated and Original* (1855).

FROTHINGHAM, **OCTAVIUS BROOKS**, an American author, born in 1822. In 1847 he was ordained pastor of the North church (Unitarian) at Salem, Mass. In 1855-59 he was pastor in Jersey City, N. J., and in 1860-79 had charge of the Third Unitarian Congregational Church, New York city. In 1881 he withdrew from specific connection with any church, and devoted himself to literature. Mr. Frothingham has contributed to various periodicals,

and published, besides more than 150 sermons, *Stories from the Lips of the Teacher* (1863); *Stories from the Old Testament* (1864); *Child's Book of Religion* (1866); *The Religion of Humanity* (1873); *Life of Theodore Parker* (1874); *Transcendentalism in New England* (1876); *The Cradle of the Christ* (1877); *Life of Gerrit Smith* (1878); *Life of George Ripley* (1882); and *Memoir of William Henry Channing* (1886).

FROTHINGHAM, **RICHARD** (1812-80), an American historian. For years he was proprietor, and in 1852-65 managing editor, of the Boston, Mass., "Post." In 1839, 1840, 1842, 1849 and 1850 he was a member of the Massachusetts legislature, and in 1851-53 was mayor of Charlestown. For several years he was treasurer of the Massachusetts Historical Society. He is the author of *History of Charlestown* (1848); *History of the Siege of Boston* (1849); *The Command of the Battle of Bunker Hill* (1850); *Life of General Joseph Warren* (1865); *Tribute to Thomas Starr King* (1865); and *Rise of the Republic* (1871); besides many addresses.

FROUDE, **JAMES ANTHONY**, an eminent English historian, youngest son of the Archdeacon of Totnes, born at Dartington, Devonshire, April 23, 1818. He was educated at Westminster and Oriel College, Oxford, and was elected a Fellow of Exeter College in 1842. He took deacon's orders in 1844, but having altered his religious views he wrote in 1848 a work entitled *The Nemesis of Faith*, in which the solemnity and sadness of religious scepticism are relieved by a singularly tender and earnest humanity. The book was written with great power, and cost Froude his fellowship and an educational appointment in Tasmania. For the next few years he employed himself in writing for "Frazar's Magazine" and the "Westminster Review," and in 1856 issued the first two volumes of his *History of England from the Fall of Wolsey to the Defeat of the Spanish Armada*, completed in 12 volumes in 1869. In this work Froude displays supreme literary ability, but, like Macaulay, who in the art of making history as fascinating as fiction is his only rival, he is a man of letters first and an historian afterwards, and the defects of his merits have sadly impaired the permanent value of his work; his views of men and motives are always distorted by being seen through 19th century spectacles; and these, moreover, spectacles of his own. Four volumes of brilliant essays and papers, entitled *Short Studies on Great Subjects*, appeared between 1867 and 1882. He became rector of St. Andrew's University in 1869, and received the degree of LL. D. His next history, in 13 volumes (1871-74), was *The English in Ireland in the 18th Century*. In 1874, and again in 1875, Froude visited the South African colonies on a mission from the home government, and published his impressions in *Two Lectures on South Africa*, in 1880. As Carlyle's literary executor Froude edited his *Reminiscences* in 1881, Mrs. Carlisle's *Letters* in three volumes, in 1882, and Carlyle's own *Life* in four volumes (1882-84). Among his several later works are *The Two Chiefs of Dunboy*, published in 1889, an historical romance of Irish life toward the close of the 18th century; and *A Life of Lord Beaconsfield*, in 1890.

FROZEN STRAIGHT, a passage about 15 miles wide, separating Southampton Island, in the north of Hudson Bay, from Melville Peninsula.

FRYE, **WILLIAM PIERCE**, a United States Senator, born in 1831, graduated at Bowdoin College, Maine, 1850; studied and practiced law; was a member of the State legislature in 1861, '62, and '67; was mayor of the city of Lewiston in 1866-67; was attorney-general of the State of Maine in 1867

'68, and '69; was elected a member of the National Republican Executive Committee in 1872, reelected in 1876. In 1880 he was elected a trustee of Bowdoin College; received the degree of LL.D. from Bates College in July, 1881, and the same degree from Bowdoin College in 1889. He was a presidential elector in 1864; was a delegate to the National Republican conventions in 1872, '76, and '80; was elected chairman of the Republican State Committee of Maine in place of Hon. J. G. Blaine, resigned in November, 1881; was elected a Representative in the 42d, 43d, 44th, 45th, 46th and 47th Congresses; was elected to the United States Senate as a Republican to fill the vacancy occasioned by the resignation of James G. Blaine, appointed Secretary of State; took his seat March, 1881, and was reelected in 1883, and again in 1888. His term of service will expire March 3, 1895.

FRUCTED. Trees when represented as bearing fruit are said, heraldically, to be fructed.

FRUCTIFICATION, a term frequently employed in cryptogamic botany, sometimes to denote the whole reproductive system, and sometimes the fruit itself.

FRUIT-PIGEON (*Carpophaga*), a genus of pigeons, including about fifty species, distributed over the whole Australian and Oriental regions, but much more abundant in the former. They live in forests, are well adapted for arboreal life, and feed on fruits. The gape is wide; the coloring of the plumage brilliant. The term fruit-pigeon is also extended to members of other genera—*treron*, *electras*, etc.

FRUITPORT, a summer resort and center of a fruit region in Muskegon county, Mich., at the mouth of Grand River. It has a magnetic mineral spring.

FRUSTUM: in geometry, the part of a solid next the base, left on cutting off the top by a plane parallel to the base. The frustum of a sphere or spheroid, however, is any part of these solids comprised between two circular sections, and the middle frustum of a sphere is that whose ends are equal circles, having the center of a sphere in the middle of it, and equally distant from both ends.

FRYKEN, a lake, or rather chain of lakes, in Sweden, stretching from north to south over a distance of about 40 miles and discharging into Lake Wenner by the Nors. They are surrounded by some of the finest scenery in Sweden.

FRYXELL, ANDERS, a Swedish historian, born Feb. 7, 1795, in Dalsland, died at Stockholm, March 21, 1881. He took priest's orders in 1820, and in 1828 became rector of a gymnasium in Stockholm. From 1847 until his death he devoted himself entirely to literary pursuits. His reputation rests upon *Berättelser ur Svenska Historien* ("Narratives from Swedish History" (46 vols., Stockholm, 1832-80). These narratives, largely biographical in form, soon obtained popularity in Sweden, and parts of them have been translated into almost all European languages. Another work, *Conspiracies of the Swedish Aristocracy* (4 vols. Upsala, 1845-50), was intended as a reply to the accusations urged against that class by Geiger and others, and involved Fryxell in a keen controversy with the democratic liberal party in Sweden. Besides these works he wrote a *Contribution to the History of the Literature of Sweden* (9 vols., 1860-62).

FUCA, or **JUAN DE FUCA**, STRAIT, a passage separating the State of Washington from Vancouver Island, and connecting the Pacific Ocean with the Gulf of Georgia. It contains several islands, one of which, San Juan, became the subject of a dispute between Great Britain and the United States, the question being whether it belonged to Washington (then

a territory) or to British Columbia. In 1872 the emperor of Germany, as arbiter, decided that the line of boundary should be run through the Strait of Haro, west of San Juan, thus awarding that island to the United States, and it and several neighboring islands now form a county of Washington. The county of San Juan had in 1880 a population of 948.

FUCACEÆ, a group of coarse olive-green seaweeds, belonging to the *Oösporeæ*. About 600 species are known, growing mostly in saltwater. Some attain a great size; *Macrocystis pyrifera* is said to have fronds 500 to 1,500 feet in length. Most of the *Fucaeæ* contain iodine in great quantity. They are also valuable for the soda they contain, which is an article of commerce.

FUENTE-ALAMO, a town of Spain, 18 miles south of Murcia. It is at the northern base of a range of hills, and at a short distance from the canal of Murcia. Population, 808.

FUENTE DE OVEJUNA, a small walled town of Spain, in the province of Cordova, is situated on the crest and sides of a conical hill, between two of the upper branches of the Guadati. It has manufactories of linens, woollens, and leather. Population, 2,919.

FUENTES DE ONORO (the Fountains of Honor), a small village of Salamanca, Spain, on the Portuguese frontier, 14 miles west of Ciudad Rodrigo. This place is celebrated as the scene of one of the important battles of the Peninsular War, between the French under Massena and the English under Wellington.

FUERTÉ DE ANDALGALA, or **ANDALGALA**, a town of the Argentine Republic, in the province of Catamarca, 75 miles north of Catamarca, in a mountainous district. Population, 3,073.

FUERTE, or **VILLA DEL FUERTE**, a town of Mexico, in the province of Sinaloa, 75 miles north of Sinaloa, on the Rio del Fuerte. It is a place of commercial importance. Population, 5,000.

FUGARA, a name applied to a stop of small scale, in organs, made of wood or metal. In tone it is as piercing as the *gamba*, but much clearer.

FUGITIVE SLAVE LAWS. See **UNITED STATES**, Britannica, Vol. XXIII, pp. 747, 751, 768, 770.

FUGLEMAN, an intelligent soldier placed in front of a line of men at drill to give the time and an example of the motions in the manual and platoon exercises.

FUGUE is the form of musical composition in which all devices of counterpoint, or the art of combining independent ideas in music, find their most fitting use. The laws which govern it are as strict as numerous, and can only be thoroughly understood by an exhaustive study of technical works.

FÜHNEN, the largest of the Danish islands after Seeland, bounded on the west by the Little Belt, on the north by Odensee Fjord, on the east by the Great Belt, and on the south by the island of Langeland. The coast is rugged and much indented with bays, but the interior is generally flat. It is fruitful and well cultivated, producing abundant crops of cereals. Barley, oats, buckwheat, rye, flax, and hemp are grown in large quantities; honey is also largely exported. The Fühnen horses are in great request, and a large number of them are annually sent out of the island. Population, 204,904.

FULAHS, a people of the Soudan, extending from Senegal in the west to Darfur in the east, and from Timbaktu and Haussa in the north to Joruba and Adamawa in the south. Their ethnographic relations are not yet definitely settled, some ally-

ing them with the Soudan negroes, some with the Nuba of the Nile region, and others regarding them as an isolated race. There appear to be two distinct branches, a dark-skinned division, having its center in Bornu and Adamawa, and an olive-skinned division, occurring chiefly in Sokoto. All are strong and well-built, with long hair and regular Caucasian features. They are very intelligent, have a frank, free bearing, are trustworthy, possess considerable self-respect and decision of character, and are devoutly religious. These people are also industrious, their occupations being agricultural, trading, and cattle raising; they also work iron and silver, manufacture articles of wood and leather, and weave various durable fabrics. They probably number from seven to eight millions, and almost all their towns contain mosques and schools.

FULLER, MELVILLE W., born in Augusta, Me., February 11, 1833; graduated at Bowdoin College in 1853. He studied law at Bangor, Me., and at Harvard, and in 1855 began practice in his native city. Here he edited the *Augusta Age*, became president of the common council, and in 1856 city attorney. In the last-named year he removed to Chicago, where, for thirty-two years, he conducted a highly successful law practice. Mr. Fuller was a member of the Illinois Constitutional Convention in 1862, and of the Illinois House of Representatives in 1863. A strong Democrat, he served as a delegate to all the national conventions from 1864 to 1880, inclusive. President Cleveland nominated him chief justice of the United States Supreme Court, April 30, 1888, and he was confirmed by the Senate July 20th, and took the oath of office October 8th, following. He is LL.D. of Bowdoin College and of the Northwestern University.

FULLER, SARAH MARGARET, Marchioness Ossoli (1810-50), an American authoress. For awhile she taught school in Boston, Mass., and Providence, R. I. In Boston the leaders of the transcendental movement were her intimate friends; here she edited *The Dial*, translated from the German, and wrote *Summer on the Lakes* (1843). In 1844 she published *Woman in the Nineteenth Century*, and in the same year she proceeded to New York, on the invitation of Horace Greeley, then editor of the *Tribune*, and contributed to that journal a series of miscellaneous articles. In 1846 she visited Europe, where she met many of the foremost people in the literary, social, political, and reformatory world, and in 1847 married Giovanni Angelo, Marquis Ossoli. She entered with zeal into the Italian struggle for independence in 1849, and her conduct during the siege of Rome by the French was of the most heroic, humane, and tender kind. In May, 1850, with her husband and son, she sailed for America, but the vessel was wrecked off Fire Island Beach, L. I., and all on board perished. Besides many contributions to magazines and papers, she wrote *Summer on the Lakes* (1843); *Woman in the Nineteenth Century* (1844); and *Papers on Literature and Art* (1855).

FULLERTON, the county-seat of Nance county, Neb. It is the seat of Nebraska Wesleyan University. Population (1890), 1,200.

FULLERTON, LADY GEORGIANA, writer of religious novels, daughter of the first Earl Granville, born in Staffordshire, Sept. 23, 1812, died at Bourne-mouth, Jan. 19, 1885. In 1833 she married Alexander Fullerton, and two years afterward published her first story, *Ellen Middleton*. Under the influence of the Tractarian movement she became, in 1844, a convert to Roman Catholicism. The rest of her life was devoted to charitable works and the composition of religious stories, among which

were *Grantley Manor*; *Constance Sherwood*; *A Stormy Life*; *Mrs. Gerald's Niece*; and *Gold-digger and Other Verses*.

FULMINIC ACID has never been isolated in the hydrated form, but its formula doubtless is $C^2N^2H^2O^2$, the hydrogen acting the part of a base. See *Explosives*, Britannica, Vol. VIII, p. 808.

FULNEK, a town of Moravia, ten miles from Neutitschein, with a Capuchin convent, and manufacturing of silk, cloth, and fezes. It was formerly a principal seat of the Moravian brethren, and gave its name to Fulneck in Yorkshire, near Bradford, England, where a Moravian settlement was established in 1748.

FULTON, a town in Fulton township, Whiteside county, Ill., an important railroad junction and the depot of much grain from Wisconsin, Minnesota, and northwestern Illinois. It has a large elevator, carriage, pipe, and stoneware factories, and is the seat of Northern Illinois College.

FULTON, a city of Fulton county, Ky., contains two seminaries, and establishments where cotton-ginning and wool-carding are carried on, and where wagons, tobacco, lumber, and flour are manufactured. Population, 1,818.

FULTON, a city and county-seat of Callaway county, Mo. It contains Westminster College, State asylums for the deaf and dumb, and for the insane, and two State institutions under Presbyterian control. Population (1890), 4,814.

FULTON, a village of Oswego county, N. Y., on Oswego River, 12 miles from Oswego. It has good water-power, several manufactories, and a seminary. Population (1890), 4,214.

FULTON, JOHN, an American P. E. clergyman, born in Scotland in 1834. He emigrated to America in 1858, and took priest's orders in 1858. He has devoted much time to study regarding the canon law, and is one of the ablest canonists in his denomination. He resides in St. Louis. Among his works are *Letters on Christian Unity* (1868); *Index Canonum* (1872); *Laws of Marriage* (1883); and *Documentary History of the Protestant Episcopal Church in the Confederate States*.

FULTONVILLE, a village of Montgomery county, N. Y., on the Mohawk River and Erie Canal, 40 miles west of Albany. It has steam mills, an elevator, a foundry, and machine shops.

FUM, or, more properly, Fung, the Chinese Phoenix, one of the four symbolical animals supposed to preside over the destinies of the Chinese empire. Its appearance indicates an age of universal virtue, the influence of which has extended throughout creation. It is supposed to have the forehead of a goose, hind-quarters of a stag, neck of a snake, fish's tail, fowl's forehead, down of a duck, dragon's marks, the back of a tortoise, face of a swallow, and beak of a cock, with claws and feathers of various colors, red crest and golden beak.

FUMIGATING PASTILS are composed of various ingredients, which, by their smoldering combustion, evolve agreeable odors. They are prepared by taking benzoin and dry balsam of Peru, each 16 parts, sandalwood, 4 parts, labdanum, 1 part, charcoal from limetree wood, 96 parts, nitrate of potash, 2 parts, and mucilage of tragacanth, enough to form the mixture into a paste, from which conical pastils are to be made by a small mold.

FUMIGATION, the cleansing or medicating of the air of an apartment by means of vapors, employed chiefly for the purpose of detaching infectious poisons from clothing and furniture. Most of the methods of fumigation formerly employed have little real value, and are to be looked on chiefly as grateful to the senses; as, for instance,

the burning of frankincense. For the really active processes, see DISINFECTANTS, *Britannica*, Vol. VII, p. 258.

FUNDI, a light and nutritious grain raised in West Africa, highly esteemed as food for invalids.

FUNDY, BAY OF, an arm of the Atlantic, separating Nova Scotia from New Brunswick, and branching at its head into two inlets, Chignecto Bay and Minas Basin, which are separated by narrow necks of land from the Gulf of St. Lawrence. It has an extreme breadth of 45 miles and a length up to Chignecto Bay of 140 miles; it receives the St. John, the principal river of New Brunswick, and the St. Croix, which separates that province from Maine. The navigation is rendered perilous by the tides, which rush in with impetuous force, rising rapidly from 60 to 70 feet.

FÜNEN, or **FÜHNEN** (Dan. *Fyen*), the largest of the Danish islands after Zealand, is separated from Sleswick and Jutland on the W. by the Little Belt, and from Zealand on the E. by the Great Belt. With the islands of Langeland, Årø, Taasinge, etc., it forms the two administrative districts of Odense and Svendborg. Area of Fünen, 1,135 square miles; population (1893), 206,528.

FUNSTON, EDWARD H., member of Congress from the second district of Kansas, was born in Clarke county, Ohio, in 1836. Educated in the common schools, New Carlisle Academy and Marietta College, he entered the army in 1861 as lieutenant in the sixteenth Ohio battery. Mustered out in 1865, he located in Kansas, and was member of the Kansas house of representatives 1873-75, of which he was speaker in 1875. He was elected State senator in 1880 and was made president *pro tempore* of the senate. He has been a member of Congress since 1882.

FURFURAMIDE, **FURFURINE**, and **FURFUROL**. When starch, sugar or bran is acted upon by dilute sulphuric acid and peroxide of manganese, the distillate contains not only formic acid, but also a small quantity of an essential oil, which, after being purified by redistillation, is colorless, has a fragrant odor somewhat resembling that of bitter almonds, and when dissolved in cold sulphuric acid forms a beautiful purple liquid. This oil is termed *furfurol*. If *furfurol* be treated with ammonia, it is converted into *furfuramide*, which occurs in colorless crystals, insoluble in water, but soluble in alcohol. If *furfuramide* is boiled with a solution of potash, it dissolves, its elements assume a new arrangement, and the solution on cooling deposits long silky needles of a powerfully alkaline base, *furfurine*, which is isomeric with *furfuramide*. It is dissolved by dilute acids, and on adding ammonia to these solutions the alkaloid is precipitated unchanged.

FURNEAUX ISLANDS, a group of islands in Bass's Strait. They are numerous, the largest being 35 miles in length, 10 miles in breadth. The soil is sandy and the vegetation feeble.

FURNES, a small town of Belgium, near Dunkirk. Four important lines of canal meet at this town, and it has tanneries and linen manufactures, as well as a considerable trade in horses, cattle, hops and cheese. Population, 5,322.

FURNES, HORACE HOWARD, an American author born in 1833. He graduated at Harvard in 1854, traveled three years in Europe, and in 1859 was admitted to the Pennsylvania bar. He has been a diligent student of Shakespeare, and undertook the editing of a new *variorum* edition, several volumes of which have been issued.

FURNES, WILLIAM HENRY, an American Congregational Unitarian clergyman, born in 1802. In 1825 he was ordained to the first C. U. church in Philadelphia, Pa., where he remained until 1875,

when he retired from the ministry. From 1845 to 1847 he edited an annual called "The Diadem." He translated from the German several noted works.

FURNISS, HARRY, a caricature artist, was born March, 1854, at Wexford, Ireland, of English parents. He was educated in Dublin, and began drawing for periodicals and magazines at a very early age. Mr. Furniss went to London at the age of nineteen, and has ever since been constantly engaged in illustrating. For many years he was a regular contributor to the *Illustrated London News*, mostly depicting the lighter side of every-day life, but occasionally acting as a serious "special" for that paper. In the latter capacity he made a sketching tour of the distressed parts of England in the winter of 1878, and has followed political campaigns through the country, etc. His first drawing in *Punch* appeared in 1880, and he joined the regular staff four years after; at this time his *Punch* Parliamentary Views were collected and published in an *édition de luxe*. His principal works in *Punch* are Parliamentary Scenes and Sketches of Members, with few exceptions drawn direct in the houses and finished in the studio. Besides his work in *Punch* he has illustrated the following works published from the same office: F. C. Burnand's *Happy Thoughts*; A'Beckett's *Comic Blackstone*, colored plates, and Burnand's *Incomplete Angler*. He has contributed drawings to nearly all the chief magazines in London, Harper's in America, and others, and to numerous papers, the *World* and *Vanity Fair* among them. He has also brought out books for children, with colored pictures, entitled "Roms." In 1890 he was elected a Fellow of the Institute of Journalists.

FURNITURE, the name applied to an organ-stop, or register, consisting of two or more ranks of pipes to each note.

FURNIVALL, FREDERICK JAMES, M.A., Ph.D., born Feb. 4, 1825, at Egham, in Surrey, received his education at private schools at Englefield Green, Turnham Green and Hanwell, at University College, London (1841-42), and Trinity Hall, Cambridge, B.A. 1846, M.A. 1849. He was called to the bar in 1849, but has devoted his life mainly to the study of Early and Middle English Literature, and has established numerous societies of which he is director for promoting the study of special works: the Early English Text, 1864; the Chaucer, 1868; the Ballad, 1868; the New Shakespeare, 1873; the Wyclif, 1882; the Browning, 1881; and the Shelley, 1885. Through his societies Dr. Furnivall has raised and expended over £40,000 in printing early MSS. and rare books. He was also one of the founders of the Working Men's College, and taught there for many years besides being a captain in its volunteer corps and president of its boat club. He was one of the first builders of narrow waver-boats (1845), and introduced sculls instead of oars into fours and eights. Dr. Furnivall has edited a large number of early English and other works, among which may be mentioned Walter Map's *Queste del Saint Graal*; Percy's *Folio MS. of Ballads and Romances*; *The Babes Book*; Harrison's *England*, 1577-87; Caxton's *Book of Curtesye*; a Six-Text print of Chaucer's *Canterbury Tales*—a very valuable aid to the study of Chaucer—and parallel-text editions of the poet's *Minor Poems* and *Troilus and Cressida*, etc. To these may be added several of the Shakespeare quartos in fac-simile, and the introduction to a one-volume edition of the works, called *The Leopold Shakespeare*.

FURY AND HECLA STRAIT, in 70° N. lat., separates Melville Peninsula from Cockburn Island, and connects Fox Channel with the Gulf of Boothia. It was discovered by Parry in 1822, and named after his ships.

FUSAN, one of the three open ports of Corea, on the southeast shore of the peninsula, and practically a Japanese settlement, under a treaty of 1876. The trade is almost entirely in Japanese hands, and in 1888, of 2,614 foreigners, the Japanese numbered 2,595. The imports in 1887 (chiefly Manchester goods, salt, and Japanese wares) were valued at \$659,000, the exports (rice, beans, hides, etc.), excluding specie, at \$394,000. There are good custom stores, and regular communication by steamers with Shanghai, Nagasaki, and Vladivostok, and by telegraph with Seoul.

FUSARA, LAKE OF, a small lake of Italy, eleven miles west of Naples, called by the Romans *Acherusia Palus*. It is near the site of the ancient Cumæ, and during the Roman empire its banks were studded with villas. Numerous remains of massive buildings, houses, and tombs are still to be seen in the neighborhood. The water of the lake is brackish. Oysters have been cultivated here since the time of the Romans.

FUSILIERS, formerly soldiers armed with a lighter fusil or musket than the rest of the army; but at present all regiments of foot carry the same pattern of rifle. Fusilier is, therefore, simply an historical title borne by a few regiments of the British army.

FUSTEL DE COULANGES, NUMA DENIS, born at Paris, March 18, 1830, died Sept. 12, 1889. After filling several chairs successively at Amiens, Paris, and Strasburg, he was transferred in 1875 to the École Normale at Paris, and became a member of the Institute in the same year. His earlier writings, *Mémoire sur L'île de Chio* (1857), and *Polybe, où la Grèce conquise par les Romains* (1858), had hardly prepared the reading public for the altogether exceptional importance of his brilliant book, *La Cité Antique* (1864; 10th ed. 1885), which threw a flood of fresh light on the social and religious institutions of antiquity. The work was crowned by the French Academy, as was also his profoundly learned and luminous *Histoire des Institutions Politiques de l'Ancienne France* (Vol. I, 1875).

FUSUS, a genus of gasteropodous mollusks nearly allied to *Murex*, having a spindle-shaped shell with a very elevated spire, the first whorl

often much dilated, and a straight elongated canal. The whorls are not crossed by varices, as in *Murex*. About 100 existing species have been described, and more than three times that number of fossil ones.

FUTAK, a town of lower Hungary, in the county of the Lower Bacs, situated on the left bank of the Danube. It has a beautiful castle and garden. It produces great quantities of vegetables and tobacco, and has an extensive trade in corn. Population, 7,900.

FUTTUHA, or Futwa, a town of India, in the district of Patna, and sub-presidency of Bengal, stands at the confluence of the Punpun and the Ganges. As the Ganges is here deemed peculiarly sacred, Futtuha is, at certain seasons of the year, the resort of vast numbers of pilgrims. Population, 11,295.

FUTTYGURH, a military cantonment of Furrackabad, about three miles to the east of that city, on the left bank of the Ganges, being in latitude 27° 22' north, and longitude 79° 41' east. Population, 10,335.

FUTURE STATE, the condition of the future life, which will continue forever. A belief in immortality has been held in connection with a belief in God by all nations in every age of the world. The traditions of the most civilized nations favor the belief that it originated in divine revelation, while its universality would seem to show that it has its foundation in the innate sentiments of our nature. For what Christian speculation has concluded about a future state, see ESCHATOLOGY, *Britannica*, Vol. VIII, pp. 535-538.

FYAN, ROBERT W., a lawyer, born in Bedford county, Pa., March 11, 1835, and removed to Marshfield, Mo., in 1858. He was an officer in the Confederate army during the war of the Rebellion; was circuit attorney of the Fourteenth Judicial Circuit in 1865 and 1866, and judge of the same circuit from April, 1866, to January, 1883, when he resigned. In politics a Democrat, he was a member of the Missouri Constitutional Convention of 1875; was elected a Representative from the Fourteenth Congressional District of Missouri to the 48th Congress, and in 1890 was elected from the same district to the 52d Congress. He was reelected in 1892.

G

GABBRO—GAGERN

GABBRO, a rock consisting essentially of the two minerals plagioclase feldspar and diallage. It shows a thoroughly crystalline granitoid texture, with no trace of any base. The plagioclase is a basic variety—labradorite being commonest; but anorthite is also sometimes present in abundance. The diallage may usually be noted by the pearly or metalloid luster on its cleavage planes. It is usually also brownish or dirty-green in color. Olivine is also often a constituent of gabbro, and some apatite is almost invariably present. In certain kinds of gabbro other varieties of pyroxene appear; and among other minerals which occasionally occur in gabbro may be mentioned hornblende, magnesia, mica, magnetite, ilmenite, quartz. The rock is of igneous origin, and occurs in association with the crystalline schists as large amorphous masses or bosses. Sometimes it appears in the form of thick sheets and bosses, associated with volcanic eruptive rocks.

GABELLE: in France, a word sometimes used to designate every kind of indirect tax, but especially the tax upon salt. This impost, levied in 1286 by Philippe IV, was meant to be only temporary, but was declared perpetual by Charles V. It was unpopular from the first, and the attempt to collect it occasioned frequent disturbances. It was finally suppressed in 1789. The word gabelle also indicated the magazine in which salt was stored.

GABERLUNZIE, an old Scotch term for a beggar.

GABORIAU, ÉMILE, the great master of "police novels," born at Saujon in Charente-Inférieure, in 1835, died Sept. 28, 1873. He had been a contributor to some of the smaller Parisian papers, when he leaped suddenly into fame with his story, *L'Affaire Lerouge* (1866) in the feuilleton to *Le Pays*. This was quickly followed by other works of note.

GABRIEL CHANNEL, between Tierra del Fuego and Dawson's Island, is about 25 miles in length, and varies in width from two to three miles at the extremities to half a mile midway. The shores are abrupt masses of rock rising to the height of 1,500 feet. The channel is subject to violent whirlwinds.

GACHARD, LOUIS PROSPER, writer on the history of Belgium, born at Paris, March 12, 1800, died Dec. 24, 1885. He spent the greater part of his life as keeper of the archives at Brussels. He edited from the national archives of Belgium and Spain the correspondence of William the Silent, Philip II, Margaret of Austria, and Alba, and wrote *Les Troubles de Gand sous Charles V.* and *Retraite et Mort de Charles V.*, besides other books dealing with the history of Belgium.

GADE, NIELS WILHELM, musical composer, born at Copenhagen, Feb. 22, 1817. He became known by his *Echoes of Ossian*, studied at Leipzig, and was Mendelssohn's successor as leader of the Gewandhaus concerts. In 1868 he was appointed master of the Chapel Royal at Copenhagen. He has composed symphonies, an octet, the *Erl King's Daughter*, and other works. Gade died in 1890.

GADFLY, an insect of the genus *Cestrus*, which stings cattle and horses, and deposits its eggs in their skin, one in a place, which, hatching, live on the integument under the skin until fitted to emerge. The maggot then drops to the ground,

where it burrows, and undergoes its transformation to the perfect fly. The ovipositor of the female is formed of a horny substance, and consists of four telescopic tubes, of which the last terminates in hooked joints. In depositing her egg the fly does not remain longer than a few seconds on the animal's back. The cattle are said to exhibit alarm and excitement at the presence of a gadfly. About twenty species are known in the United States, some native, and some imported with our domesticated animals. See *Britannica*, Vol. VII, p. 256.

GADSDEN, the county-seat of Etowah county, Ala., on the Coosa River. Yellow-pine lumber is here manufactured, and in the vicinity coal and iron are found. Population (1890), 2,901.

GADSDEN, CHRISTOPHER (1724-1805), an American patriot. He received his education in England; from 1741 to 1745 he was a clerk in a counting-house in Philadelphia, and then made a second visit to England. After his return to America he engaged in business on his own account, and accumulated a small fortune. In 1765 he was a delegate to the first Colonial Congress, and in 1774 to the first Continental Congress. At the beginning of the Revolutionary war he entered the army as a colonel, and in September, 1776, was promoted to the rank of brigadier-general. For a time he was lieutenant-governor of South Carolina, and was a framer of the State constitution. He signed the capitulation when Charleston was taken by Sir Henry Clinton in 1780, and, refusing a parole, was imprisoned for forty-two weeks. In 1782 he was elected governor of South Carolina, but declined the office on account of his age.

GADSDEN, JAMES (1788-1858), a United States statesman. He served in the war of 1812 as lieutenant-colonel of engineers, and later was Jackson's aid in the expedition to examine the military defenses of the Gulf of Mexico and the southwestern frontier. In 1818 he served in the Seminole campaign. In 1822 he retired from the army, and settled in Florida as a planter. In 1824 he became a member of the territorial council; was a commissioner to remove the Seminoles from northern to southern Florida, and in 1853 was made minister to Mexico. He shortly after retired to private life.

GADSDEN PURCHASE, a name given to that portion of New Mexico and Arizona which was purchased from Mexico by Gen. James Gadsden for the United States, Dec. 30, 1853. The Government paid \$10,000,000 for the territory, which comprised an area of 45,535 square miles.

GAGE, MATILDA JOSLYN, an American reformer, born in 1826. From 1852 to 1861 she spoke on reform measures, and advocated the abolition of slavery. From 1878 to 1881 she edited the *Syracuse, N. Y., "National Citizen"*, and is the author of *Woman As An Inventor* (1870). With Susan B. Anthony and Elizabeth Cady Stanton she compiled the *History of Woman Suffrage* (1881-86).

GAGERN, HEINRICH WILHELM AUGUST, FREIHERR VON (1799-1880), a German statesman, born at Baireuth, Aug. 20, 1799. He was one of the founders of the student movement of 1815-19. After holding office under the government of Hesse-Darmstadt down to 1848, he became in that

year one of the leading politicians of the Frankfurt parliament, of which he was elected president. In 1849 he resigned his position, and shortly after retired to private life. Pensioned off in 1872, he died at Darmstadt, May 22, 1880.

GAINES, EDMUND PENDLETON (1777-1849), an American soldier. He entered the army in 1799; became major, then colonel, and in 1814 brigadier-general. The same year he was brevetted major-general for gallant conduct at Fort Erie, where he was severely wounded. He also received the thanks of Congress, with a gold medal. He was afterwards active against the Seminoles in Florida, and in 1836 conducted an expedition against Osceola, in which he was again severely wounded.

GAINES, MYRA CLARK (1805-85), an American heiress, wife of Gen. E. P. Gaines. She is known through the extraordinary lawsuit with which her name was associated, and through which she became heir to her father, Daniel Clark, whose fortune was estimated at \$35,000,000. Clark died in 1813, and his estate was disposed of under the provisions of a will dated 1811. Some time afterward, however, witnesses were found who had seen and read a will, dated 1813, which left the entire fortune to Myra; and in 1856, although this will was never discovered, the Supreme Court of Louisiana decided that the missing will should be received as the last will of Daniel Clark. Only a small portion of the original fortune, however, came into the possession of the claimant, the rest having been swallowed up in the legal proceedings that preceded the final victory.

GAINESVILLE, a health resort of Florida, and the county-seat of Alachua county. It contains a State normal school. Population, 2,790.

GAINESVILLE, the county-seat of Hall county, Ga., situated on the summit of the Chattahoochee ridge that divides the waters of the Gulf and the Atlantic. It has mills, machine shops, car shops, a college; and its fine springs, which are chalybeate, limestone, and freestone, make it a health resort. Population, 3,202.

GAINESVILLE, the county-seat of Cooke county, Texas, eight miles south of Red River. It contains educational institutions, and the chief business of the people is stock-raising and farming. Pop. 6,594.

GAIRDNER, JAMES, historian, born at Edinburgh, March 22, 1828; attended lectures in the University there, and at 18, as a clerk, entered the Public Record office in London, where he became assistant keeper in 1859. He has distinguished himself by the rare combination of profound erudition, patient accuracy, and judicial temper which he has shown in the editing of a long series of historical documents.

GAIRDNER, WILLIAM TENNANT, a distinguished physician, born in 1824. He graduated M. D. at Edinburgh in 1845, becoming fellow of the Royal College of Physicians there in 1850, and afterward LL. D. of Edinburgh, and M. D. of Trinity College, Dublin. He was appointed by the crown in 1862 to the chair of practice of medicine in Glasgow University; was president of the medical association there in 1888, and is physician in ordinary to the Queen for Scotland. He has contributed many valuable papers to medical journals.

GAIRLOCH, an inlet of the sea on the West coast of Ross-shire, six miles in length, which gives name to a parish and village.

GAISFORD, THOMAS, D. D. (1780-1855), a distinguished classical scholar, born at Ilford, Wilts, in 1780, graduated at Christ Church, Oxford, in 1804, and in 1811 was appointed regius professor of Greek at Oxford. From 1819 to 1847 he was rector of Westwell, Oxfordshire. In 1831 he became dean of

Christ Church. He died in 1855, and in his memory a Greek prize was founded at Oxford.

GALATONE, a very ancient town in the south of Italy, in the province of Lecce, about nine miles northeast of Gallipoli, situated in a very rich but insalubrious plain. Population, 5,559.

GALA WATER, a stream of Edinburgh, Selkirk, and Roxburgh shires, Scotland, rising among the Moorfoot Hills, and winding 21 miles south-southeast past Stow and Galashiels, where, after a total descent of 800 feet, it falls into the Tweed, a little below Abbotsford, and $2\frac{1}{2}$ miles west of Melrose. In its valley, the ancient Wedale, Skene localizes one of Arthur's battles.

GALAXY, or the MILKY-WAY, the great luminous band which nightly stretches across the heavens from horizon to horizon, and which forms a zone very irregular in outline, but completely encircling the whole sphere almost in a great circle, inclined at an angle of 63° to the equinoctial. At one part of its course it opens up into two branches, one faint and interrupted, the other bright and continuous, which do not reunite till after remaining distinct for about 150° . Its luminosity is due to innumerable multitudes of stars, so distant as to be blended in appearance, and only distinguishable by powerful telescopes.

GALE, or SWEET GALE, a species kindred to the North American candleberry, and widely distributed through the peaty uplands of the Northern hemisphere. Its leaves and berries are dotted with resinous oil-drops, which have a most agreeable fragrance, and formerly gave it a most extensive range of uses in the domestic economy.

GALENA, a city and the county-seat of Jo Daviess county, Ill., situated on the Fevre River, six miles from its entrance into the Mississippi. By railroad it is 19 miles east-southeast of Dubuque, and 133 miles west-northwest of Chicago. Steamboats can ascend the river to Galena, which is about 100 miles by water above Davenport, Iowa. The principal exports are lead (mined and smelted in the vicinity), zinc, dairy products, and grain. Population in 1890, 5,635.

GALERITES, a genus of fossil sea urchins, peculiar to and abundant in the Cretaceous system. The generic name, as well as that popularly given to them in the districts where they abound, viz., "Sugarloaves", is descriptive of the conical shape of their shell. The body in breadth is nearly circular or polygonal. The under surface is entirely flat, and has the mouth placed in its center, with the vent near the margin. There are five avenues of pores reaching from the mouth to the summit. The fossils are often found silicified.

GALES, JOSEPH (1760-1841), an American journalist. He published the "Register" in Sheffield, England, for several years, and in 1793 sold his journal and came to the United States. He then edited the Philadelphia "Independent Gazetteer," till 1799, when he removed to Raleigh, N. C., and founded the "Register," which he continued to publish until he reached an advanced age. He then became interested in African colonization, and was an active member of the American colonization society until his death.

GALES, JOSEPH (1786-1860), son of the preceding, also an American journalist. In 1807 he became connected with the Washington "National Intelligencer," and in 1810 succeeded to the sole proprietorship. In 1812 he formed a partnership with William Winston Seaton, and in 1813 the "Intelligencer," which had previously been a tri-weekly paper, became a daily. Mr. Gales continued his connections with this journal until his death.

GALESBURG, a city of Knox county, Ill., 53 miles west-northwest of Peoria, 164 miles west-southwest of Chicago, 43 miles east by north of Burlington, Iowa, and 99 miles northeast of Quincy. Galesburg is directly connected with all these cities by railroad. It is surrounded by fertile prairies, and is noted for its educational institutions. It has several foundries and machine shops, and manufactories of brooms, corn planters, carriages, etc. Population in 1890, 15,264. See *Britannica*, Vol. X, p. 24.

GALESVILLE, the county-seat of Trempealeau county, Wis., on Beaver Creek. It has a university, a flour mill, stove works, and a barrel factory.

GALIGNANI, JOHN ANTHONY (1796-1873), and WILLIAM (1798-1882), Parisian publishers, born in London, the former Oct. 13, 1796, the latter March 10, 1798. They published the "Messenger," and made it an important medium for advocating cordiality between England and France. They founded at Corbeil, near Paris, a hospital for distressed Englishmen; and in 1839 the Galignani Home, for decrepit members of the printing and bookselling trades, was opened at Neuilly. The elder died Dec. 30, 1873, and the younger Dec. 12, 1882.

GALLILEE, the name applied to a porch or chapel attached to a church, in which penitents stood, processions were formed, and corpses deposited for a time previous to interment. In some religious houses the galilee was the only part of the church accessible to women. A portion of the nave was sometimes marked off by a step, or by a line of blue marble, to mark the boundary to which women were limited.

GALION, a city of Crawford county, Ohio, 64 miles north of Columbus. It has railroad shops, foundries, and a population (1890) of 6,326.

GALLAGHER, WILLIAM DAVIS, an American poet and journalist, born in 1808. In 1830 he became editor of the Xenia, Ohio, "Backwoodsman," in 1831 of the Cincinnati "Mirror," in 1836 of the Cincinnati "Western Literary Journal and Monthly Review," in 1838 of the "Hesperian," a Monthly Miscellany of General Literature, and at the same time was manager of the Columbus, Ohio, "State Journal," and from 1839 to 1850 was connected with the Cincinnati "Gazette." In the latter year he became the confidential clerk of Thomas Corwin, Secretary of the United States Treasury, and during the civil war was again employed in the Treasury department. At the close of the war he retired to Louisville, and has since been a resident of that neighborhood. For a few years from 1854, Mr. Gallagher was an editor of the Louisville "Daily Courier." He published three volumes of poems under the name of Erato (1835-37), and also *Selections from the Poetical Literature of the West* (1841), and *Miami Woods; a Golden Wedding and Other Poems* (1881).

GALLAIT, LOUIS, a Belgian historical painter, born at Tournay in 1812, has become famous by pictures on subjects from the history of the Low Countries, such as "The Abdication of Charles V." (1841), "Alva viewing the dead bodies of Egmont and Horn" (1851), and "The Plague of Tournay" (1882), which last the Brussels Museum purchased for £4,800.

GALLA OX, or **SANGA**, a remarkable variety of ox inhabiting Abyssinia. The chief peculiarity of this animal is the extraordinary size of the horns, which rise from the forehead with an outward and then an inward curve, producing a figure of a lyre, and finally curve a little outward at the tip, to which they taper gradually.

GALLATIN, the county-seat of Daviess county, Mo., on Grand River. It is a railroad junction, and is 76 miles northeast of Kansas City. Pop., 1,489.

GALLATIN, the county-seat of Sumner county, Tenn., 26 miles northeast of Nashville, and three miles from Cumberland River. It contains cotton, woolen and carriage factories, flour mills, a foundry and an establishment for the manufacture of agricultural implements. Population, 2,078.

GALLATIN, MOUNT, a mountain of the National Park, Wyoming, 10,000 feet high. Gallatin River and the east fork of Madison River rise near its base.

GALLATIN RIVER rises in the National Park, flows northward through Montana, and, after a course of 125 miles, unites with the Jefferson to form the Missouri River.

GALLAUDET, EDWARD MINER, an American educator, son of Thomas H., born in 1837. In 1856 he became a teacher in the Hartford asylum for deaf-mutes, and in 1857 organized the Columbian institution for the deaf, dumb and blind at Washington, D. C., becoming its principal the same year. In 1864 he was made president of the National Deaf-mute College, and the following year professor of moral and political science. In 1880 he attended the international congress of instructors of deaf-mutes, held at Milan, Italy, and in 1883 was president of the convention of American instructors at Jacksonville, Ill. In 1886 he visited England on the invitation of the British government, and gave the royal commission on the education of the deaf, dumb, and blind information regarding the system pursued by the United States. He is the author of a popular *Manual of International Law* (1879).

GALLAUDET, THOMAS, an American clergyman, son of Thomas H., born in 1822. In 1850 he was ordained deacon of the Protestant Episcopal church, and the following year became priest. In 1852 he founded St. Ann's church for deaf-mutes in New York city. He has contributed to the *American Annals of the Deaf and Dumb*, and to other periodicals.

GALLAUDET, THOMAS HOPKINS (1787-1851), an American educator. He studied theology at Andover, and was licensed to preach in 1814, but, after studying the methods in use at the establishments in Europe for teaching the deaf and dumb, devoted himself to the education of that class in the United States. He founded the first American institution for deaf-mutes, at Hartford, Conn., and was its president from 1817 to 1830, when he resigned because of impaired health. In 1838 he became chaplain of the Connecticut insane asylum. Among his works are: *Sermons Preached to An English Congregation in Paris*; *Bible Stories for the Young*; *Child's Book of the Soul*; and *Youth's Book of Natural Theology*. He edited also *American Annals of the Deaf and Dumb*. See **DEAF AND DUMB**, *Britannica*, Vol. VII, p. 11.

GALLE, JOHANN GOTTFRIED, a German astronomer born at Pabsthaus in 1812. He studied at the Universities of Wittenberg and Berlin, and afterwards became a teacher at Guben and in Berlin. In 1835 he was made an assistant in the newly founded observatory in Berlin. Here he enjoyed the instruction of the celebrated astronomer Encke. At the end of 1839 Galle discovered three new comets, for which he was awarded the Lalande prize. On Sept. 23, 1846, Galle received a letter from the French astronomer Leverrier, requesting him to examine a certain part of the sky for an unknown planet, and that very evening he discovered the planet Neptune. This discovery marks an era in the history of astronomy. Galle continued to make further discoveries, and since 1851 he has been professor of astronomy and director of the observatory at Breslau. He has published a number of articles

on astronomy in several scientific journals, but especially in the "Astronomische Nachrichten."

GALLEASS, a sort of galley formerly used in the Mediterranean. The galleass was larger than an ordinary galley, carried generally three masts and about 20 guns, and was rowed by galley-slaves, sometimes as many as 300 being employed in rowing one vessel.

GALLENGA, ANTONIO CARLO, born at Parma, Italy, but of a noted Piedmontese family, November 4, 1810; educated at the university of that city, took part in the political outbreaks there in 1831; went to France, the United States, and other countries, and naturalized in England in 1849. He wrote for the *London Times*, and is the author of numerous historical works. From 1854 to 1864 he sat in the Piedmontese and Italian parliaments.

GALLEON, a large ship formerly used by the Spaniards to carry home the gold, silver, and other wealth contributed by the Mexicans and South American colonies. Galleons were armed, and had usually three or four decks, with bulwarks three or four feet thick, and stem and stern built up high like castles. They were large clumsy structures, and the easy prey of pirates and hostile navies.

GALLIFET, GASTON ALEXANDRE, MARQUIS DE, born at Paris, January 23, 1830; entered the French army in 1848; commanded a regiment in Africa, and became general of brigade in the army of the Rhine 1870-71. During the second siege of Paris he commanded a brigade of the Versailles troops and won unenviable notoriety by his merciless severity in dealing with the Communist prisoners. Notwithstanding this fact he was promoted to high command on the reorganization of the army under Gambetta. In 1875, having meantime won distinction in Africa, he was made a general of division. He is a commander of the Legion of Honor and ranks high as a cavalry officer.

GALLINGER, JACOB H., United States Senator from New Hampshire, a physician, born in Cornwall, Ont., March 28, 1837. He received an academic education; was a printer, and became a physician in 1858. In politics he was a Republican; he was a member of the State house of representatives in 1872 and 1873; a delegate to the New Hampshire Constitutional convention of 1876, a State Senator, 1878-80, being president of the Senate in 1879-80. He was surgeon-general of New Hampshire for two years. He received the honorary degree of A. M. from Dartmouth College. He was a representative in the 49th and 50th Congresses; in 1891 was elected by the New Hampshire legislature to the United States Senate to succeed Henry W. Blair.

GALL-INSECTS, those which deposit their eggs in the tissue of plants, and which live within abnormal growths or excrescences produced on plants either by the action of the tenant of the excrescence, or that of its parent. The most common gall-producers belong to two of the seven orders of true insects, *Hymenoptera* and *Diptera*. See *INSECTS*, *Britannica*, Vol. XIII, p. 148-52.

GALLIPOLIS, a city and county-seat of Gallia county, Ohio, on the Ohio River, midway between Cincinnati and Pittsburgh. It has a line of packet-boats between these cities. The city contains foundries, woolen mills, furniture factories, and planing-mills. Population 4,498.

GALLIOT, a Dutch vessel carrying a main and a mizzen-mast, and a large gaff-mainsail. Galliot of 400 to 500 tons burden were formerly used as bomb-vessels.

GALLITZIN, DEMETRIUS AUGUSTINE (1770-1841). a Russian nobleman, and an American missionary.

In 1796 he was ordained a priest of the Roman Catholic church, and after traveling through various States of the Union as a missionary he settled in Cambria county, Pa., and purchased a large tract of land to be given to Roman Catholic families. He named his colony Loretto, and through his efforts the wilderness in which he settled was transformed into a thrifty community.

GALLIVATS, large row-boats, formerly, and still to some degree, used in eastern waters. They rarely exceed seventy tons, carrying two masts with high triangular sails. The Malay pirates employ these swift but somewhat fragile vessels.

GALLOWAY, MULL OF, bold headland of precipitous rock, the southern extremity of the peninsula called the Rhinns of Galloway, in Wigtownshire, and the most southern point of Scotland. It is $1\frac{1}{4}$ mile long, and $\frac{1}{4}$ of a mile broad, and rises to a height of 210 feet at its eastern extremity, on which stands a lighthouse 60 feet high.

GALT, SIR ALEXANDER TILLOCH, a Canadian statesman, born in Chelsea, Sept. 6, 1817, and at an early age emigrated from England to Canada. In 1833 he became a clerk of the British and American Land Company, and from 1844 to 1856 was sole manager of the company's estates. In 1849 Mr. Galt was elected a member of the Canadian Parliament from Sherbrooke, and from 1853 continued to occupy the same position till 1872, when he resigned. In 1858-62, in 1864-66, in 1867, and in 1869, he was minister of finance. In 1875 he was appointed a commissioner for Great Britain under the Treaty of Washington of 1871, and more recently he acted as a member of the Halifax Fisheries Commission. From 1880 to 1883 he was High Commissioner for Canada in England; in 1881 was Delegate for Canada at the Paris International Monetary Conference, and in 1883 was a member of the Executive and General Committees of the International Fisheries Exhibition. He declined the honor of C.B. (Civil) in 1867, but in 1869 was created a K.C.M.G., and in 1878 was made a G.C.M.G. The degree of LL.D., was conferred upon him by Edinburgh University. He is the author of *Canada from 1849 to 1869*, and of several pamphlets.

GALT, SIR THOMAS, brother of the foregoing, was born in England in 1815; removed to Canada in 1828; and was called to the bar in 1845. In 1858 he became queen's counsel, in 1869 judge of the common pleas, and afterward chief justice. He was knighted in 1888.

GALTON, FRANCIS, F.R.S., explorer and author, born at Duddleston, England, in 1822, is a grandson of Erasmus Darwin. He was educated in Birmingham and London, and graduated from Trinity College, Cambridge, in 1844. In 1846 he traveled in North Africa, and in 1850 explored lands in South Africa; his published accounts of his experiences procuring him the gold medal of the Royal Geographical Society. Mr. Galton is author of *Meteorographica*, 1863, the first attempt to chart the progress of the elements of the weather, on a large scale, and through which the existence and theory of anti-cyclones was first established. In later years he has published the following works, bearing more or less directly on heredity and on the measurement of the various faculties:—*Hereditary Genius, its Laws and Consequences*, 1869; *English Men of Science; Their Nature and Nurture*, 1874; *Inquiries into Human Faculty and its Development*, 1883; *Natural Inheritance*, 1889; also several memoirs on anthropometric subjects and on new statistical processes applicable to anthropometry, including that of composite portraiture.

GAULT, **GALT**, or **GOLT**, a subdivision of the Cretaceous system, is a stiff, bluish-gray clay,

which here and there contains indurated nodules and septaria.

GALVA, a city of Henry county, Ill., 45 miles southeast of Rock Island, on the ridge dividing the Illinois and Mississippi River basin. It is located in a rich coal region. Population (1890), 2,409.

GALVESTON, a city and port of entry of Texas, on the south side of the entrance into Galveston Bay. It is the principal port and the largest city in the State, with a population in 1890 of 29,084. See Britannica, Vol. X, p. 53.

GAMBETTA, Léon, the great French Republican leader to whose efforts was greatly due the rehabilitation of France after the war of 1870-71, was born in Cahors, a small city of the south of France, April 3, 1838. His father was a small trader of Italian extraction, the family originally coming from Genoa. Young Gambetta obtained an ordinary education at a provincial school and college, and in 1858 went to Paris to study law. Baptized and confirmed in the Roman Catholic faith, he practically abandoned all church communion before reaching manhood and became a materialist and a persistent opponent of clericalism. His life in Paris during the years which immediately followed his admission to the bar was one of struggles and poverty. The Napoleonic system denied anything in the nature of advancement to liberal advocates or barristers, and Gambetta had already become known by his fiery denunciations of the sham Caesarism of "Napoleon le Petit." But in 1868 his opportunity came. In that year some of the radical Parisian journals opened a subscription for a monument to the memory of Baudin, the deputy who was murdered during the *coup d'état*. Gambetta appeared for the defense of the veteran Delécluze and against him were arrayed the best forensic talent the government could command. The fiery Southerner's speech in denunciation of the men and methods of December woke a responsive echo in the hearts of the people and proclaimed the moral rottenness of the Second Empire in all its shame.

In the following year Gambetta contested seats in the chamber at both Paris and Marseilles, and being elected at both chose to sit for Paris. In July, 1870, came the declaration of war against Germany, followed swiftly by tidings of repeated disasters from the front. The democratic leader sought vainly to elicit the truth from the ministry, which tried to delude the people with optimistic reports. Earlier than any of his associates he pressed upon the ministry the necessity of arming the national guard and of facing the crisis so rapidly approaching. On the morning of Sunday, September 4, 1870, the overwhelming news of the surrender at Sedan reached Paris, and the Napoleonic dynasty was swept away by the force of an indignant people. Gambetta entered the ministry, which was constituted at the Hôtel de Ville by popular acclamation. He was made minister of the interior in the provisional government, which became the government of the national defense.

His first act was to issue a call for the convocation of the National Assembly on September 8th, but meantime the Prussians were pressing toward Paris, and this could not be held. As the invading army drew its cordons around the city, cutting off the government from all communications with the armies still in the field, it became imperative that some member of the government must leave Paris. The only possible method of escape was by balloon, and early in October Gambetta thus left the city, reaching Tours in safety. As the representative of the government outside Paris he became practically the dictator of France. He formed the

nucleus of a government and issued a proclamation calling upon the people to rise and repel the invader. France responded heroically, and there is no parallel in history to the gigantic efforts made by Gambetta to organize the undisciplined patriotism of the country into an army. It looked for a few brief weeks as if the army of the Loire might have succeeded in stopping the Germans, but Bazaine's treasonable surrender of Metz blasted all hopes, and the raw levies of Faidherbe, Chanzy and d'Aurelles de Paladine melted away before the trained organization of the Germans. Even when starving Paris capitulated in January, 1871, the tireless organizer declared his intention of carrying on the war *d'outrance*, but his proclamation to this effect was nullified February 4th by his colleagues in the capital, and he resigned his position. Four days later ten departments elected him to the National Assembly, which met at Bordeaux to approve the terms of peace preliminarily arranged by Jules Favre. Gambetta chose to sit for the department of Bas-Rhin, but the surrender of Alsace to Germany left him without a seat. He resigned and retired to St. Sébastien, Spain, in order to avoid voting for the ratification of the treaty.

Meantime Paris fell into the hands of the commune, and had to be reconquered by the troops of M. Thiers. Gambetta was reelected to the assembly at the supplemental elections in July, but his little band of followers were in a hopeless minority, and royalism and clericalism dominated the representative chamber. Little by little Gambetta succeeded in reorganizing the scattered Republicans. In 1872 he made a tour through the south of France, which was one continued ovation. At Grenoble, in September of that year, he made a memorable speech in opposition to the policy of M. Thiers, and when that statesman was driven from power in May, 1873, Gambetta had once more become the leader of a united party, which he ultimately led to victory. At this period of his public career the fiery advocate, the organizer of the patriot army, developed new powers of self-restraint, and displayed a calmness and patience which, in the face of Orleanist plots and clerical schemes, safely led the country to the permanent adoption of a republican form of government.

In February, 1875, the assembly decreed the republican form of constitution, and Gambetta, on April 23d, made a great speech at Belleville, the Communist quarter of Paris, in which he defended and supported the new organic law. It soon became evident that Marshal MacMahon, who had succeeded M. Thiers as president of the republic, with a seven years' term allotted him, had gone over to the reactionary party. The years 1876 and 1877 were probably those of the greatest perils the Third Republic had known. DeBroglie was plotting for the return of the Orleanists; MacMahon was a royalist at heart, and the Ultramontanes and Bonapartists were ready for anything. Gambetta was president of the budget committee of the assembly, and thus controlled the purse-strings of the nation. The reactionary attempt of May 16, 1877, united the Republicans, and in October of that year their triumph at the polls was complete. In January, 1879, Gambetta, by his famous "soumettre ou démettre" (submit or resign) speech addressed to MacMahon, forced his resignation and M. Grévy became president for the first time.

Republican institutions had become incorporated in the law of the land, and the new chief of the state proved anxious to rule constitutionally. Gambetta, while actually holding the power in his own hands, declined to assume the responsibilities of office in 1880, and contented himself with the presi-

dency of the chamber. His great idea was the substitution of the *scrutin de liste*, or vote by departments, for the *scrutin d'arrondissement* or district voting, and until this end was reached he did not desire to take office. In August, 1880, he became president of the council, and, in November, 1881, he assumed the premiership. His ministry lasted but a few weeks, and was, in effect, wrecked by himself. He proposed a reform which would have necessitated a new election by a new body of electors, and to this the chamber would not listen. But in his partial retirement Gambetta retained his leadership of the great Republican party which he had built up and led to victory, and his return to power, either as prime minister or as president of the republic, seemed but a matter of a few months or the possibility of a day. At the height of his power the great popular tribune was stricken down. On November 27, 1882, it was reported that he had met with an accident while handling a revolver—on the last day of the year he died. The circumstances of his untimely taking-off were mysterious, but the generally accepted account refers his death to the hand of a woman. Gambetta was honored and France honored herself by a public funeral of unexampled pomp, and a magnificent colossal statue of him has been raised in Paris.

GARARENTES, the ancient name of a warlike people of the desert of Sahara, who were engaged in the caravan trade across the desert. Their descendants, if any exist, are known by other names.

GARCIA-CALDERON, FRANCISCO, born in Arequipa, Peru, in April, 1829; became professor of philosophy and mathematics in the university of his native city; was afterwards elected to the chamber, and became secretary of the treasury in 1868. He attempted to form a new government after the war with Chili and the fall of Lima, and was sent to Chili as a prisoner. In 1884 he was elected to the Senate and became president of that body.

GARCIN DE TASSY, JOSEPH HÉLIODORE SAGESSE VERTU, French orientalist, born at Marseilles, Jan. 20, 1794, died in Paris, Sept. 2, 1878. He studied oriental languages under Silvestre de Sacy, and was appointed professor in the Institute in 1838. He published *Mémoires sur les Particularités de la Religion Musulmans dans l'Inde* (1832); *Histoire de la Littérature Hindoue et Hindoustans* (1837); *La Poesie Philosophique et Religieuse chez les Persans* (1864); and *Rhetorique et Prosodie des Langues de l'Orient Musulman* (1873).

GARDANT: in heraldry, said of an animal which is represented full-faced, and looking forward.

GARDEN, ALEXANDER (1730-1791), an English naturalist. In 1752 he settled in Charleston, S. C., and began the practice of medicine. He subsequently became an eminent physician and botanist, and in 1754 accepted a professorship in King's (now Columbia) College. In 1773 he became a member of the Royal Society of London, and later was vice-president. He adhered to the royal cause in the Revolution, and went to England in 1783. His property in South Carolina was confiscated, but afterwards was restored to his son. He published numerous works on botanical and zoological subjects.

GARDEN CITY, a village of Queens county, N. Y., situated on Long Island about 18 miles east of New York city. It was founded by the late A. T. Stewart, and is now held by his estate in fee in its entirety. It is the seat of the Protestant Episcopal bishop of Long Island, and contains about 100 houses; the streets and avenues are wide, lighted by gas, and bordered by ornamental trees, and the whole property is supplied with abundance of pure

water. The hotel is surrounded by a park of 30 acres, beautifully laid out. The memorial cathedral of the Incarnation, Protestant Episcopal, is a fine example of Gothic architecture, and the Memorial School, St. Paul's, for boys, is the largest and most complete school institution in the country. There is also a female seminary. Each of the ecclesiastical buildings is surrounded by an extensive park of its own.

GARDEN GROVE, a village of Decatur county, Ia., situated on a branch of the Burlington and Missouri River Railroad, about 60 miles south of Des Moines. It has a good steam flouring-mill and excellent schools.

GARDINER, SAMUEL RAWSON, historian, was born at Ropley, in Hampshire, March 4, 1829, and educated at Winchester and at Christ Church, Oxford, taking a first-class in 1851. For some years he filled the chair of Modern History at King's College, London, but resigned it in 1885 to continue his History at Oxford on an All Souls' elective fellowship. In 1882 he was granted a Civil List pension of £150. The period to which he has devoted himself with a wonderful patience and thoroughness of study, and a remarkably candid and unbiased openness of mind to the documents and the evidence of the time itself, is that of the first two Stuart kings of England. His work he gave to the world in instalments, which he grouped together and republished (1883-84) in ten volumes.

GARDINER'S (or GARDNER'S) ISLAND, east of Long Island, belonging to Suffolk county, N. Y. Area, 3,300 acres. Its surface is undulating pasture land. Here treasures were dug up which were reputed to have been buried by Captain Kidd in 1699. There is a light-house at the northern end.

GARDNER, a village of Worcester county, Mass., and a flourishing manufacturing center. Great quantities of chairs are here made; 200 different varieties are manufactured, giving employment to 2,000 men. Population (1890), 8,424.

GARFIELD, JAMES ABRAM (1831-81), the twentieth President of the United States, born in Orange township, Cuyahoga county, Ohio, Nov. 19, 1831. As a boy he had few advantages, and received a common school education only. He then worked early and late at various occupations until he accumulated sufficient money to put him through college. He entered Williams in the fall of 1854, and two years later graduated with one of the highest honors of his class. Returning to Ohio, he became teacher of the classical languages at Hiram, and in the following year was made, at the age of twenty-six, its president. He then studied and practiced law, and was a member of the Ohio Senate in 1859-60. In 1861 he entered the army as colonel of the 42d Ohio volunteers, and served in South-eastern Kentucky. In 1862 he was promoted brigadier-general of volunteers, and served at Shiloh and Corinth. In 1863 he was appointed chief of staff by Gen. Rosecrans, and for gallantry at the battle of Chickamauga was promoted major-general of volunteers. He resigned shortly afterwards to occupy a seat in the 38th Congress, to which he had been elected. Throughout his public life he was a consistent advocate of a sound currency, and financial heresies of all kinds found in him a sturdy opponent. He was chairman of the committee on banking and currency in the forty-first and of the committee on appropriations in the forty-second and forty-third congresses, while in the three succeeding (Democratic) congresses his thorough knowledge of finance secured him a place on the ways and means committee. He opposed Andrew Johnson and acted throughout with the Union party in Congress. In 1876 he visited Louis-

ians to watch the counting of the electoral vote, and, although he had opposed the creation of the electoral commission, he became one of the Republican representatives in that body. On January 13, 1880, while still a member of Congress, Mr. Garfield was elected United States senator by the legislature of Ohio. At the Republican Convention held in Chicago in June, 1880, he received the nomination for President of the United States, and was elected, November 2, over his competitor, Gen. Winfield Scott Hancock, by the votes of every Northern State except New Jersey, Nevada and California, the electoral votes standing: For Gen. Garfield, 215; for Gen. Hancock, 155. On July 2, 1881, four months after his inauguration, he was shot in the depot of the Baltimore and Potomac Railroad in Washington, by Charles Jules Guiteau, a disappointed office-seeker. He lingered, suffering great pain, till September 19 of the same year, when he died at Elberon, N. J., to which place he had been removed in the hope of prolonging his life. His remains were removed to Washington, and funeral services were held in the rotunda of the Capitol. On September 26 the burial services were held at Cleveland, Ohio, and the casket was deposited in the tomb prepared for it.

GARIBALDI, GIUSEPPE (1807-82), Italian patriot, was born at Nice, in Sardinia, Italy, his father being the owner of a trading vessel and engaged in maritime pursuits. Becoming a sailor, and in 1830 a commander of a brig, he visited various Italian ports, formed the acquaintance of Mazzini and the leaders of the Italian liberal movement, and in 1834 was involved in the Young Italy movement. He was condemned to death for taking part in an attempt to seize Genoa, but escaped to South America, where he distinguished himself as a guerilla warrior and privateer in aid of the province of Rio Grande, in rebellion against the Emperor of Brazil, and where he eloped with and married Anita Riveira de Silva. In aid of the Montevideans against Rosas, the tyrant of Buenos Ayres, he won fresh renown on sea and land in 1846, and the "red shirt" of Garibaldi became famous. When, in 1847, Pope Pius IX. ascended the throne, Garibaldi tendered his services in his support, but they were not accepted; and when the Pope appeared to desert the national cause, Garibaldi threw in his lot with the revolutionary government of Rome, from which place he fled before the French and Austrians. After enduring great hardships, which his wife shared until her death from exhaustion, he succeeded in escaping to America, and for eighteen months was engaged in the business of candle-making on Staten Island, in New York harbor, and, returning to a sea-faring life, became captain of various merchantmen. In 1854 he returned to Italy, and settled down as a farmer on the island of Caprera, but in 1859 resumed arms once more, placing his sword at the disposal of Victor Emanuel, and rendering valuable services to the allies. When Victor Emanuel was elected sovereign of the Two Sicilies, Garibaldi again retired to Caprera, indignant that he had not been permitted to march on Rome, and that his veteran volunteers were not enrolled in the regular army. In 1862 he embarked on a rash expedition against Rome, and was wounded and taken prisoner at Aspromonte, being detained two months at Spezia. In the war of 1866 Garibaldi, with his two sons, was engaged and arrested by the Italian government for another rash attempt on Rome; he was once more allowed to retire to Caprera, where he wrote two novels, one of which has been translated, the *Rule of the Monk*. In 1870 he came to the assistance of the French Republic, being

placed by Gambetta in command of the volunteers of the Vosges, who distinguished themselves at Dijon in January, 1871, and he was elected to the assembly at Bordeaux.

During the remainder of his life he remained a helpless invalid, rarely leaving Caprera, of which his English friends made him entire proprietor. In 1874 he was made a member of the chamber of deputies at Rome, and took his seat. In 1880 his marriage with an adventuress in 1859 was annulled, and he married Francesca, his peasant companion, who had come to the island as nurse to the children of Teresa, his daughter, the wife of one of his officers. Garibaldi died June 2, 1882.

See *Britannica*, Vol. XIII, pp. 487-91 for an extended account of the assistance rendered by Garibaldi to the cause of Italian unity. His autobiography was published in 1887, and an English translation in 1889.

GARIGLIANO, a river of Southern Italy, rising in the Abruzzi, west of the former Lake of Fucino, and flowing after a generally southerly course of 90 miles, into the Gulf of Gaeta. It is navigable below Pontecorvo.

GARLAND, AUGUSTUS HILL, an American statesman, born in 1832. He was admitted to the Arkansas bar in 1853, and in 1861 was a member of the Provisional Congress that met in Montgomery, Ala. He was a member of the First Confederate Congress, and at the close of the civil war was a Confederate Senator. In 1867 he was elected to the U. S. Senate, but was not allowed to take his seat. In 1874 he was elected governor of Arkansas, and in 1876 was sent to the U. S. Senate. He served as Senator from 1877 to 1885, when President Cleveland appointed him Attorney-General of the United States. Mr. Garland's term of office expired with Mr. Cleveland's retirement from the Presidency.

GARLASCO, a town of Italy, in the province of Pavia, 23 miles southeast of Novara. It contains monuments of the mediæval period. Population, 6,500.

GARNEAU, FRANÇOIS XAVIER (1809-66), a Canadian historian. He was admitted as a notary in 1830. Subsequently he was clerk of the legislative assembly, member of the council of public instruction, and from 1845 till his death, city clerk of Quebec. He is the author of *Histoire du Canada, depuis sa Découverte jusqu'à nos Jours* (1852); and *Voyage en Angleterre et en France dans les Années 1831-33*.

GARNET, HENRY HIGHLAND (1815-82), an American negro clergyman, born in slavery. He taught school in Troy, N. Y., was licensed to preach in 1842, and then was pastor of a Presbyterian church in Troy for nearly 10 years. In 1850-53 he lectured on slavery in Europe, and then went to Jamaica as a missionary for the United Presbyterian church of Scotland, but returned to the United States on account of failing health. In 1855 he became pastor of Shiloh Presbyterian church in New York city, and in 1865 accepted a call to a church in Washington, D. C. In 1869 he was chosen president of Avery College, but resigned soon afterward and returned to Shiloh church. In 1881 President Garfield appointed him minister and consul-general to Liberia, and in November he sailed for Africa. A few months after his arrival he succumbed to the climate.

GARNETT, a city and county-seat of Anderson county, Kan., on the Pottawattomie River. Cheese and furniture are made here, and the city contains a college, which is under United Presbyterian control. Pop. (1890), 2,191.

GARNETT, RICHARD, an English author, born at Lichfield in 1835. His father, the Rev. Richard

Garnett, was an eminent author and philologist and one of the librarians of the British Museum. The younger Garnett was appointed assistant keeper of that great library when his father died, in 1850. In 1875 he became superintendent of the reading-room.

GARNIER, FRANCIS, sailor and traveler, was born at St. Etienne, July 25, 1839, and entering the navy fought in the Chinese war (1860-62). Appointed to a post in French Cochinchina, he promoted a great exploring expedition, of which he ultimately assumed the command. Starting from the coast of Cambodia, the expedition traveled to Shanghai by way of Yunnan. He took part in the defense of Paris in 1870-71, and subsequently traveled again in China. In the Tonkin war he took Hanoi, but was killed December 2, 1873. His chief work is *Voyage d'Exploration en Indo-Chine*.

GARNIER, JEAN LOUIS CHARLES, a French architect, born at Paris, Nov. 6, 1825. He gained the grand prize at the École des Beaux-Arts in 1842, and subsequently continued his studies in Greece and Italy. His plans were adopted for the new Paris opera house, which was completed under his direction in 1875. He also built the San Carlos theater in Monaco.

GARNIER-PAGÈS, LOUIS ANTOINE, a French author and statesman, born at Marseilles in 1803, died in 1878. He was a Republican. In 1830 he took part in the revolution at Paris, and was afterwards elected to the chamber of deputies. In the provisional government of 1848 he was minister of finance. But he was soon forced to retire into private life, because he insisted on an extra taxation in order to save the state from bankruptcy. In 1869 he was again elected to the Corps Legislatif. When the Germans besieged Paris he took part in the defense of the city. Among his writings are: *Histoire de la Révolution de 1848*, and *Histoire de la Commission Exécutive* (1869).

GAR-PIKE (*Belone*), a genus of bony fishes in the family scombrosocidae, not far from the true pikes (esocidae). They have long bodies, and both jaws are prolonged into a slender beak, beset with roughnesses and widely set teeth. They swim actively, with an undulating motion, near the surface, and catch small fishes in their jaws. The common gar-pike (*B. vulgaris* or *B. belone*) is frequent off British coasts, and is sometimes called greenbone, from the color of the bones (especially after cooking), gorebill, from its characteristic beak, or mackerel-guide, because it visits the coasts just before the mackerel. About fifty species are known from tropical and temperate seas, some twice as long as the British species.

GARRAUD, GABRIEL JOSEPH, French sculptor, born at Dijon, March 23, 1807; studied under Ramey and Rude, and first exhibited in the Salon of 1838. Among his works are *La Première Famille* (1845); *Le Secret de l'Amour* (1863), and many busts. He was chief of the Department des Beaux-Arts for a short time in 1848.

GARRETSON, JAMES EDMUND, an American physician and author, born in 1828. He graduated in medicine at the University of Pennsylvania in 1859, and began practice in Philadelphia. In 1861-63 he lectured in the Philadelphia School of Anatomy, and in 1866-69 in the University of Pennsylvania. Since 1879 he has been dean of the Philadelphia Dental College.

GARRETSVILLE, a village of Portage county, Ohio, on a division of the Atlantic and Great Western Railroad, 37 miles southeast of Cleveland. It has machine shops and various manufactures.

GARROT, a name sometimes given to a sea-duck of the genus *Clangula*, family *Anatidae*, of which

there are several species. The common garrot, *Anas* or *Fuligula clangula*, is also called *golden-eye*.

GARROTTE, a mode of execution practiced in Spain and the Spanish colonies. Originally it consisted in simply placing a cord around the neck of the criminal, who was seated on a chair fixed to a post, and then twisting the cord by means of a stick inserted between the post and the back of the neck, till strangulation was produced. Afterwards a brass collar was used, containing a screw, which the executioner turned till its point entered the spinal marrow where it unites with the brain, causing instantaneous death. In its primitive form it exactly resembles the punishment of the bowstring in use among Mohammedan nations.

GARROVILLAS DE ALCONETAR, a small town of Spain in the province of Cáceres, situated 20 miles northwest of the town of that name, on the left bank of the Tagus. It has manufactories of linen and woolen fabrics, and some trade in grain, cattle and fruit.

GAS, ILLUMINATING. See Britannica, Vol. X, pp. 87-102.

GASCONADE, a river of Missouri, winding 200 miles northeastward through a hilly and picturesque country, till it joins the Missouri River, 35 miles below Jefferson City.

GASPARIN, AGÉNOR ÉTIENNE, COMTE DE (1810-71), a French author and publicist, born at Orange in 1810. His father, Comte Adrien E. P., was in 1836 secretary of the interior, and Agénor at that time was employed under his father. In 1842 he was elected to the chamber of deputies. Although a member of the nobility of France, Count Gasparin favored many liberal measures, being moved thereto by his Protestant principles. During the revolution of 1848 he was in the East. He did not favor the empire established by Napoleon III. For this reason he removed to Switzerland, and lectured at Geneva on social, religious and historical subjects. As he was an enemy to slavery he expressed the warmest friendship for the cause of the Union during our late civil war, and published two works in its behalf: *Les États-Unis* in 1861; *Un Grand Peuple que se Relève* (1861); and *L'Amérique devant l'Europe* (1862). These were translated and published in New York as the *Uprising of a Great People*, and *America Before Europe*. Comte Gasparin also published several works on French Protestantism, Spiritualism, the family, moral liberty, and the *Life of Innocent III* (1874). His philanthropic labors in behalf of French refugees who flocked to Geneva hastened his death, which occurred May 14, 1871.

GASPÉ, a peninsula in the east of Quebec province, Canada, comprising the counties of Gaspé and Bonaventure, projects into the Gulf of St. Lawrence, between the estuary of that name on the north and the Bay of Chaleurs on the south. It has an area of nearly 8,000 square miles, and 34,652 inhabitants.

GASPÉ BASIN, a port of entry in Gaspé Bay. It is the seat of extensive fisheries, and is distinguished in history as being the place where Jacques Cartier landed in 1554. Population, 726.

GASTINEAU, BENJAMIN, a French writer, born at Montreuil-Bellay, in the department of Maine-et-Loire, July 12, 1823. He began to contribute to Socialist papers in 1844, entered into politics, and in 1852 was banished to Algeria. Receiving permission to return to France in 1856, he devoted himself to literature until 1870. In 1872 he was imprisoned for taking part in the insurrection of the Commune. Among his works are: *Lutte du Catholicisme et de la Philosophie* (1844); *La Guerre des Jésuites* (1845); *Le Règne de Satan, ou les Riches et les*

Pauvres (1848); *Les Victimes d'Isabelle II* (1868); and *L'Imperatrice du Bas-Empire* (1870).

GASTON, WILLIAM (1778-1844), an American jurist. He was admitted to the North Carolina bar in 1798; in 1799 was chosen to the State Senate; in 1808 to the house of delegates; and from 1813 to 1815 was a member of Congress. He was judge of the North Carolina Supreme Court from 1834 till his death, and in 1835 was prominent in revising the State constitution. In 1840 he declined the United States senatorship.

GATES, MERRILL EDWARDS, born in Warsaw, N.Y., April 6, 1848; became president of Rutgers College, N. J., in 1882, and in 1884 a member of the Board of Indian Commissioners. Later Mr. Gates accepted the presidency of Amherst College.

GATES, SIR THOMAS, governor of Virginia, was born late in the seventeenth century. His name first appears when the second charter of Virginia was given to a company on May 23, 1609. The officers therein named were West, de la Warr, Somers, Newport, Dale, Wainman and Sir Thomas Gates as lieutenant-general. The colonization of Virginia thereafter became greatly stimulated, and money was contributed in aid of the purpose, and nine vessels with nearly 600 emigrants left Europe for America, under Newport, Somers and Gates. They sailed in May, 1609. Only seven ships reached Virginia; one with its passengers was lost at sea; the other, that conveyed Gates, was stranded at one of the Bermuda Islands. Here Gates and his companions improvised two small vessels in the course of nine months, and set sail for their original destination, which they reached on May 24, 1610. They found the Virginia colony in a condition of anarchy and neglect, and its numbers reduced by sickness and famine to about fifty individuals. Gates and the colonists then decided to abandon the settlement and sail coastwise for Newfoundland in four remaining pinnaces that still floated on the river, and seek a passage to England. But no sooner had they begun their voyage than they encountered Lord de la Warr, who, ascending the river on June 9, 1610, with new colonists and fresh supplies, persuaded Gates and his party to return to Jamestown. Lord de la Warr had promised to send to the council an early report of the condition of the colony, and for this purpose dispatched Sir Thomas Gates to England. Sir Thomas, with great energy, gathered means and recruits; in August, 1611, he reached Jamestown safely with six vessels and about 300 colonists. He assumed the functions of governor, established divine worship, law and order, and in 1611 made new settlements in Henrico. In March, 1612, a third patent was granted to the company by the crown, that for the time being gave them control of the Bermuda Islands and all other islands within 300 leagues from the Virginia shore. Sir Thomas Gates returned to England in 1614 in the interest of the Colonists. Of his subsequent history we have no record.

GATINEAU, a river of Quebec, in Canada, which has its origin in a chain of lakes lying immediately north of 48° N. latitude, and, after a south-south-western course of 400 miles, enters the Ottawa River a mile below Ottawa City.

GATLING, RICHARD JORDAN, an American inventor, born in 1818. At the age of 20 he invented a screw for propelling steamers, and later a machine for sowing rice and wheat. In 1850 he invented a hemp brake; in 1857 a steam plow; and then a machine for transmitting power by means of compressed air. His fame is based, however, upon his invention of the revolving battery which bears his name. It consists of a number of breech-loading rifled barrels, made to revolve around a

common center and fed with cartridges by a hopper. The new gun with ten barrels is capable of firing 1,200 shots per minute. In 1866 it was adopted into the United States service. It has also been adopted by several European governments. More recently he has invented an improved method of casting large cannon of steel, and also a torpedo and gunboat, and a pneumatic gun for discharging high explosives, which has recently been subjected to severe tests.

GAULEY MOUNTAINS, a range of the Appalachian system in West Virginia, continuous with the ridge known farther southwest as the Cumberland Mountains.

GAULEY RIVER, West Virginia, rises in Pocahontas county, flows nearly southeastward, and falls into the great Kanawha. It is about 120 miles in length.

GAVAZZI, ALEXANDRO, a popular Italian preacher and reformer, born at Bologna in 1809, died in 1889. When 16 years old he became a monk of the Barnabite order. Soon afterwards he was appointed professor of rhetoric at Naples, where he speedily acquired a reputation as an orator. He illustrated the theory of his art by eloquent addresses in the pulpits of the chief Italian cities. On the accession of Pius IX to the papal chair, Gavazzi was one of the foremost supporters of the liberal policy which inaugurated that pontiff's reign. Having repaired to Rome, he devoted himself to the diffusion of political enlightenment and patriotic aspirations among the masses of the Roman population. Pius IX sanctioned his political labors, and appointed him almoner of a body of about 16,000 Roman troops. Gavazzi's fervid speeches brought him the title of "Peter the Hermit" of the national crusade. On the establishment of the Roman Republic, he was appointed almoner-in-chief to the national army. Under his superintendence efficient military hospitals were organized and attended by a band of Roman ladies, who volunteered their services and cooperation in the care of the wounded. After the fall of the Holy City in 1849, he left Italy, an exile, and went to England, where he delivered numerous addresses and lectures, illustrative of the political and religious aims of his country. Afterwards he visited the United States, where he lectured with brilliant success. In 1860 Father Gavazzi was present with Garibaldi during the expedition to Palermo. He was the president of the evangelization committee of the Free Italian church.

GAVI, a town of Italy, in the province of Alessandria, 5 miles south of Novi. It is of ancient origin, and is still surrounded by mediæval fortifications. Population, 6,304.

GAUVILAN MOUNTAINS, a branch of the Coast Range in California, extending through the counties of San Mateo and Santa Cruz. The highest point is Mt. Pacheco, 2,845 feet high.

GAVOTTE, a French dance of a lively yet dignified character. The music is in common time, moderately quick, and always begins on the third beat of the bar; each of the two sections of which it consists is usually repeated.

GAY, EBENEZER (1696-1787), an American Unitarian clergyman. In 1718 he became pastor of the church at Hingham, Mass., where he remained till his death, preaching in the same pulpit within three months of seventy years. He published many sermons.

GAY, SIDNEY HOWARD, an American author, born in 1814. In 1842 he became a lecturing agent for the American anti-slavery society, and from 1844 to 1857 was editor of the New York "Anti-Slavery Standard." He then became connected with the

"Tribune," and from 1862 to 1866 was managing editor. From 1867 to 1871 he was editor of the Chicago "Tribune," and from 1872 to 1874 was on the editorial staff of the New York "Evening Post." He was an ardent Abolitionist; wrote a *History of the United States* in connection with William Cullen Bryant, and was the author of a life of James Madison. He died June 25, 1888.

GAY, WINCKWORTH ALLAN, an American artist, born in 1821. He studied in Italy and France, and traveled in Egypt, China and Japan. Among his pictures exhibited at the National Academy in New York are: *Mackerel Fleet; Beverly Coast, Mass.* (1869); and *The Doge's Palace, Venice* (1875). His *Windmills of Delfshaven, Holland*, was at the Centennial Exhibition at Philadelphia in 1876.

GAYARRÉ, CHARLES ÉTIENNE ARTHUR, an American historian, born in 1805. He was admitted to the bar in 1829; was elected to the Louisiana legislature in 1830; appointed deputy attorney-general of the State in 1831, and in 1833 presiding judge of the New Orleans city court. In 1835 he was elected to the United States Senate, but impaired health prevented his taking his seat. In 1844 he again became a member of the State legislature, and was reelected in 1846. The same year he was appointed secretary of State, and again in 1850, retaining the office till 1857. Since the civil war he has been reporter of the State Supreme Court. He is the author of many historical works.

GAYARRE, JULIAN, the great Spanish tenor, born in Navarre in 1850, died in Madrid in 1890. His voice early attracted the attention of Professor Eslava, who took him to Madrid. His career was most successful. The leading European cities lauded him as the greatest tenor of his age, and many thought him the equal of Mario. Though lacking somewhat in dramatic talent, he had true musical sensibility and was able to interpret Wagner as well as those less dramatic.

GAY-HEAD, a post-township of Dukes county, Mass., a promontory forming the western portion of the Island of Martha's Vineyard. Its rocks abound with Miocene fossils. The inhabitants are chiefly Indians, who live by farming and fishing. Here is a revolving light raised 170 feet above the sea.

GAYLORD, the capital of Otsego county, Mich., on the Mackinaw division of the Michigan Central Railroad.

GEAR, JOHN HENRY, born in New York State in 1825; removed to Iowa, and in 1843 engaged in business at Burlington, of which city he was mayor in 1863. He was three times elected to the State general assembly, and served two terms as speaker of the house. In 1878-79, and again in 1880-81, he was governor of the State, and was elected to the fiftieth and fifty-first Congresses by the first Iowa district as a Republican. In 1892 he was elected to the fifty-third Congress.

GEARY, JOHN WHITE (1817-73), an American soldier. He studied engineering and law, and was admitted to the bar, but never practiced. In 1846 he was lieutenant-colonel of the 2d regiment of Pennsylvania, and for services rendered in the field was made first commander of the city of Mexico, and colonel of his regiment. In 1849 he was appointed first postmaster of San Francisco, and in 1850 was made mayor of that city. In 1856 he was appointed territorial governor of Kansas, and held the office one year. At the beginning of the civil war he raised the 28th Pennsylvania volunteers, and during the war commanded in several engagements. He several times won distinction, and attained the rank by brevet of major-general. In 1866 he became governor of Pennsylvania, and held the office to within two weeks of his death.

GEARY, THOMAS J., of Santa Rosa, was born in Boston, Mass., January 18, 1854; removed with his parents to California in April, 1863; studied law, and was admitted to the bar in 1877, and has been engaged in the practice of his profession since; was elected district attorney of Sonoma county in 1882, and served two years; was elected as a Democrat and American to the fifty-first and the fifty-second Congress, and was reelected to the fifty-third Congress.

GEFFRARD, FABRE (1806-79), a president of Hayti. In 1821 he enlisted as a private soldier in the Haytian army, and rose by successive promotions to a captaincy. In 1843 General Herard Rivière appointed Geffrard lieutenant-colonel, and he was soon afterward appointed colonel. In 1844 he became brigadier-general and commander of Jacmel. In 1845 he was appointed general of division, and in 1850 was created Duke of Tabaro. In 1859 he headed a revolt against Souloque's government, and became president of Hayti. In 1867 his government became unpopular, and there was a revolt under Salnave. Geffrard, seeing that resistance was useless, took refuge on board a French vessel and went to Jamaica, where he died.

GEHENNA, the Greek form of the Hebrew *Gehinnom*, or Valley of Hinnom. This valley, or rather narrow gorge, lies south and west of the city of Jerusalem. Here Solomon built a high place for Moloch (1 Kings, xi. 7), and indeed Gehenna seems to have become a favorite spot with the later Jewish kings for the celebration of idolatrous rites. It was here that Ahaz and Manasseh made their children pass through the fire "according to the abomination of the heathen;" and at its southeast extremity, specifically designated Tophet ("place of burning"), the hideous practice of infant sacrifice to the fire-gods was not unknown (Jeremiah, vii. 31). When King Josiah came forward as the restorer of the old and pure national faith he "defiled" the Valley of Hinnom by covering it with human bones, and after this it appears to have become "the common cesspool of the city, into which its sewage was conducted, to be carried off by the waters of the Kidron, as well as a lay-stall, where all its solid filth was collected. Hence, it became a huge nest of insects, whose larvae or 'worms' fattened on the corruption." It is also said that fires were kept constantly burning here to consume the bodies of criminals, the carcasses of animals, and whatever other offal might be combustible. Among the later Jews *Gehenna* and *Tophet* came to be symbols for hell and torment, and in this sense the former word is frequently employed by Jesus in the New Testament—e. g. Mark, ix. 47, 48.

GEIKIE, ARCHIBALD, a Scotch geologist, born at Edinburgh in 1835. He studied at the high school and University of his native city, and was in 1855 appointed a geologist in the national survey of Scotland. In 1867 he was made director of the survey, and in 1870 he was appointed professor of mineralogy and geology in the University of Edinburgh.

GEIKIE, CUNNINGHAM, a Scottish clergyman, born in Edinburgh in 1826. After his education at the high school and University of Edinburgh was finished, he followed his father to Canada, became pastor of a church near Toronto, and was subsequently called to a pastorate in Halifax. In 1862 he returned to England, and there accepted a pastorate in Sunderland. In 1876 he took orders in the Church of England, and has since his ordination held a rectorship at Paris, France, and at Barnstable, Eng. Geikie is a prominent "Low Church" leader.

GEIKIE, JAMES, a Scottish geologist, brother of Archibald, born in Edinburgh in 1839. He was educated at the high school and University of Edinburgh. In 1861 he joined the geological survey, in which service he rose to be district surveyor or local director of the survey in Scotland. He resigned this position on his appointment, in 1882, to the Murchison chair of geology and mineralogy in Edinburgh University, which he now occupies. Professor Geikie has written many important scientific papers. Among these are: *The Great Ice Age and Its Relations to the Antiquity of Man* (1874); and *Prehistoric Europe* (1881), a work treating of archæology as well as Pleistocene geology.

GELIDIUM, a species of sea-weed said to be utilized in the building of the edible birds'-nests, so much prized by the Chinese. These and allied species are largely used for food in the East, as yielding wholesome jellies.

GEMBLoux, or GEMBLours, a town of Belgium, province of Namur, celebrated as the scene of the victory of Don John of Austria over the United Netherlands in 1578. A state agricultural establishment is located here. Population, about 3,000.

GENDER, a grammatical distinction between words corresponding directly or metaphorically to the natural distinction of sex. Names applied to the male sex are said to be of the *masculine* gender; those applied to the female sex, *feminine*; while words that are neither masculine nor feminine are said to be of the *neuter* gender. In modern English we have no such thing as merely grammatical gender, save when sex is attributed metaphorically to inanimate things by such a figure of speech as personification; but in old English, as well as in Sanskrit, Greek, and Latin, inanimate things are generally either masculine or feminine; and this distinction of gender is marked by the terminations of the case-endings. In Hebrew there is no neuter, all names being either masculine nor feminine, as also in the modern Romance tongues, Italian, French, Spanish, and Portuguese. German, in matter of gender, resembles old English and the classical tongues.

GENERAL, an officer of the general staff of the army. A general commanding-in-chief would, in the field, usually command several army corps; a general, one corps; a lieutenant-general, one division; and a major-general, one brigade. The general's yearly pay is \$13,500; the lieutenant-general's is \$11,000; the major-general's, \$7,500; and the brigadier-general's, \$5,500. The rank of general was created by Congress in 1866, and bestowed on General Grant, afterwards being conferred on Sherman and Sheridan. With the death of W. T. Sherman in 1891 it became extinct. The rank held by Washington was that of lieutenant-general.

GENERAL CONVENTION, THE, a body consisting of bishops, clerical and lay delegates from each Protestant Episcopal diocese of the United States, convened every three years, and by its constitution having power to form new dioceses, to try bishops, and to establish and revise a Prayer Book. This body was organized in 1785, with a view to a closer union of the churches in the different States. It has gradually become the governing body of the church, its acts extending to all points of discipline and doctrine.

GENERALIZATION, the act of comprehending under a general name a number of objects which agree in one or more points. The result of generalization is a common name or general term which stands for the many objects in so far only as they all agree. In logic the genus is a higher class which includes a lower, the lower one being the

species; but the distinction is relative. That which is a genus in relation to its species is itself a species in regard to a higher genus.

GENERATIONS, ALTERNATION OF, an interesting complication in the life-history of many plants and animals, the organism producing offspring which are unlike itself, but which in turn gives rise to forms like the original parents. See REPRODUCTION, *Britannica*, Vol. XX, pp. 429-31.

GENESSEE RIVER rises in Potter county, Pa., flows northward through New York, and enters Lake Ontario. It is about 120 miles in length, is navigable for lake vessels for five miles, has falls at Rochester and Portageville, and its valley is a beautiful and fertile region.

GENESE, a city of Henry county, Ill., 23 miles east of Rock Island on the Mississippi River. It is a shipping point for stock and grain, and an enterprising manufacturing town. Among the articles produced are wagons, furniture, tubs, pails, flour, and agricultural implements. Pop., 3,182.

GENESE, the county-seat of Livingston county, N. Y., on the Genesee River. It has a State normal school, public library, water-works, and gas. Population, 2,286.

GENEST, EDMOND CHARLES (1765-1884), a French diplomatist. In 1789 he was sent to St. Petersburg as *chargé d'affaires*, and in 1792 was appointed minister to the United States. He was cordially welcomed by the American people; but, when he denounced the American government for remaining neutral in the troubles between France and England, and went so far as to issue commissions to privateers, ordering that their prizes should be tried and condemned by French consuls in the United States, Washington demanded and obtained his recall. Genest decided not to return to France, and was naturalized and settled in the State of New York. During his remaining years he took great interest in promoting improvements in agriculture and in the arts and sciences.

GENEVA, the capital of Geneva county, Ala., situated on the Choctawhatchee River. It has a lumber mill.

GENEVA, the county-seat of Kane county, Ill., on Fox River, 35 miles west of Chicago. It has excellent water-power, which is utilized in glucose and other factories. It has a foundry and expensive school buildings. Population, 1,692.

GENEVA, a village of Franklin county, Iowa, situated on the Central Railroad, 9 miles northwest of Ackley, and 7 miles southeast of Hampton, the capital of the county.

GENEVA, the capital of Fillmore county, Neb., 60 miles west-southwest of Lincoln. Pop., 1,580.

GENEVA, a town of Ontario county, N. Y., at the north end of Seneca Lake, about 16 miles east of Canandaigua. By rail it is 26 miles west of Auburn, and 50 miles east-southeast of Rochester. It is situated on high ground, and is the seat of Hobart College. Steamboats ply daily between Geneva and Watkins, which is about 36 miles distant. It has optical works, bending works, and manufactories of engines, boilers, and steam-heating apparatus. Population, 17,557.

GENEVA, a village of Ashtabula county, Ohio, 45 miles northeast of Cleveland. It contains a normal school, and manufactories of agricultural tools. Population (1890), 1,194.

GENEVA, a village of Walworth county, Wis., on Geneva Lake. It has a ladies' seminary and flouring-mill. Population, about 2,000.

GENII, among the ancient Romans, were protecting spirits, who were supposed to accompany every created thing from its origin to its final decay, like a second spiritual self. They belonged

not only to men, but to all things, animate and inanimate, and more especially to places. The genius of an individual was represented by the Romans as a figure in a toga, having the head veiled, and the cornucopia or patera in the hands; while local genii appear under the figure of serpents eating fruit set before them. See *DEMONOLOGY*, *Britannica*, Vol. VII, pp. 60-64; *MANES*, Vol. XV, pp. 477-78; and *PENATES*, Vol. XVIII, pp. 488-89.

GENOA (DUKE OF), THOMAS ALBERT VICTOR DE SAVOY, nephew of King Victor Emmanuel, was born Feb. 6, 1854. After receiving an English education at Harrow School, he went through a regular course of study in the Marine College at Genoa, and came out an officer of the Royal Italian Navy, in which capacity he was entrusted with the command of the *Vettor Pisani*, a corvette of the first rank, bound on a voyage round the world. The vessel completed her cruise in 1880, and the Duke's journal of the voyage was published at the close of that year.

GENOA, GULF OF, a large indentation in the northern shore of the Mediterranean north of Corsica. It has, between the towns of Oneglia on the west and Spezzia on the east, a width of nearly 90 miles, with a depth of about 30 miles.

GENOA, a village of Ottawa county, Ohio, 13 miles southeast of Toledo. It has lime-stone quarries and lumber mills. Its manufactures are washboards, wooden bowls, stoves, barrels and hoops. It has a German school and graded schools.

GENRE-PAINTING, a term in art which was originally used to indicate simply any class or kind of painting, and was always accompanied by a distinctive adjective. It has now, however, come to be applied to scenes from familiar or from rustic life.

GENS D'ARMES, a title in France originally applied to all men liable to military service, and later to the body of nobles and gentry serving under the kings of France. In the present century it denotes the armed and mounted rural police.

GENTLEMEN-AT-ARMS (formerly called the *GENTLEMEN-PENSIONERS*), the bodyguard of the British sovereign, and with the exception of the yeomen of the guard, the oldest corps in the British service. It was instituted in 1509 by Henry VIII., and now consists of a captain, a lieutenant, a standard-bearer, a clerk of the cheque, and 40 gentlemen. The pay is issued from the privy purse. Until 1861 the commissions were purchasable as in other regiments; but by a royal command of that year this system was abolished, and commissions as gentlemen-at-arms have since only been given to military officers of service and distinction. The attendance of the gentlemen-at-arms is only required at drawing-rooms, levées, coronations, and similar important state ceremonies. The appointment, which is in the sole gift of the crown, on the recommendation of the commander-in-chief, can be held in conjunction with half-pay or retired full-pay, but not simultaneously with any appointment which might involve absence at the time of the officer's services being required by the sovereign.

GENTOO, the term applied by old English writers to the Hindoos, or natives of India; and especially to the Gentoo laws, a code compiled by Sir William Jones.

GENZANO, a town of Italy, 18 miles southeast of Rome, on the Appian Way. An annual flower festival, called the *Infiorata di Genzano*, is held here on the eighth day after Corpus Christi, and attracts many visitors. Population, 5,306.

GEOCENTRIC means having the earth for a center. Thus, the moon's motions are geocentric; also, though no other of the heavenly bodies re-

volve round the earth, their motions are spoken of as geocentric when referred to, or considered as they appear from, the earth.

GEODES (*Gr.*, "earthly"), rounded hollow concretions, or indurated nodules, either empty or containing a more or less solid and free nucleus, and having the cavity frequently lined with crystals. They are sometimes called "potato stones," on account of their size and shape.

GEORGE, a division of the western province of Cape Colony, Africa, on the south coast, east of Cape Town. It contains 2,600 square miles, and about 11,000 inhabitants. It is valuable chiefly for its pasturage and its timber. The town of George stands six miles north of the coast, and has a population of over 2,000. On the coast is the port of Mossil Bay.

GEORGE I. (CHRISTIAN WILLIAM FERDINAND ADOLPHUS GEORGE), King of the Hellenes, was born Dec. 24, 1845, and served for sometime in the Danish navy. After the abdication of Otho I., the late King of Greece, in 1863, the vacant throne was tendered to Prince Christian, who, with the concurrence of his own family and the consent of the Great Powers, accepted and began to reign as King George I. on June 6, 1863. Since the year 1876, when active trouble broke out in the Balkan Peninsula, King George's position has been very difficult; but as yet he has maintained it without going to war. His country gained a considerable addition of territory by the decision of the conference which followed the Congress of Berlin. In 1886, after the revolution at Philippopolis and the Servo-Bulgarian war, Greece (under a rash minister, M. Delyannis) was for declaring war against Turkey, and was only stopped by the firm attitude of England. He was married at St. Petersburg to the Princess Olga, daughter of the Grand Duke Constantine, Oct. 27, 1867. In 1892 they celebrated their silver wedding almost simultaneously with the golden wedding of his parents, the King and Queen of Denmark.

GEORGE, ENOCH (1767-1828), an American M. E. bishop. In 1790 he was admitted into the Virginia conference, and in 1796 was presiding elder of Charleston, S. C., district. In 1803 he joined the Baltimore conference, and in 1816 was ordained a bishop. He served in this office with zeal and success until his death.

GEORGE, HENRY, an American political economist, born in 1839. In 1879 he published *Progress and Poverty*, and in 1881 published *The Irish Land Question*. In the same year he visited England and Ireland, and in 1883-84 and again in 1884-85 he visited England and Scotland. He made speeches which produced a marked effect on the land question. In 1886 he was a candidate for mayor of New York on the United Labor Party ticket, receiving 68,110 against 90,552 for Abram S. Hewitt, the Democratic candidate, and 60,435 for Theodore Roosevelt, the Republican candidate. He then founded the "Standard," a weekly newspaper, and became its editor. He is also the author of *Social Problems* (1884), and *Protection or Free Trade* (1886).

GEORGE, LAKE, sometimes called Lake Horicon, a beautiful sheet of water in New York, extending from southwest to northeast, 36 miles long and from 1 to 3 miles wide, 310 feet above sea-level; 400 feet is its greatest depth; it contains 300 islands, and has an outlet into Lake Champlain. On its shores stood Forts George and William Henry. It is a favorite summer resort.

GEORGE'S CHANNEL, *Str.*, the name applied to the south portion of that arm of the Atlantic which separates Ireland from Britain. At its northern extremity it is 64 miles in width,

and at its southern about 62; its length from north-east to southwest is about 100 miles.

GEORGE, JAMES ZACHARIAH, born in Monroe county, Ga., Oct. 20, 1826; removed to Mississippi; served in the Mexican war, commanded a cavalry regiment during the war and in 1875 became Chief Justice of the State Supreme Court. On March 4, 1881, he took his seat in the United States Senate, to which he was reelected in 1886, and again in 1892. He was a member of the constitutional convention of Mississippi held in 1890 and framed the present constitution.

GEORGETOWN, the county-seat of Clear Creek county, Col., situated in a valley of the Rocky Mountains, 51 miles west of Denver, on two branches of Clear Creek. It is in an extensive silver region, and has large reduction works. Population, 1,927.

GEORGETOWN, the county-seat of Scott county, Ky., 12 miles north of Lexington. It is in the center of the "Blue-grass country," and the business of the vicinity is farming and stock-raising. The town contains a college, two female seminaries, other schools, and has good water-power. Population, 3,000.

GEORGETOWN, the county-seat of Brown county, Ohio, 7 miles from the Ohio River. It contains a woolen mill, flour mill, and the business of the vicinity is chiefly tobacco raising. Population, 1,473.

GEORGETOWN, the county-seat of Georgetown county, S. C., on Winyaw Bay. It has direct communication with New York by schooner lines; is located in a great turpentine region, and the village contains lumber and rice mills. Population, 2,895.

GEORGETOWN, the county-seat of Williamson county, Texas, 25 miles north of Austin. The region is healthful and picturesque, and the village contains the Southwestern University. Pop., 2,447.

GEORGETOWN, D. C., a port of entry. The heights are occupied by elegant villas, and command a fine view of the country around. The city contains a number of educational institutions, including a Roman Catholic college (1789). Population (1890), 14,046.

GEORGIA, an Atlantic State of the United States, and one of the original thirteen States (see Britannica, Vol. X, pp. 434-38). Under the present constitution, which was adopted in 1877, the legislative department consists of a senate of 44 members and a house of representatives of 175 members. Senators and representatives are each elected for two years. The legislature, called the general assembly, meets biennially on the first day of November of even years, and each session is limited to forty days. The executive department consists of a governor, secretary of State, treasurer, comptroller-general, attorney-general (each of whom is elected by the people for a term of two years), and a State school commissioner. The latter is appointed by the governor for a term of two years. General elections for State officers are held biennially on the first Wednesday of October of even years. The judicial department comprises a supreme court, with a chief justice and four associates; superior courts; courts of ordinary, corresponding to the county courts of other States; and justices' courts. The judges of the supreme and superior courts are selected by the general assembly, and hold office for four years each. The ordinaries and justices of the peace are elected by the people—the former for four years and the latter for two years. The State is represented in the United States Congress by two senators and ten representatives, and is thus entitled to twelve votes in the electoral college.

The educational interests of the State are under the general direction of a State school commis-

sioner and a State board of education, while local interests are directed by county school commissioners and county boards of education. Excellent systems of graded and high schools prevail throughout the State. The State University and its branches, the Atlanta University, and the high schools of Atlanta, Macon, Augusta, and Savannah, provide for special normal instruction. The State University is located at Athens, and has branches at Milledgeville, Cuthbert, Dahlonega, and Thomasville. There is an institution for the education of the deaf and dumb at Cave Spring, and an academy for the blind at Macon. Both of these are State institutions. The Wesleyan Female College, located at Macon, was the first chartered female college in the world. Other excellent private colleges, academies, and professional schools are located in various parts of the State.

According to the census of 1890 the area of Georgia was 59,475 square miles, and the population 1,837,353. The following table shows the population by counties for 1880 and 1890:

Counties.	Population.	
	1890.	1880.

The population by decades was, in 1790, 82,548; 1800, 162,686; 1810, 252,434; 1820, 340,985; 1830, 516,823; 1840, 691,392; 1850, 906,185; 1860, 1,057,286; 1870, 1,184,109; 1880, 1,542,180; 1890, 1,837,353.

Cotton is the chief agricultural crop of Georgia. In 1888 there were 2,970,901 acres devoted to the culture of cotton, yielding 463,460,556 pounds,

valued at \$39,294,147. Indian corn came next with an acreage of 2,923,885, yielding 28,069,000 bushels, valued at \$16,841,400. Then came oats, with 618,687 acres, yielding 7,115,000 bushels, valued at \$3,770,950; wheat, 374,452 acres, yielding 1,910,000 bushels, valued at \$2,101,000; hay, 39,996 acres, yielding 47,995 tons, valued at \$646,013; potatoes, 10,291 acres, yielding 638,000 bushels, valued at \$574,238; rye, 28,456 acres, yielding 151,000 bushels, valued at \$135,735. January 1, 1890, there were in Georgia 115,629 horses, valued at \$9,582,125; 155,700 mules, valued at \$15,119,264; 354,618 milch cows, valued at \$6,113,614; 580,816 oxen and other cattle, valued at \$6,408,205; 411,846 sheep, valued at \$640,173; and 1,627,008 hogs, valued at \$5,379,540.

GOVERNORS OF GEORGIA

(Since the adoption of the United States Constitution).

George Walton.....	1789-90	William Schley.....	1835-37
Edward Telfair.....	1790-93	George B. Gilmer.....	1837-39
George Matthews.....	1793-96	Charles J. McDonald.....	1839-43
Jared Irwin.....	1796-98	George W. Crawford.....	1843-47

Wilson Lumpkins.....	1831-35		

GEORGIAN BAY, the northeastern part of Lake Huron, in the province of Ontario, Can. It is partly separated from the rest of the lake by a peninsula called Cabot's Head, and by the Great Manitoulin Island. It is about 120 miles long and 50 miles wide.

GEOTEUTHIS, a genus of fossil calamaries, peculiar to the Oolitic period. The shell or horny pen is broad and truncated in front and pointed behind, with the lateral wings shorter than the shaft. Some specimens are remarkably preserved, still showing the muscular mouth, the basis of the arms, and the ink-bag.

GERANICEÆ, an order of thalamifloral dicotyledons, herbs or undershrubs of temperate countries. The leading genera, *Geranium*, *Pelargonium* and *Erodium*, yield a great number of garden and greenhouse plants. In a wider sense the order is extended to include the closely related lints (*Linaceæ*) and sorrels (*Oxalidaceæ*), together with the *Balsaminaceæ*.

GERANIUM, a genus of exogenous plants, the type of the natural order *Geraniaceæ*, the limits of which correspond with those of the Linnean genus. This order contains at least 500 known species distributed over the world. See Britannica, Vol. IX, p. 439.

GERBIL, a rodent animal of the sub-family *Gerbillinae*, family *Muridae*, found chiefly in Asia, Africa, and Southern Europe. Gerbils are rat-like in appearance, but of a jumping habit, having elongated hind limbs. The genera are *Gerbillus*, *Mystromys*, *Otomys*, and *Dasyomys*.

GERKI, a town of the Saccato country, Africa, about 50 miles northeast of Kano. It is surrounded with walls. Population, 15,000.

GERM THEORY OF DISEASE, the view that epidemic diseases are due to bacteria, or vegetable cells, which enter the body with the air we breathe, the water we drink, and the food we eat. In some cases they enter the body by contact. They generally increase very rapidly, pervade the

system in the vital parts, undermine the strength of the body gradually and most usually terminate in the death of the individual. This theory is now definitely proved in the cases of cholera, yellow fever, typhus, consumption, small-pox, syphilis, gonorrhœa; and, in several other diseases, the presumption is strong in favor of its correctness.

Leewenhoeck observed these vegetable cells as early as 1675, and O. F. Müller classified them in 1773. But that they were the causes of the infectious diseases was not admitted even during the first half of this century, although Kircher in Germany, and Linnæus in Sweden, had advanced the idea that some of the epidemic diseases are due to bacteria. The common belief was that these diseases are caused by decaying vegetable and animal matter, as it seemed to be apparent in the case of malaria; that decaying organic matter acts as a poison; when its effluvia are taken into the body that they set up similar processes of degeneration and decay in the living tissues.

But in 1836 Cagniard de la Tour discovered that the action of yeast is caused by bacteria, or living plant-cells; and Schwann found in 1837 that putrefaction is originated in a similar way. In 1850 Rayeraud Davaine observed in the blood of cattle dead of splenic fever (called anthrax) the bacillus anthracis, a hair-like bacterium; and in 1863 Davaine proved that the anthrax bacilli are the cause of splenic fever. He produced this fever by inoculating animals with these bacilli. In 1865 L. Pasteur proved, conclusively, that a disease of the silk worms, called pebrine, which threatened to destroy the silk industry of France, was due to minute vibratile corpuscles, which filled the bodies of the silk worms and checked their vital operations. He also showed that this disease can be overcome by protecting the worms from infection.

Koch in Berlin, and Pasteur in Paris, soon afterwards made experiments with Davaine's *anthrax bacilli* and produced the splenic fever in numerous cases by inoculation; they also showed that this disease never appears in animals that are rigidly isolated from infectious material. Cultivation of *bacillus anthracis* in infusions, through several generations, was found to weaken the vitality of the germs, especially through the action of the ozone contained in the air. The subsequent inoculation of cattle with this weakened material produced in them a mild form of the disease which protected them against the effects of subsequent inoculations with the strongest virus. Thousands of cattle have been annually saved from the fatal milt fever in France alone by inoculating them with the weakened culture germs.

More recently Pasteur made researches especially into the cause and cure of rabies, the "mad-dog disease" in men and animals. He has shown that a bacterium is present in this disease, that it can be communicated by inoculation to healthy animals of various species, and that its energy may be reduced by producing a mild and harmless form of hydrophobia in men and animals bitten by mad dogs. Pasteur has also proved the parasitic origin of chicken-cholera.

Of all human diseases, it has been most clearly demonstrated in the case of small-pox that the inoculation of or contact with the bacterial matter is capable of producing the disease. In septicæmia, the inflammation of open wounds and the resulting blood poisoning are due to minute bacteria floating in the air, with which the wounds come in contact. If the instruments used in surgical opera-

tions are carefully disinfected, and the wounds are treated with sprays of carbolic acid or mercuric chloride and lotions capable of killing the bacteria present in the air, etc., the fatal disease of blood-poisoning will be prevented.

Bacteria have been discovered and isolated in diphtheria, typhoid, yellow and malarial fevers, and most recently in cholera and tuberculosis. Koch found in the tubercle of consumption a germ similar to the bacterium of leprosy. By inoculating rabbits and guinea pigs with this bacteria he produced in them genuine tuberculosis. In the intestines of cholera patients in India and Egypt he found millions of bacteria of several kinds, some of them harmless. But one kind, comma-shaped, was peculiar, and present in all cholera patients. He called it the comma bacillus. He considers it the cause of the disease, although it has been doubted by others.

The recent researches with the microscope prove that malaria (swamp fever, fever and ague) is due to a germ found in the blood of the patients. This germ is called the *plasmodium of malaria*. It can be demonstrated in every case of the disease by drawing a drop of blood and examining it carefully under a good microscope. The presence of this plasmodium is always accompanied by the same series of symptoms; and as these symptoms cease as soon as the germs disappear, the conclusion is inevitable that the germs are the true cause of the disease. Dr. Walter B. James, of New York, stated, recently, before the New York Academy of Medicine, that he had examined the blood in several hundred cases of malaria, and found the plasmodium present in all cases.

In hydrophobia and septicæmia, the microbes are introduced by contact with open wounds; but in syphilis and gonorrhœa no open wounds are required for causing infection. In these cases the disease germs are of animal growth.

GERMAIN, ANTOINE HENRI, born at Lyons, France, February 19, 1824; founded the Crédit Lyonnais, of which he is chairman. In 1869 he entered the National Assembly as a Liberal, and is still a representative, acting with the Left Center, and recognized as a high authority on financial questions. He is opposed to the present financial policy of the Republic.

GERMANIUM, a metallic element discovered in 1885 by Dr. Winckler in a silver ore (argyrodite); symbol, Ge; atomic weight, 72.3. It has a melting-point about 1650° F. (900° C.); is oxidised when heated in air; crystallises in octahedra; has a perfectly metallic luster, and is of a grayish-white color. The new metal was named after Germany. Fifteen years before its discovery its existence was prophesied by Mendeleëff.

GERMANO, SAN, a beautiful and prosperous town of Italy, situated at the base of Monte Casino, in the province of Terri di Lavoro, about 50 miles north-northwest of Naples. It contains handsome public edifices, and is surrounded by the remains of monuments and buildings of high antiquarian interest; it is built on the site and from the ruins of the ancient Volscian town, Casinum, or Casca. The district of San Germano is highly cultivated and beautiful. Population, 8,766. See MONTE CASINO, Britannica, Vol. XVI, p. 778.

GERMANTOWN, a former borough of Pennsylvania, included since 1854 in the limits of Philadelphia. Here an attack by Washington on the British camp in the early morning of Oct. 4, 1777, was repulsed, the Americans losing 1,000 men, the British 600. Population (1890), 22,000.

GERMANY

GERMANY. For the geography, history, productions, government, language, literature, and earlier statistics of Germany, and the German States, see *Britannica*, Vol. X, pp. 447-547. Present total area, 208,738 English square miles; population

in 1890, 49,416,476. Capital, Berlin, with a population of 1,579,244.

STATES, AREA AND POPULATION.—The following are the official figures giving the returns for December, 1885, and Dec. 1, 1890, and the density for 1890:

STATES OF THE EMPIRE.	Area English sq. miles.	Population Dec. 1, 1885.	Population Dec. 1, 1890.	Density per sq. mile 1890.
Prussia (with Heligoland).....	194,463	28,318,470	29,955,381	322.8

PRESENT EMPEROR AND ROYAL FAMILY.—Wilhelm II, born Jan. 27, 1859, eldest son of Friedrich III, German Emperor and King of Prussia—who was the eldest son of Wilhelm I, and was born Oct. 18, 1831; married Jan. 25, 1858, to Victoria (Empress and Queen Friedrich), Princess Royal of Great Britain, succeeded his father March 9, 1888, and died June 15, 1888, when he was succeeded by his son, Prince Friedrich Wilhelm, under the title of Wilhelm II. The Emperor married, Feb. 27, 1881, Princess Victoria; married Nov. 19, 1891, to Prince Adolphus of Schaumburg-Lippe. Born Oct. 22, 1858, daughter of the late Duke Friedrich of Schleswig-Holstein-Sonderburg-Augustenburg.

CHILDREN OF THE EMPEROR.—1. Prince Friedrich Wilhelm Victor August Ernst, born May 6, 1882, Crown-Prince of the German Empire and of Prussia; 2. Prince Wilhelm Eitel-Friedrich Christian Karl, July 7, 1883; 3. Prince Adalbert Ferdinand Berenger Victor, July 14, 1884; 4. Prince August Wilhelm Heinrich Günther Victor, Jan. 29, 1887; 5. Prince Oscar Karl Gustav Adolf, July 27, 1888; 6. Prince Joachim Franz Humbert, Dec. 17, 1890.

BROTHER AND SISTERS OF THE EMPEROR.—1. Princess Charlotte, born July 24, 1860; married Feb. 18, 1878, to Prince Bernhard, eldest son of Duke George II, of Saxe-Meiningen; offspring of the union is a daughter, Feodora, born May 12, 1879. 2. Prince Heinrich, born Aug. 14, 1862; married May 24, 1888, to Princess Irene, daughter of Grand-Duke Ludwig IV, of Hesse; offspring of the union is a son, Waldemar, born March 20, 1889. 3. Princess Victoria, born April 12, 1866. 4. Princess Sophie Dorothea, born June 14, 1870; married Oct. 27, 1889, to Crown-Prince Konstantin, of

Greece. 5. Princess Margarethe, born April 22, 1872.

AUNT OF THE EMPEROR.—Princess Louise, born Dec. 3, 1838; married Sept. 20, 1856, to Grand-Duke Friedrich, of Baden.

EMPERORS OF PRESENT EMPIRE.—1. Wilhelm I, from April 16, 1871, to March 9, 1888. 2. Friedrich, from March 9, 1888, to June 15, 1888. 3. Wilhelm II, from June 15, 1888.

SUPPORT OF THE ROYAL FAMILY.—The election of Wilhelm I, king of Prussia, as emperor of Germany bears date from April 16, 1871. The election was by vote of the Reichstag of the North German Confederation, on the initiative of all the reigning princes of Germany. The imperial dignity is now hereditary in the Prussian royal house of Hohenzollern, following the usual law of primogeniture, and the support of the royal family is provided for by the Prussian constitution. Up to within a recent period the kings of Prussia enjoyed the whole income of the state domains, amounting to about a million sterling per annum. By a decree of Jan. 17, 1820, King Friedrich Wilhelm III fixed the Krondotations at the total sum of 2,573,098½ thalers, which was sanctioned on Jan. 31, 1850, by art. 59 of the constitution; remaining, as before, dependent on the revenue derived from domains and forests. The amount of the civil list was fixed by art. 59 of the constitution of Jan. 31, 1850; but by law of April 30, 1859, it was raised 500,000 thalers; by law of Jan. 27, 1868, 1,000,000 thalers, and by law of Feb. 20, 1889, a further 3,500,000 marks. At present the total "Krondotations Rente," as far as it figures in the budgets, amounts to 15,719,296 marks, or \$3,752,770. The reigning house is also in possession

of a vast amount of private property, comprising castles, forests, and great landed estates in various parts of the kingdom, known as "Fideikommiss-und-Schatullgüter," the revenue from which mainly serves to defray the expenditure of the court and the members of the royal family.

The Royal Fideikommiss was last regulated by cabinet order of Aug. 30, 1843. Besides this the royal crown treasure, founded by King Friedrich Wilhelm III, consists of a capital of 6 millions, which has since considerably increased, and also the family Fideikommiss, likewise founded by King Friedrich Wilhelm III, for the benefit of princes born afterwards. It comprises the domains of Flatow, Krojanke and Frauendorf, as well as the Fideikommiss founded by the late Prince Karl (Glienicke). Finally, the royal house is also entitled to the House Fideikommiss of the Hohenzollern princes.

CHANCELLOR AND IMPERIAL SECRETARIES.—General Georg von Caprivi, the successor of Prince Bismarck as Chancellor of the empire, and president of the Prussian Council of Ministers, was born in 1831; entered the army in 1849; became chief of staff to the 10th corps, 1870; was appointed commander of the 30th division at Metz, 1883; was appointed head of the admiralty in 1884; and was appointed Chancellor of the empire and president of the Prussian Council, March 20, 1890. Salary, 54,000 marks.

Representative of the Chancellor and Imperial Secretary of State for the Home Office, Dr. Carl Heinrich von Boetticher, born Jan. 6, 1833; studied jurisprudence and entered state service, 1856; Landdrost at Hanover; 1876, Regierungspräsident at Schleswig; appointed Imperial Secretary of State, September, 1880; and in 1881 representative of the Chancellor of the empire. Salary, 36,000 marks.

The imperial secretaries of state number 12, including the Chancellor. They do not form a "cabinet," but act independently of one another, under the general supervision of the Chancellor. Under the latter they are the executive heads severally of the Imperial Departments, viz.: Foreign Affairs; Home Office; Admiralty; Ministry of Justice; Treasury; Post Office; Railways; Exchequer; Invalid Fund; Imperial Bank; Debt Commission. Salary of each of the department secretaries, 36,000 marks.

CONSTITUTION AND GOVERNMENT.—The constitution of the empire bears date April 16, 1871. By its terms all the States of Germany "form an eternal union for the protection of the realm and the care of the welfare of the German people." The supreme direction of the military and political affairs of the empire is vested in the king of Prussia, who, in this capacity, bears the title of Deutscher Kaiser. According to art. 2 of the constitution, "the emperor represents the empire internationally," and can declare war, if defensive, and make peace, as well as enter into treaties with other nations, and appoint and receive ambassadors. To declare war, if not merely defensive, the Kaiser must have the consent of the Bundesrath, or Federal Council, in which body, together with the Reichstag, or Diet of the Realm, are vested the legislative functions of the empire. The Bundesrath represents the individual States of Germany, and the Reichstag the German nation. The members of the Bundesrath, fifty-eight in number, are appointed by the governments of the individual States for each session, while the members of the Reichstag, 397 in number (about one for every 118,000 inhabitants), are elected by universal suffrage and ballot for the term of three years. By the law of March 19, 1888,

the duration of the legislative period is five years; the law to come into force in the legislative period beginning in 1890. The various States of Germany are represented as follows in the Bundesrath and the Reichstag:

States of the Empire.	Number of Members in Bundesrath.	Number of Deputies in Reichstag.
Kingdom of Prussia.....	17	236
" " Bavaria.....	6	48
" " Württemberg.....	4	27

Reichsland of Alsace-Lorraine.....		15
Total.....	58	397

Alsace-Lorraine is represented in the Bundesrath by four commissioners (*Kommissäre*) without votes, who are nominated by the Statthalter.

The total number of electors to the Reichstag inscribed on the lists was 10,145,877, or 21.7 per cent. of the population at the general election of 1890, while the number of actual effective voters was 7,261,659 at the same election, or 71.6 per cent. of the total electors; in 1890 it was 7,031,460. Of the 397 electoral districts 21 consists solely of towns, 107 of districts each containing a town of at least 20,000 inhabitants, and 269 of districts without any large towns. In 252 districts Protestantism is predominant, and in the remainder Roman Catholicism claims the majority. Of electoral districts with 60,000 of a population and under, there were 5 in 1887; between 60,000 and 80,000, 26; between 80,000 and 100,000, 74; between 100,000 and 120,000, 180; between 120,000 and 140,000, 105; between 140,000 and 160,000, 21; and above 160,000, 36. Of electoral districts with 12,000 voters or less, there were 4 in 1887; 12,000-16,000, 26; 16,000-20,000, 60; 20,000-24,000, 121; 24,000-28,000, 103; 28,000-32,000, 41; above 32,000 voters, 42.

Both the Bundesrath and the Reichstag meet in annual session, convoked by the Emperor. The Emperor has the right to prerogative and dissolve, after a vote by the Bundesrath, the Reichstag. Without consent of the Reichstag the prorogation may not exceed 30 days; while in case of dissolution new elections must take place within 60 days, and a new session must open within 90 days. All law for the empire must receive the votes of an absolute majority of the Bundesrath and the Reichstag. The Bundesrath is presided over by the Reichskanzler, or Chancellor of the Empire, and the president of the Reichstag is elected by the deputies.

The laws of the empire, passed by the Bundesrath and the Reichstag, to take effect, must receive the assent of the Emperor, and be countersigned when promulgated by the chancellor of the empire. All the members of the Bundesrath have the right to be present at the deliberations of the Reichstag.

Acting under the direction of the chancellor of the empire, the Bundesrath represents also a supreme administrative and consultative board, and as such has twelve standing committees—namely, for army and fortifications; for naval matters; tariff, excise, and taxes; trade and commerce; railways, posts, and telegraphs; civil and criminal law; financial accounts; foreign affairs; for Alsace-Lorraine; for the constitution; for the standing orders; and for railway tariffs. Each committee consists of representatives of at least four states of the empire; but the foreign affairs committee includes only the representatives of Bavaria, Saxony, Württemberg, and two other representatives to be elected every year.

The most recent occupation census gives the number of persons in the empire engaged in agriculture and cattle-raising as 18,840,818 out of a total of 48,000,000; in forestry, hunting and fishing, 384,637; in mining, metal works, etc., 16,058,080; in trade and commerce, 4,531,080; in domestic and other service, 938,291; in the professions, 2,222,982; without occupation or profession, 2,246,222.

The bulk of the German population is (on the basis of language) Teutonic; but in the Prussian provinces of Posen, Silesia, West and East Prussia are 2,513,500 Slavs (Poles), who, with 280,000 Walloons and French, 150,000 Lithuanians, 140,000 Danes, and about the same number of Wends, Moravians, and Bohemians, make up 3,223,500 non-Germanic inhabitants, or nearly 7 per cent. of the total population.

On Dec. 1, 1885, there were 434,525 foreigners resident in Germany, the nationalities of whom were as follows:

Austrian	155,331	British	14,889
Russian	48,853	Swedes, Norwegians ..	13,174
Dutch	45,270	Luxemburgers	11,607
Swiss	36,902	Other Europeans	26,611
French	36,708	From United States ..	15,017
Danish	20,348	Other non-Europeans ..	8,638

Besides 111 born at sea, and 1,116 of unknown nationality. In 1880 the number of foreigners was only 275,856.

The great majority of the emigrants sail from German ports and Antwerp. In 1885-90, 21,519 embarked at Rotterdam or Amsterdam; and in 1885-90 a yearly average of 4,622 at French ports, notably Havre and Bordeaux. The emigrants of 1890 by way of German ports, Antwerp, Rotterdam and Amsterdam, comprised 50,019 males, 41,906 females (76 sex not stated). The number of families was 13,024, including 40,874 persons. During the sixty-eight years from 1820 to 1890 the total emigration to the United States, which absorbs the best classes of emigrants, numbered over four and a half million individuals, and during the last twelve years nearly a million and a half. It is calculated that each represented on the average, a money value of 200 marks, or \$50, so that the total loss by this emigration amounted to over \$225,000,000. The number of emigrants to Brazil during the last twenty years (1871 to 1890) has been 39,972.

There are in Germany 21 towns of over 100,000 inhabitants, viz.: Berlin (1,579,244), Hamburg (323,923), Altona (143,249), Breslau (335,174), Munich

(348,317), Dresden (276,085), Elberfeld (125,830), Barmen (116,248), Leipzig (293,525), Cologne (281,273), Frankfurt-on-the-Main (179,850), Königsberg (161,528), Hanover (165,499), Stuttgart (189,659), Bremen (124,887), Nuremberg (142,403), Düsseldorf (144,632), Danzig (120,459), Magdeburg (202,235), Strasburg (123,545), Chemnitz (138,955).

EDUCATION AND RELIGION.—There are 21 universities in the empire, with 2,383 professors and teachers, attended by about 28,711 matriculated students. Education is general and compulsory throughout Germany. The laws of Prussia, which provide for the establishment of elementary schools (*Volksschulen*), supported from the local rates, in every town and village, and compel all parents to send their children to these or other schools, have been adopted, with slight modifications, in all the states of the empire. The school age is from six to fourteen. The system of secondary education is also practically homogeneous. Above the elementary schools rank the middle schools of the towns, the *Bürgerschulen*, and *Höhere Bürgerschulen*, which fit their pupils for business life. Children of the working classes may continue their education at the *Fortbildungs-Schulen*, or continuation schools, which are open in the evening or other convenient time. The *Gymnasien* are the most fully developed classical schools, preparing pupils in a nine years' course for the universities and the learned professions. The *Progymnasien* differ from these only in not having the highest classes. In the *Realgymnasien*, Latin, but not Greek, is taught, and what are usually termed "modern subjects" have more time devoted to them. *Realprogymnasien* have a similar course, but have no class corresponding to the highest class in the preceding. In the *Oberrealschulen* and *Realschulen* Latin is wholly displaced in favor of modern languages. In 1889, 973 secondary schools, including 53 private schools, possessed the right of granting certificates to pupils who pass the leaving examination (*Abiturienten Examen*), entitling them to serve in the army as one-year volunteers. The teachers in German schools are required to hold a government certificate, and to have undergone a year's probation. Higher schools for girls are called *Höhere Töchterschulen*. Besides these there are numerous *Gewerbeschulen*, or technical schools, *PolYTECHNICA*, normal schools, seminaries, and the universities. The total number of children of school age in 1885 was 8,609,198.

According to the last religious census, there were 29,369,847 Protestants (62.7 per cent.), 16,785,734 Catholics (35.8 per cent.), 563,172 Jews (1.2 per cent.). Adherents of the Greek church are included in "Roman Catholics," but the Old Catholics are reckoned among "Other Christians." Certain changes were introduced in 1885 in the grouping of "Other Christians" and "Others," which explain the differences between the returns for these groups for 1880 and 1885. Roman Catholics are in the majority in only three of the German States, and form more than 20 per cent. of the population in only four others.

JUSTICE AND CRIME.—In terms of judicature acts in 1877 and 1879 a uniform system of law courts was adopted throughout the empire not later than Jan. 1, 1879, though, with the exception of the Reichsgericht, all courts are directly subject to the government of the special state in which they exercise jurisdiction, and not to the Imperial government. The appointment of the judges is also a state and not an imperial function. The empire enjoys uniform codes of commercial and criminal law, though no uniform code of civil law has yet been adopted.

The lowest courts of first instance are the *Amtsgerichte*, each with a single judge, competent to try petty civil and criminal cases. There are 1,915 *Amtsgerichte* in the empire, or one for every 25,808 inhabitants. The *Landgerichte* exercise a revising jurisdiction over the *Amtsgerichte*, and also a more extensive original jurisdiction in both civil and criminal cases, divorce cases, etc. In the criminal chamber five judges sit, and a majority of four votes is required for a conviction. Jury courts (*Schwurgerichte*) are also held periodically, in which three judges preside; the jury are twelve in number. There are 171 *Landgerichte* in the empire, or one for every 289,023 of the population. The first court of second instance is the *Oberlandesgerichte*. In its criminal senate, which also has an original jurisdiction in serious cases, the number of the judges is seven. There are 28 such courts in the empire. The total number of judges on the bench in all the courts above mentioned is 7,159. In Bavaria alone there is an *Oberste Landesgericht* with 18 judges, with a revising jurisdiction over the Bavarian *Oberlandesgerichte*. The supreme court is the *Reichsgericht*, which sits at Leipsic. The judges, 79 in number, are appointed by the Emperor on the advice of the Bundesrath. The court exercises an appellate jurisdiction over all inferior courts, and also an original jurisdiction in cases of treason. It has four criminal and six civil senates.

THE GERMAN ARMY.—The German army on a peace footing consists of 20,440 officers and 491,217 men, with 93,908 horses and 1,914 guns from Oct. 1, 1890.* On a war footing the total strength amounts to 35,427 officers and 1,456,677 men, with 312,731 horses and 2,808 guns. The field army has 744,031 men and 19,391 officers, 242,415 horses and 2,040 guns; the depot troops, *Ersatztruppen*, number 296,614 men, 4,796 officers, with 31,373 horses and 444 guns; the garrison troops, *Besatzungstruppen*, with 416,032 men, 11,240 officers, 38,943 horses, and 324 guns. The *Landsturm*, a last reserve, is not included in the above, but it is not organized in time of peace. Service in the army is compulsory. In 1887, 41,135 men, forming 31 battalions, 24 field batteries, 9 companies of pioneers, and 14 of train, were added to the peace establishment. On a war footing, Germany is prepared to place more than 3,350,000 men in the field, fully armed. As no official statement respecting the army is issued, the above figures are said to be merely conjectural.

Germany has a total frontier length of 4,570 miles. On the north it is bounded by the North Sea (293 miles), Denmark (47 miles), and the Baltic (927 miles); on the south, well-defined mountain ranges and the Lake of Constance separate it from Austria (1,403 miles) and Switzerland (256 miles). On the remaining sides, however, the boundaries are chiefly conventional, except in the southwest, where the Vosges Mountains separate Germany and France. On the east Germany is bounded by Russia for 843 miles; on the west by France (242 miles), Luxemburg (111 miles), Belgium (70 miles), and Holland (377 miles).

Some of the coast defenses and batteries have been placed under the jurisdiction of the admiralty. The empire is at present divided into ten "fortress districts" (*Festungs-Inspection*), each including a certain area with fortified places. It has 17 fortified places of the first class, serving as fortified camps, and 19 other fortresses. These

fortresses are all connected with each other by means of underground telegraphs, while strategical railway lines lead from the principal military centers towards the frontiers.

All German troops are bound by the imperial constitution of April 16, 1871, to obey unconditionally the orders of the Kaiser, and must swear accordingly the oath of fidelity. But this oath to the Kaiser is not imposed upon the Bavarian troops in time of peace. Art. 65 of the constitution gives the Emperor the right of ordering the erection of fortresses in any part of the empire; and art. 68 invests him with the power, in case of threatened disturbance of order, to declare any country or district in a state of siege. The constitution of the army is regulated by various military laws passed between 1867 and 1888; the Prussian military legislation before 1871 being extended to the empire.

By the constitution of April 16, 1871, it is enacted that "every German is liable to service—and no substitution is allowed." Every German capable of bearing arms has to be in the standing army (or navy) for seven years, as a rule from the finished twentieth till the commencing twenty-eighth year of his age, though liability to service begins on the completion of the seventeenth year. Of the seven years, three must be spent in active service and the remaining four in the army of reserve. Conscripts, whose conduct or proficiency earns them the privilege, are sometimes discharged from active service at the end of two years, though liable to recall. They are familiarly known as "*Königs Urlauber*." After quitting the army of reserve, the conscript has to form part of the *Landwehr* for another five years in the first class or "ban," and up to his thirty-ninth year in the second "ban."

About 400,000 young men reach the age of twenty every year, and when the numbers of those morally or physically unfit to serve, of volunteers and of emigrants, are deducted, about 300,000 are left liable to service. Of these, however, owing to the legal limitation of the peace strength, only a certain number (chosen by lot) join the army; the remainder are drafted into the *Ersatztruppen*, a kind of reserve, where the period of service is twelve years. Men in the *Ersatztruppen*, are liable to three periods of drill (of ten, six, and four weeks, respectively); but as financial considerations allow of only a certain number being so drilled, many receive no military training at all. At the end of twelve years the trained members of the *Ersatz* pass into the first ban of the *Landsturm*, the untrained into the second ban.

One-year volunteers, of whom about 8,000 join annually, serve at their own charges, and are not reckoned in the legal peace strength. Non-commissioned officers are generally appointed from men desiring to make the army their profession.

All able-bodied men between the ages of seventeen and forty-five, who are neither in the standing army nor the reserves, must belong to the *Landsturm*, which is only called out in the event of an invasion of Germany. The *Landsturm* is divided into two classes, or "bans." To the first ban belong those between the ages of seventeen and thirty-nine; to the second, those between thirty-nine and forty-five.

The mass of soldiers thus raised is divided into companies, battalions, regiments, and corps d'armée. The strength of an ordinary battalion in peace is 544 men, raised in war to 1,002 by calling in part of the reserves; it is divided into four companies, each of which in war consists of 250 men. Exceptions to this general rule are the battalions of the Guards and the regiments in garrison in the Reichsland of Alsace-Lorraine, the strength of

* By the law of March 11, 1887, to continue in force to March 31, 1894, the peace strength of the imperial army is 468,409 men, besides officers, surgeons, paymasters, etc.—in all, 491,955.

which, on peace footing, is 686 men. During peace each regiment of infantry consists generally of three battalions, but fifteen regiments have four battalions each; each brigade of two regiments; each infantry division of two brigades, to which, under the command of the divisional general, four squadrons of cavalry, four batteries of artillery, each of six guns, and either a battalion of riflemen or a battalion of pioneers are attached. Each field artillery regiment is divided into three detachments, each of three or four batteries. In all there are 434 field batteries, of which 47 are mounted. Each battery numbers, as a rule, in peace four, in war six, fully mounted guns. In war the strength can be raised to 455 batteries. The corps d'armée is considered a unit which is independent in itself, and includes not only troops of all three arms, but a portion of all the stores and appliances which are required by a whole army. Each corps d'armée consists of two divisions of infantry, a cavalry division of four regiments, with two horse-artillery batteries attached, besides the two cavalry regiments attached to the infantry divisions, and a reserve of artillery of six field batteries and one mounted battery. There is, moreover, attached to each corps d'armée one battalion of pioneers and one of train.

The corps d'armée, with the exception of the corps of the Guards, are locally distributed through the empire.

In November, 1889, it was resolved to add two new army corps, making a total of 21. The infantry and rifles are armed with Mauser's breech-loading repeating rifle, carrying eight cartridges in the magazine and one in the chamber, with an extreme range of 3,300 yards; weight, 10 lbs. 1 oz., with bayonet, 11 lbs. 13 oz. The cavalry have swords and carbines; the lancers, swords and lances, 10 feet long, weighing $4\frac{1}{2}$ lbs.

THE GERMAN NAVY.—The imperial navy in 1891, exclusive of torpedo boats, consisted of 77 steam and sailing vessels, with 511 guns, including 29 ironclads, mounting 182 guns, 28 cruisers, with 18,051 men. There are in all 34 torpedo vessels. The following ships were in process of construction in 1890: 4 belted cruisers of 9,000 to 10,000 tons; 9 coast-defense armor-clads of 3,800 tons each; one deck-protected cruiser of 4,230 tons and 7,000 horse-power; one torpedo gunboat of 2,000 tons and 5,400 horse-power, speed 19 knots; one torpedo dispatch vessel of 1,240 tons, 4,000* horse-power, 19 knots; 2 gun-vessels of 1,100 tons, 1,500 horse-power, 14 knots. The *König Wilhelm* is the largest of the ironclads, carrying 29 guns of hammered steel.

The German navy, according to the budget of 1891, was commanded by 12 admirals, under whom there were 921 officers of all kinds, including engineers and surgeons, and 16,150 non-commissioned officers, men and sailors. The sailors of the fleet and marines are raised by conscription from among the sea-faring population, which on this account are exempt from service in the army. The total sea-faring population of Germany is estimated at 80,000, of whom 48,000 are serving in the merchant navy at home, and 6,000 in foreign navies.

Germany has two ports of war—at Kiel, on the Baltic, and Wilhelmshaven in the bay of Jade on the North Sea. The port of Wilhelmshaven is a vast artificial construction of granite, and comprises five separate harbors, with canals, sluices to regulate the tide, and an array of dry docks for ordinary and ironclad vessels.

EXPENDITURE, REVENUE, AND IMPERIAL DEBT.—The following table gives the estimated total

revenue and expenditure (including supplements) for the financial year ending March 31, 1892:

Expenditure.	Marks.
Reichstag.....	390,025
Chancellery.....	148,360
Foreign Office.....	9,161,415
Home Office.....	16,221,098
Imperial Army.....	412,550,954
Imperial Navy.....	42,818,633
Ministry of Justice.....	1,956,166
Imperial Treasury.....	336,216,420
Railways.....	334,000
Debt of Empire.....	53,861,500
Audit Office.....	607,583
Pension Fund.....	40,905,640
Invalid Fund.....	25,453,293
Increase of salaries.....	540,000
Total ordinary expenditure.....	941,135,067
Extraordinary expenditure.....	189,510,821
Grand total.....	1,130,645,888

Revenue.	Marks.
Customs and Excise Duties.....	588,996,146
Stamps.....	34,505,000
Posts and Telegraphs.....	23,790,807
Printing Office.....	1,185,300
Railways.....	20,398,500
Imperial Bank.....	2,631,700
Various departmental receipts.....	8,739,749
Interest of Invalid Fund.....	25,453,293
Interest of Imperial Funds.....	441,600
Various.....	3,128,955
Extraordinary receipts.....	98,790,369
Federal contributions.....	322,623,505
Grand total.....	1,130,645,888

The extraordinary expenditure for 1891-92 includes an expenditure of 71,303,510 marks for military purposes, 51,062,150 marks for the navy, 30,700,000 for the interior, and 10,242,500 marks for the imperial debt.

For 1891-92 the Federal contributions (*Matricular Beiträge*) amount to 316,599,300 marks, to which the principal States contribute as follows:

States.	Marks.
Prussia.....	184,678,100
Bavaria.....	41,607,600
Württemberg.....	15,409,800
Saxony.....	20,745,900
Baden.....	11,637,000
Alsace-Lorraine.....	11,885,600
Hesse.....	6,238,800
Mecklenburg-Schwerin.....	3,750,800
Saxe-Weimar.....	2,047,400
Oldenburg.....	2,227,300
Brunswick.....	2,428,900
Hamburg.....	3,382,200

For the end of 1889 the total funded debt amounted to 976,502,000 marks, and to meet the extraordinary expenditure a loan of 257,007,000 marks was granted. The debt bears interest at 4 per cent., and some of it $3\frac{1}{2}$ per cent. Besides the funded there exists an unfunded debt, represented by "Reichs-Kassenscheine," or imperial treasure bills, outstanding on March 31, 1890, to the amount of 122,908,940 marks.

As a set-off against the debt of the empire there exists a variety of invested funds. These comprise (end of 1889) the fund for invalids, 475,999,024 marks, besides 3,459,450 Frankfort florins, and 329,582 silver marks; the fortification fund, 138,548 marks; and a fund for Parliament buildings, 15,704,753 marks. The war treasure fund, 120,000,000 marks, is not invested, but preserved in gold at Spandau.

GERMAN RAILWAYS, POSTS AND TELEGRAPHS.—Most of the German railways are now owned by the imperial government. Of the 25,958 miles of railway completed and open for traffic in 1889, only 3,613 miles belonged to private companies. The total length in August, 1891, was 27,000 miles. Total capital, 10,304,442,000 marks; total expenditure for the years ending in 1890, 703,916,000 marks; total receipts, 1,271,086,000.

The postal and telegraph services in Bavaria and Württemberg are retained in the hands of their respective governments; but all other parts of the empire are united to form an imperial postal district—*Reichspostgebiet*. The financial exhibit for the united postal and telegraphic services in the year ending 1890 was as follows, in marks:

	Reichspostgebiet.	Bavaria.
Receipts.....	224,722,296	19,206,679
Expenditures.....	207,003,681	16,445,066
Surplus.....	17,718,615	2,761,913
	Württemberg.	Empire.
Receipts.....	10,011,978	253,941,253
Expenditures.....	8,437,506	231,886,252
Surplus.....	1,574,473	22,055,001

In 1890 there were in the empire 52,067 English miles of telegraph lines of wire.

THE HISTORY OF GERMANY as given in the *Britannica*, Vol. X, closes with the opening of the new Imperial Parliament, Sept. 9, 1878, and the attempted assassination of the Emperor.

For many years there had been great friction between the Vatican and the Court of Berlin as to the imperial jurisdiction over German Catholic subjects. After the accession of Leo XIII. a compromise was effected in 1883 by a modification of the laws obnoxious to the Ultramontane party. The attempt to take the life of the Emperor in 1883, together with the previous attempts, gave rise to legislative measures to repress the influence of socialism. Though limited in duration the laws were renewed from time to time, often with added stringency. Prince Bismarck, however, was not content with repressive measures; he endeavored, by improving the condition of the working-classes, to cut the ground from beneath the feet of the socialistic propagandists. The acknowledgment in the Emperor's message to the Reichstag in 1881, that the working classes have a right to be considered by the state, was followed by laws compelling employers to insure their workmen in case of sickness or of accident, and by the introduction (1888) of compulsory insurance for workmen against death and old age—measures that have been by some called "state-socialism."

The energetic commercial policy of government,

also, which, since 1879, has been strongly protectionist, has its springs in similar considerations; and the recent colonial policy, which began in 1884 with the acquisition of Angra Pequena, may be considered to be stimulated partly by desire to gratify the national self-respect, and partly to provide new outlets under the German flag for the surplus population, and new markets for the home manufactures. None of the German colonies as yet, however, either in Africa or the Pacific Ocean, has proved of any great commercial value. The assembling of the Congo Congress at Berlin in 1885 fitly marked Germany's admission to the list of colonial powers. On the maintenance and improvement of the army and navy the German government has bestowed the most unremitting care, urged especially by the attitude of the "Revanche" party in France, though hitherto the imperial policy has been entirely pacific.

Considerable parliamentary friction has been caused more than once by the unwillingness of the Reichstag to vote military supplies to the amount and in the manner demanded by the Emperor and Chancellor. The latter desire to have practically a free hand in military matters, while the national parliament seeks to exercise a constitutional control over the army resembling that illustrated in Great Britain by the annual mutiny act. A compromise was effected in 1874 in virtue of which the military strength was fixed and the supplies granted for the periods of seven years at a time. In 1886 the government proposed to terminate the current *Septennat* in 1887 instead of 1888, and to immediately add largely to the peace strength of the army. On the rejection of the bill the Reichstag was dissolved (January, 1887) by the Emperor, and an appeal made to the country. The Iron Chancellor still possessed the confidence and the gratitude of the people, and the new elections in February, 1887, resulted in a crushing defeat for the opponents of the government, notably the *Freisinnige* and the Social Democrats. One of the most remarkable features of this election was a letter written by the Pope in favor of the army bill, for which he subsequently received a *quid pro quo* in a further modification of the May laws. The military septennate bill was immediately passed, and was followed in 1888 by a military organization bill, which made several changes in the conditions of service in the landwehr. The subsequent budgets show an enormous increase in the extraordinary military expenditure. While thus seeking peace by preparing for war, Germany has not failed to use diplomacy for the same end.

A personal meeting of the Emperors of Germany, Austria and Russia in 1872 was considered a proof of a political alliance (*Dreikaiserbund*); and, when Russia drifted somewhat apart from Germany in 1878, an offensive and defensive alliance was formed between Austria and Germany in 1879. Italy afterward entered this triple alliance.

The Emperor's birthday, March 22, 1887, was celebrated throughout Germany with great rejoicings. On March 9, 1888, within a year of this celebration, William I. died and the Crown Prince was proclaimed Emperor as Frederick III. After a short reign of three months the new Emperor, uncrowned, died June 15, 1888, from an affection of the throat from which he had been a sufferer for over two years. He was succeeded by his son, William II. The young Emperor at once put an imperial policy into action. His relations with the veteran Chancellor of the empire became strained to such an extent that Bismarck resigned in 1890. He was succeeded by General George Count Von Caprivi. The new regime has strengthened the triple alliance,

weakened the old bond between Germany and Russia, gained Heligoland by agreement with England, and made laws favoring the laboring man. A religious education bill warmly advocated by the Emperor was withdrawn in deference to the opposition and the bill to strengthen the peace footing of the army met with strong resistance in 1893.

GERÔME, JÉAN LEON, a French historical genre-painter, born at Vesoul in 1824. While studying at the École des Beaux-Arts, Paris, he also enjoyed the instruction of the celebrated Delaroche, with whom he went to Italy in 1844, and there exhibited his first picture, *A Cockfight*, which brought him a third-class medal. In 1863 he was made a professor of painting at the École des Beaux-Arts. Gérôme traveled in the East in 1853, and has since often gone there for subjects for his canvases. His picture entitled *The Age of Augustus* was considered worthy to be bought by the French government in 1855. Many of his works are well known through photography.

GERONIMO, an Apache Indian chief, of whose early history nothing is known. For a long time his band had been committing depredations and finally an expedition under Gen. George Crook was sent in pursuit. On March 25, 1886, terms were made with the chief and his band, who were sent to Fort Bowie, but the Indians escaped on March 29. The expedition was pronounced a failure, and upon his request to be relieved General Crook was succeeded by General Miles. Pursuit was made until the exhausted band of Geronimo was compelled to come to terms, and, after some parleying, the chief, with fourteen companions, was sent to Fort Pickens, Florida, where he still remains.

GERRY, ELBRIDGE (1744-1814), an American statesman. He entered commercial life at an early age, soon acquired a considerable fortune, and in 1773 began a public career as a member of the general court of Massachusetts Bay. In 1776 he was chosen to the Continental Congress, and signed the Declaration of Independence. He was a member of Congress till 1780, and again from 1783 to 1785. He then accepted a seat in the Massachusetts legislature, and in 1789 was elected to the first National Congress, and reelected in 1791. In 1797 he was sent on a commission to France, and from 1810 to 1812 was governor of Massachusetts. He was then elected Vice-President of the United States, and held the office at the time of his death. Many of his speeches have been published.

GERRYMANDER: in United States politics, an arbitrary apportionment of the political divisions of a State, so contrived by the dominant party as to give a larger majority to their side. The term originated in a fancied resemblance of the outline of one of the new districts of Massachusetts, formed in 1811, to a *salamander*. It was at that time thought an unfair apportionment had been made at the instigation of Gov. Gerry. Hence the term *gerrymander*.

GERSTER, ETELKA, a Hungarian singer, born at Kaschau in 1857. The director of the Conservatory of Music at Vienna happened to hear her sing once in a religious procession, and advised her to study vocal music under Madame Marchesi. Gerster enjoyed these instructions for three years. In January, 1876, she made her *début* at Venice in Verdi's *Rigoletto* with wonderful success. After this she took up the parts of *Ophelia*, *Lucia*, *Amina*, and *Marguerite*. She then went to Berlin, where she had unexampled success. In St. Petersburg and Moscow she sang before the Tzar and Tzarina, and received special favors from the latter. Returning through Germany she appeared in London in 1877 and 1878, and was afterwards twice in the

United States, where she was much applauded. Her voice is a pure soprano. Gerster was married to M. Carlo Gardini in 1877.

GESNERACEÆ, a sub-order of *Scrophulariaceæ*, including about 700 species, mostly herbs, chiefly of tropical America. They are frequently noted for the beauty of their flowers, notably *Gloxina*, *Achimenes*, and other common inmates of our greenhouses. *Fieldia Africana*, however, yields the so-called African teak.

GESSLER, the name given to the tyrannical governor in the story of William Tell.

GETTY, GEORGE WASHINGTON, an American soldier, born in 1819. He entered the army in 1840, and was appointed first-lieutenant of artillery in 1845; was made captain in 1853, major in 1863, colonel of the 37th infantry in 1866, and was transferred to the 3d artillery in 1871. He served on the northern frontier during the Canada border disturbances in 1840; in the war with Mexico in 1847-48, in Florida in 1849-50, and during the civil war with the Army of the Potomac in the Virginia peninsular campaign. He received the brevets of lieutenant-colonel, colonel, brigadier-general, and major-general, United States Army. In 1877 he commanded the troops along the Baltimore and Ohio railroad during the riot, and was retired from service in 1883.

GETTYSBURG, the county-seat of Adams county, Pa., near the southern boundary of the State. It contains 2 granite yards, and carriage manufactories. There are several educational institutions, among which are Pennsylvania College and Lutheran Theological Seminary. There is an orphan's homestead and a National cemetery. In 1863 the famous battle of July 1st, 2d, and 3d was fought in the vicinity. Pop. (1890), 3,221.

GETTYSBURG, CAMPAIGN AND BATTLE OF. The battle between the Army of the Potomac and the Confederate forces under Gen. Lee commenced about 11 A. M., July 1, 1863, and continued till the afternoon of the 3d. It resulted in the retreat of Gen. Lee, and a Confederate loss of about 26,000 men. The Union army suffered the loss of 23,187, of whom 16,543 were killed and wounded. See Britannica, Vol. XXIII, p. 780.

GEUM, a genus of *Rosaceæ*, sub-order *Potentilleæ*. Two species are common natives of Britain, *G. urbanum*, the wood avens or herb bennet, and *G. rivale*, water avens. The so-called *G. intermedium* is usually regarded as a mere hybrid of these two species. Both are aromatic, tonic, and astringent, and of old repute among herbalists; the root-stock of *G. urbanum* was formerly gathered in early spring to impart its clove-like flavor to ale, and is still used in the preparation of liqueurs. *G. Canadense*, the chocolate root or blood root of North America, has some reputation as a mild tonic.

GHARA, formed by the junction of the Sutlej and the Beas, the most easterly of the rivers of the Punjab, unites with the Chenab. The Ghara is nowhere fordable at any season, and its breadth varies from two hundred yards to five hundred.

GHENT, TREATY OF, a treaty between the United States and Great Britain, which put an end to the war of 1812-15. It was negotiated on our part by John Q. Adams, Henry Clay, Albert Gallatin, and two other envoys at Ghent; was concluded Dec. 24, 1814, and ratified Feb. 17, 1815. Its leading provisions were restoration of possessions taken by either party from the other during the war; the appointment of a commission to decide the ownership of certain islands in Passamaquoddy bay; the provision of several commissions to settle boundaries and determine the middle of water commu-

nications; and a provision binding both parties to use their best endeavors for the abolition of the slave-trade. The treaty is remarkable for the omission of reference to some important interests; particularly the impressment of seamen, which was one of the main causes of the war.

GHERARDI, BANCROFT, was born in Jackson, La., Nov. 10, 1832. He entered the navy from Massachusetts as midshipman, 1846, and served on the Ohio, of the Pacific squadron, till 1850, entering the Naval Academy in 1852. He became master and lieutenant in 1855, and at the beginning of the civil war was on the Lancaster, of the Pacific squadron. He was made lieutenant commander in 1862, and took part in the engagement with Fort Macon in that year. In 1863-64 he successively commanded the gunboat Chocorna and the steamer Port Royal, of the West Gulf blockading squadron. In the latter vessel he took part in the battle of Mobile Bay, and distinguished himself for coolness and courage. He was promoted to commander in 1866, to captain in 1874, and to commodore in 1884, and in 1885 served on the board of examiners for promotion. In 1886 he was made commandant of the Brooklyn navy yard, and in 1887 he became rear admiral. Rear Admiral Gherardi was appointed to supervise the grand review of the naval forces of the world at Hampton Roads, in April, 1893.

GIBBET, a sort of gallows on which the bodies of criminals who had been guilty of particularly atrocious crimes were by order of the courts of justice suspended after execution, encased in an iron frame near the spot where the crime was committed. This was done for the purpose of striking terror into the evil-minded, and of affording "a comfortable sight to the relations and friends of the deceased." The practice, first recognized by law in 1752, was finally abolished in 1834.

GIBBON, JOHN, an American soldier, born in 1827. He entered the army in 1847, and served till the close of the Mexican war. In 1854-57 he was assistant instructor of artillery at West Point, and was quartermaster there in 1856-59. In 1859 he became captain in the 4th artillery, chief of artillery in Gen. McDowell's division in 1861; in 1862 was made brigadier-general of volunteers, and in 1864 major-general. In 1866-69 he was colonel of the 36th infantry; and in 1869-86 of the 7th infantry. In 1886 he was promoted brigadier-general. He is the author of *The Artillerist's Manual* (1859), and has contributed extensively to current literature.

GIBBONS, JAMES, an American Roman Catholic cardinal, born in 1834. In 1861 he was ordained priest, and became assistant priest at St. Patrick's church, Baltimore, Md. A few months later he became pastor of St. Bridget's church, and then was transferred to the cathedral, and appointed chancellor of the archdiocese. In 1868 he was made vicar apostolic of North Carolina, with the rank and title of bishop, and in 1872 was translated to the vacant see of Richmond, Va. In 1877 he was appointed coadjutor to Archbishop Bailey, of Baltimore, and the same year succeeded him. In 1886 Archbishop Gibbons became a cardinal, being the second American to receive this honor. He has published *The Faith of Our Fathers* (1871).

GIBBOSITY (Lat., gibbus, "humpbacked"), a state of disease characterized by protuberance of a part of the body; chiefly applied to humpback or other distortions depending upon disease of the spinal column.

GIBBS, JOSIAH WILLARD (1790-1861), an American philologist. From 1811 to 1815 he was a tutor in Yale College, and for some years at Andover, where he devoted himself to the study of Hebrew and bib-

lical literature. From 1824 until his death he was professor of sacred literature in the theological school of Yale College.

GIBBS, OLIVER WOLCOTT, an American chemist, born in 1822. He was graduated in 1845 at the College of Physicians and Surgeons in New York, and then studied chemistry for three years in Germany. From 1849 to 1863 he was professor of physics and chemistry in the College of the City of New York, and has since been professor in Harvard University with the charge of the laboratory of the Lawrence Scientific School.

GIBSON, CHARLES HOPPER, United States Senator from Maryland, born in Queen Anne's county, Maryland, January 19, 1842. State's attorney for Talbot county, 1870-1888. Member of Congress, as a Democrat, 1885-1891. United States Senator since 1891.

GIBSON, RANDALL LEE, born in Kentucky, September, 10, 1832. Engaged in sugar planting in Louisiana. At the beginning of the civil war he enlisted as a private, and served as colonel of the 13th Louisiana infantry. Elected to Congress in 1872, he was not allowed to take his seat. Elected again in 1874, he served until 1882, when he was elected Democratic United States Senator from Louisiana; was reelected in 1888. He died in 1892.

GIBSON, WILLIAM HAMILTON, artist, was born in Sandy Hook, Conn., October 5, 1850. He has exhibited water colors since 1872, and is a member of the New York Water Color Society.

GIDDINGS, JOSHUA REED (1795-1864), an American statesman. He was admitted to the Ohio bar in 1820, and in 1826 was elected to the legislature, serving one term. In 1838 he was chosen as a Whig to Congress, and for 20 years was a member of that body. From 1861 to his death he was United States consul-general in Canada. Mr. Giddings published a volume of his speeches (1853), and wrote *The Rebellion: Its Authors and Causes*, issued posthumously (1864).

GIERS, NICHOLAS CARLOVITCH, a Russian statesman, born May 9, 1820, and educated in the Imperial Lyceum of Czarskoe-Selo. Entering the service of the ministry of foreign affairs in 1838, he filled various diplomatic missions; was ambassador to Persia 1863-69, Berne 1869-72, and Sweden 1872-75, and in 1882 became minister of foreign affairs, which position he still (1893) retains.

GIFFORD, SANDFORD ROBINSON, artist, born in Saratoga county, N. Y., in 1823, died in 1880. He was a member of the National Academy, and exhibited some landscapes at Philadelphia (1876) and Paris (1878).

GIGNOUX, FRANÇOIS REGIS (1816-82), a French landscape painter. From 1844 to 1870 he was in Brooklyn, N. Y., and in 1851 became a member of the Academy of Design, and was first president of the Brooklyn Art Academy. He returned to France in 1870, and there resided until his death.

GIGOUX, JEAN FRANÇOIS, a French painter, born at Besançon in 1806. After studying at the École des Beaux-Arts, Paris, he exhibited his first picture in 1831. His subjects are chiefly historical; as, *The Death of Cleopatra* and *The Taking of Ghent*, and religious, as *The Baptism of Christ*, and *The Last Ecstasy of St. Mary Magdalene*. He also painted portraits, and was especially successful in his decoration of churches.

GILA RIVER rises in the western part of New Mexico, in the Sierra Madre, flows generally westward, and joins the Colorado River in Yuma county, Arizona, at the southeastern extremity of California. Its total length is variously estimated at from 500 to 600 miles. Gold and silver are found near this river in Arizona, and the ruins of an an-

cient civilization abound in its lower valley. Its chief tributaries are the Rio Verde, Rio Santa Cruz, and the Rio San Pedro.

GILBERT, SIR JOHN, born in England in 1817; has exhibited pictures both in oil and water color at the leading English galleries since 1836. He is a royal academician and president of the Royal Society of Painters in Water Colors. As an illustrator of books, pictorial newspapers, and other weekly publications, his name has, for a long period, been familiar. He contributed to the *Illustrated London News* for many years. Most of the best editions of the British classics have been illustrated by him, concluding with an edition of Shakespeare.

GILBERT, JOHN THOMAS, Irish historian, born in Dublin in 1829. He was secretary of the public record office of Ireland in 1867-75; is a member of the Royal Irish Academy, its professor of archaeology, and its librarian.

GILBERT, JOSEPH HENRY, an English chemist, born at Hull in 1817, studied at Glasgow University, at University College, London, and at Giessen, Germany—at the last mentioned place under the celebrated Liebig. After taking his doctorate at Giessen he was appointed instructor in University College, London, in 1840. He conducted a course of experiments and researches in agricultural chemistry and the physiology of farm animals, the results of which have been published in a series of valuable papers.

GILBERT, WILLIAM SCHWENCK, an English dramatist, born in London in 1836. He was educated at Great Ealing School, and received the degree of B.A. from the London University in 1857. From that time to 1862 he was a clerk in the privy council office, and in 1864 he was admitted to the bar. For many years afterward he was on the editorial staff of "Fun," in whose columns his *Bab Ballads* first appeared. His stage work began with a Christmas burlesque, *Dulcamara* (1866), which was followed by a succession of dramas, burlesques, comedies, and operas. Among his fairy comedies are *The Palace of Truth*, *Pygmalion and Galatea*, *The Wicked World*, and *Broken Hearts*. Among his comedies are *Sweethearts*, and *Engaged*. His other plays include *Charity*, *Gretchen*, *Comedy and Tragedy*, etc. In 1876 appeared his comic opera, *Trial by Jury*, in which he was associated with Arthur Sullivan. In conjunction with the latter he also produced *The Sorcerer*, *H. M. S. Pinafore*, *The Pirates of Penzance*, *Patience*, *Iolanthe*, *Princess Ida*, *The Mikado*, *Ruddigore*, *The Yeomen of the Guard*, and *The Gondoliers*.

GILCHRIST, ALEXANDER, Blake's biographer, was born at Newton Green, 1828. At the age of twelve Gilchrist entered University College, London, where he formed a friendship with the Rossettis. Leaving school at sixteen, he entered the Middle Temple in 1846, and was called to the bar in 1849, but never practiced. After collecting in Yorkshire materials for a life of Etty the painter, he settled in 1853 at Guildford. The *Life of Etty*, warmly commended by Carlyle, appeared in 1855. The following year he removed to Chelsea. Here he worked upon his *Life of Blake*. Before it was completed he died, Nov. 30, 1861. His wife completed his *Life of Blake* in 1863, and issued a second edition, with memoir of her husband, in 1880.

GILDER, JEANNETTE LEONARD, journalist, born in 1849 at Flushing, L. I. Since 1881 Miss Gilder has been associated with her brother, Joseph B., in the editorship and management of "The Critic," which they established in New York city in that year.

GILDER, RICHARD WATSON, an American journalist, son of William Henry, Sr., born in 1844. In 1865 he became an editor of the Newark, N. J.,

"Advertiser," and three years later, with Newton Crane, established the Newark "Morning Register." Mr. Gilder, in 1870, accepted the associate editorship of *Scribner's Monthly* (now *The Century Magazine*). On the death of Dr. Holland, in 1881, Mr. Gilder was made editor-in-chief of *The Century*, a position which he still holds. In addition to his editorial and literary labors, Mr. Gilder takes an active interest in all public matters. He is one of the founders of the Society of American Artists, the American Copyright League, the Author's Club, and the Free Art League. He has published four volumes of poems.

GILDER, WILLIAM HENRY, an American explorer, born in 1838. At the beginning of the Civil war he enlisted in the 5th New York volunteers, and afterward was transferred to the 40th. In 1878 he went on an expedition to King William's Land in search of the relics of Sir John Franklin, and in 1881 accompanied the Rodgers expedition in search of the *Jeannette*. He has published *Schuwatka's Search* (1881); and *Ice-Pack and Tundra* (1883).

GILDERSLEEVE, BASIL LANNÉAU, an American educator, born in 1831. He graduated at Princeton College in 1849, and studied in Germany for four years. In 1856 he was chosen professor of Greek in the University of Virginia, where he remained till 1876. Since the establishment of Johns Hopkins University he has been professor of Greek there. Professor Gildersleeve for a time edited the Baltimore "American Journal of Philology," and has published six Latin text-books, and also editions of *Persius* (1875); *Justin Martyr* (1877); and the *Olympian and Pythian Odes of Pindar* (1885).

GILES, HENRY (1809-82), an American Unitarian minister. He preached for a time in Greenock, Scotland, and then three years in Liverpool, England. In 1840 he came to the United States, and soon became eminent as a lecturer. He contributed to many periodicals, and published numerous essays.

GILES, WILLIAM BRANCH (1762-1830), an American statesman. He was admitted to the bar, and practiced for several years in Petersburg, Va. In 1791 he was elected to Congress, and served continuously till 1803, except from 1799 to 1801, when he was in the Virginia Legislature. From 1804 to 1815 he was a member of the U. S. Senate, and in 1826 was again chosen to the State Legislature. The same year he was elected governor, and held that office until 1829. He published many speeches and political letters.

GILFILLAN, GEORGE, critic and essayist, was born in 1813 at Comrie, Perthshire, where his father was Secession minister. He studied at the University of Glasgow, and at the Divinity Hall of the Secession body, afterwards the United Presbyterian Church, and in 1835 was licensed to preach. In 1836 he was ordained to the School Wynd Church, Dundee, where he remained till his death, August 13, 1878. He attained considerable reputation as a lecturer and pulpit orator, and was incessantly industrious with his pen. His friends and fellow-citizens presented him with £1,000 in 1877. His works are numerous. They display a rich but reckless fancy, and wide literary sympathies, although deficient perhaps in refinement of taste.

GILL, DAVID, born in Scotland June 12, 1843, is one of the most prominent astronomers of his time. He has published numerous reports on the solar parallax, the transit of Venus and other astronomical phenomena. He is LL.D. of Aberdeen and Edinburgh, and a fellow of the Royal Society.

GILL, THEODORE NICHOLAS, an American naturalist, born in 1837. In 1863 he became an assistant in the Smithsonian Institution, and for some years

was senior assistant librarian of Congress. From 1884 to 1887 he was professor of zoölogy in the Columbian University, Washington, D. C. Besides numerous papers on scientific subjects he has published several works on zoölogy.

GILLEM, ALVAN CULLEM (1830-75), an American soldier. In 1851-52 he served against the Seminoles; was made captain in 1861; brevetted major; was chief quartermaster of the Army of the Ohio in the Tennessee campaign; was appointed colonel 10th Tennessee volunteers in 1862; commanded a brigade in 1863; was promoted brigadier-general of volunteers; and from 1863 to the end of the war served as adjutant-general of Tennessee. He was a member of the first Tennessee Legislature that was elected, and afterward commanded the cavalry in East Tennessee. In 1866 he was promoted colonel in the U. S. army; commanded the district of Mississippi in 1867-68, and then served on the Texas frontier and in California.

GILLETT, EZRA HALL (1823-75), an American author. In 1844 he was ordained pastor of the Presbyterian church in Harlem, N. Y., and in 1868 was appointed professor of political economy, ethics and history in the University of New York. He wrote much for various periodicals, and published books on religious and historical subjects.

GILLMORE, QUINCY ADAMS, an American soldier, born in 1825. He graduated at the U. S. Military Academy in 1849; was assigned to the engineers; served three years at Hampton Roads; appointed instructor at West Point, and later treasurer and quartermaster at the Academy. In 1866 he was promoted first-lieutenant in the engineering corps; was appointed captain in 1861; engineer-in-chief of the Port Royal expedition under Gen. Sherman; brevetted lieutenant-colonel U. S. army, in 1862; was assigned to important commands in Kentucky the same year; brevetted colonel in 1863; in June was given command of the Department of the South; a month later of the 10th army corps; was brevetted brigadier-general; and then made major general of volunteers. In 1864 he commanded the 10th army corps on the James River; later commanded two divisions of the 19th army corps in the defense of Washington; and in 1865 was again in command of the Department of the South. Subsequently he was appointed engineer-in-chief of the fortifications and harbor and river improvements on the Atlantic coast south of New York. In 1863 he was promoted major, in 1874 lieutenant-colonel, and in 1883 colonel. He is the author of several works on engineering, etc. He died in 1888.

GILMAN, a town of Iroquois county, Ill., on the Illinois Central Railroad, where it crosses the Toledo and Warsaw Railroad, 81 miles southwest of Chicago. It is the northeast terminus of the Gilman, Clinton and Springfield Railroad. Pop. 1,112.

GILMAN, ARTHUR, born in Massachusetts, Nov. 5, 1821, died July 11, 1882. He was educated as an architect and constructed many fine public buildings in New York and Boston.

GILMAN, ARTHUR, born in Alton, Ill., June 22, 1837. Educated in St. Louis and New York, he received an honorary degree of master of arts from Williams College. In 1870 Mr. Gilman connected himself with the "Riverside Press" at Cambridge, Mass. In 1876 he and his wife formulated a plan which afterwards developed into the "Society for the Collegiate Instruction of Women," better known as the Harvard Annex. Mr. Gilman has contributed to the periodicals and has written many books on historical and literary subjects. His most ambitious work is an edition of Chaucer, based upon the famous Ellesmere text.

GILMAN, CAROLINE HOWARD, an American authoress, wife of Samuel Gilman, born in 1794. At the age of sixteen she wrote her first poem entitled *Jephthah's Rash Vow*, and this was followed by *Jairus's Daughter*. From 1819 to 1870 she resided in Charleston, S. C., and then went to Cambridge, Mass. From 1830 to 1839 she edited "The Rose," a magazine for children.

GILMAN, DANIEL COIT, an American educator, was born in Norwich, Conn., July 6, 1831; graduated at Yale in 1852. From 1856 until 1860 he was superintendent of schools in New Haven, State superintendent of schools in Connecticut in 1865-66, librarian of Yale 1856-65, professor of physical and political geography at Sheffield Scientific School 1863-72, president of the University of California 1872-75, and since 1875 has been president of Johns Hopkins University in Baltimore, Md. He is a member of various scientific societies, and was elected president of the American Social Science Association in 1879; in 1876 he received the degree of LL. D. from Harvard, and from Columbia in 1887. President Gilman has published many magazine articles and educational reports. He is the author of a number of addresses and reports. Dr. Gilman prepared the biography of James Monroe for the "American Statesman" series, and edited the writings of Francis Lieber.

GILMER, JEREMY FRANCIS, born in Guilford county, N. C., February 23, 1818; graduated at West Point in 1839, and served in the engineer corps until 1861, when he resigned to enter the Confederate service. He became attached to the staff of Gen. Albert Sidney Johnston, was wounded at Shiloh, and assisted in the defense of Charleston and Richmond.

GILMORE, JAMES ROBERTS, better known as "Edmund Kirke," born in 1823. He became a partner in a counting-room before he was of age, and in 1848 became the head of a cotton and shipping firm in New York city, from which he retired before the beginning of the civil war. In 1862 he founded the "Continental Monthly," but soon discontinued his connection with it. In 1873 he again engaged in business, but retired in 1883, and devoted himself to literature. He has written several novels, war songs and ballads, and has done some historical work.

GILMOUR, RICHARD, born in Glasgow, Scotland, Sept. 28, 1824; came to Canada and then to Pennsylvania with his parents, and at the age of twenty joined the Roman Catholic Church. In 1852 he was ordained priest; held pastorates in Cincinnati and other cities in Ohio, and on April 14, 1872, was consecrated bishop of Cleveland. He died April 13, 1891.

GILPIN, BERNARD, "the Apostle of the North," was born of an old Westmoreland family, at Kentmere Hall, in 1517, studied at Queen's College, Oxford. In 1552 he became vicar of Norton, in the diocese of Durham, but soon resigned the living to pursue his studies at Louvain. Returning to England towards the close of Mary's reign, he was appointed by his uncle, Bishop Tunstall, to be archdeacon of Durham and rector of Easington. Here his fearless honesty against pluralities and the indolence and viciousness of the clergy soon made him many enemies, whose charges of heresy Tunstall not only set aside, but, after Gilpin had resigned both his living and the archdeaconry, appointed him to be rector of Houghton-le-Spring. His last years were troubled with infirm health, from which he was relieved by death, March 4, 1583. There is a life of Gilpin written by Bishop Carleton, one of his pupils.

GILPIN, HENRY DILWOOD, born in England, April 14, 1801; removed to Pennsylvania and practiced law in Philadelphia. He became successively

United States attorney for Pennsylvania, solicitor of the treasury, and in 1840 attorney-general of the United States. Died in Philadelphia, Jan. 29, 1860.

GILROY, a city of Santa Clara county, Cal., on the Southern Pacific Railroad, 30 miles southeast of San José, the county-seat. The city is lighted with gas, supplied with good water, and has manufactories of flour and tobacco. It is surrounded by fertile land, and farming and dairying are carried on in the vicinity. Population, 1,694.

GILTHEAD (*Chrysophrys*), a genus of "seabreams" or *Sparidae*, represented by about a score of species from the warmer seas, best known by the Mediterranean species. It is also found off the Cape of Good Hope and on East Indian and Chinese coasts. The gilthead has an oblong compressed body, a single dorsal fin with spines which can be received into a groove, scaly cheeks and gill-cover, and teeth sharp like canines in front and rounded like molars behind. The length is about a foot; the back is silvery gray, shaded with blue; the belly like polished steel; the sides have golden bands and there is a half-moon shaped spot of gold between the eyes. They feed chiefly on mollusks, in search of which they are said to stir up the sand with their tails. The fish is generally found near the shore in small shoals, and its presence is sometimes betrayed to fishermen by the noise which its teeth make in crushing shells. It was often kept in the *rinaria* by the Romans, being much valued and easily fattened.

GIMBALS (Lat., *gemellus*, "a twin"), two circular brass hoops used for suspending the compass-box on board ship, so that it may always rest horizontally, unaffected by the ship's motion. The outer hoop is attached to a box or other fixed object, while the inner is constructed so as to allow of its moving freely within the outer, to which it is attached by two pivots, at the extremities of a diameter. The compass-box is attached to the inner hoop by two similar pivots at right angles to the former. Thus the compass moves freely in two directions at right angles to each other, and can always retain its horizontal position, however the vessel may roll or pitch.

GIMP, or GYMP, a kind of trimming for dress, curtains, furniture, etc., made either of silk, wool, or cotton. Its peculiarity is that fine wire is twisted into the thin cord of which it is made. Gold and silver are used in the manufacture of military gimps.

GINGAL, a large clumsy musket used by Asiatic armies in the defense of fortresses, and sometimes mounted on carriages as a light field-gun.

GINGILIE OIL, a name often given to the bland fixed oil obtained by expression from the seeds of *Sesamum indicum*. See OILS, Britannica, Vol. XVII, p. 746.

GINGKO, a large tree of the natural order *Taxaceae*, with straight erect trunk and conical head, and leaves somewhat cloven and notched at the upper extremity, shortly stalked, leathery, smooth, shining, yellowish-green, with numerous minute parallel ribs and somewhat thickened margins. The fruit is a sort of drupe, of which the fleshy part is formed by the persistent calyx, about an inch in diameter. The nut or endocarp white, a thin shell with a farinaceous kernel, which is sold for food in China; resembles an almond in flavor, with a little mixture of sourness, which is removed by boiling or roasting. It is called the maiden-hair tree from the shape of its leaves, and is very commonly cultivated for ornament. The other members of this family are fossil, and this would probably have become extinct but for its cultivation in China and Japan.

GINSENG, a root highly esteemed in China as a medicine, being regarded as possessing the most extraordinary virtues as a remedy for almost all diseases. It is sometimes sold at exorbitant prices. See Britannica, Vol. X, p. 605.

GIOJA DEL COLLE, a commercial town of Italy, in the province of Bari, 38 miles by rail, northwest of Taranto. It is believed to have been founded in the sixth century, and very valuable Græco-Roman coins and ancient vases have been found in its neighborhood. Population, 16,573.

GIOVANNI A TEDUCCIO, SAN., a town three miles east of Naples, situated near the seashore in a fertile plain. Its neighborhood is well cultivated, and embellished with beautiful villas. Population, 11,116.

GIRARD, a city and county-seat of Crawford county, Kan., whose chief trade is with stock-raisers and farmers. Population (1890), 2,541.

GIRARD, a borough of Erie county, Pa., on the Erie and Pittsburgh and Lake Shore railroads, 15 miles southwest of Erie city. It has excellent graded schools, and some manufactories.

GIRARD COLLEGE. See COLLEGES, in these Revisions and Additions.

GIRARDIN, ÉMILE DE (1806–81), a French journalist and politician, the illegitimate son of General Alexandre de Girardin and Madame Dupuy. He was born in Switzerland in 1806, and educated in Paris. Until 1827 he bore the name of Delamothé. After 1827 he assumed the name of his father, who acknowledged him in 1847. His first attempt in literature was a novel, *Émile*, in which he pleaded the cause of illegitimate children. After the July revolution in 1830 he published the *Journal des Connaissances Utiles*, which soon attained a sale of 120,000 copies. In 1836 he founded the one cent newspaper "La Presse," an Orleanist journal with a conservative tendency. As his rivals accused him of receiving subsidies from the government he got into quarrel with Armand Carrel, editor of the "National," which culminated in a duel. Carrel was fatally wounded and died. After this Girardin occupied himself ardently with politics, both as a journalist and a deputy, and gradually became a decided Republican. When Louis Napoleon was elected to the presidency, Girardin promoted his cause; but he was strongly against the *coup d'état*, and was rewarded with a short period of exile.

In 1856 Girardin sold his share in the "Presse," but became its editor again in 1862. Soon afterwards he became the editor of "Liberté," and managed this paper till 1870. He excelled all his fellows in braggadocio on the outbreak of the Franco-Prussian war. In 1874 he founded "La France," and both in its pages and the "Petit Journal" supported the Republic. His political ideas were given to the world in a number of brochures. Girardin died April 27, 1881.

GIRNAR, a sacred mountain in India, stands in the peninsula of Kathiawar, Bombay province, 10 miles east of Junagahr. It is a bare and black rock of granite rising to the height of 3,500 feet above the sea; and, as a holy place of Jainism, is covered with ruined temples. One group contains sixteen temples, nearly 3,000 feet above the sea.

GIUDICI-EMILIANI, PAOLO, an Italian author, born at Mussomeli, in Sicily, in 1819, died at Hastings, England, in 1872. At the age of sixteen he unwillingly entered a convent, where he devoted himself to the study of literature. He subsequently quitted the convent and fled into Tuscany, where he began his principal work, *La Storia della Letteratura Italiana*. About this time he received a legacy which enabled him to pursue his studies

at leisure. He became professor in the University of Pisa in 1849, and in 1861 was made secretary to the Academy of Fine Arts in Florence. In 1867 he was elected to the Italian Parliament. Other of his writings are *Storia dei Municipii Italiani* (1851), and *Storia delle Belle Arti in Italia*.

GIULIANI, GIAMBATTISTA, an Italian writer, born at Canelli, in Piedmont, in 1818, died in 1883. He made a profound study of Dante while holding various professorships in different schools of learning, and in 1845 published his celebrated *Saggio di un Nuovo Commento della Commedia di Dante Alighieri*. He was for a time censor of the Press, and performed the duties of the office with much liberality. He published *Sul Vivente Linguaggio della Toscana*; *Le Norme di Commentare la Divina Commedia*, *Teatle dall' Epistole di Dante a Cangrande* (1856); and *Metodo di Commentare la Divina Commedia*. He also published a critical and annotated edition of all the works of Dante.

GLACIER (see Britannica, Vol. X, pp. 218-20; 626-31), a river of ice in the valley of a mountain through which it descends very slowly and steadily. Glaciers are found in the Alps, in Alaska, Greenland, etc. In the winter season snow gathers in the valleys of mountain chains in large masses;

is compacted by the pressure and partial melting of the topmost layers, and gradually changes into ice, more or less viscous, and yielding to the pushing mass above and behind it. This causes the glacial motion downhill. The thickness of these ice and snow masses varies from a few feet to thousands of feet.

The surface of glaciers is often cracked and fissured, and the waters produced by the melting of the top layers percolates through the cracks and fissures, and serves to compact the mass. The lower end of a glacier is all ice; while the upper end is mostly snow and is called *névé* in French, *firn* in German. The *névé* is often a very extensive basin—a collecting reservoir for feeding the glacier; while the other portion is narrower, resembling the bed of a river, having more or less parallel sides. A row of stones, called the "lateral moraine," marks each side of this ice river. These stones are the droppings and windings from the sides of the rocky channel. Where two glaciers combine, we find a row of stones in the middle; this stone line, called the "median moraine," marks the limits of the two confluent ice rivers. Other stones are borne along by the bottom of the glacier. They scratch, polish, and channel the rocky bed as they move onward with an irresistible force, and grind the abraded materials into small pebbles, sand, and impalpable mud. This material is borne onward both by the ice and the stream of water which flows beneath the ice.

At the lower end of the glacier a heap of stones, pebbles, and mud is deposited, called the terminal moraine. If this moraine is cut or broken through, the ice front presents a cavernous, arched vault over a stream of water. This water is muddy, being mixed with the fine abraded particles from

GLACIERS.

above. In Greenland the foot of the glaciers extends to the sea-shore and pushes out over the sea-bottom. There the glaciers cover large tracts of country, including hills and valleys, and extending over thousands of square miles. The Humboldt glacier is one of the largest. It has a sea-front of 50 miles. Where the ice is pushed out into deep water, it is lifted up by reason of its being lighter than water. This lifting action breaks off huge masses, which float on the ocean, and are known as ice-bergs. In Switzerland and the Himalayas the foot of the glacier is always on levels much higher than that of the sea, because the sun's heat is sufficient to melt the ice before it reaches the lower mountain valleys.

In the Alps there are about 1,000 glaciers, some large others small. In the Himalayas they are usually larger, some 30 to 40 miles in length. In the southernmost parts of the Andes there are also some large glaciers, which extend into the fiords of the west coast. Northward the Andean glaciers decrease in size, and cease near the equator. A few glaciers occur in the Cascade range of Oregon and Washington, one upon Mount Rainier being described as 4 to 5 miles wide and 10 miles long. In British America and Alaska the glacial ice reaches to the sea level at Mount St. Elias, which is on the boundary line between British America and Alaska. East and west of this mountain there are numerous glaciers of considerable length. There are the *Guyot*, *Tyndall*, and *Agassiz* glaciers immediately around this mountain; east of it are the *Seward*, *Morrison*, *Hayden*, *Lucia*, *Dalton*, and *Hubbard* glaciers. All of these connect with a large sea of ice, called the *Malaspina Glacier*, which fronts the Pacific Ocean between the Yakutat Bay and the Ice Bay. Besides the ones here named, there are many other extensive glaciers in Alaska.

The downward movement of a glacier is too slow to be perceptible to the eye, yet it is none the less

present, and generally continuous. J. D. Forbes found (from measurements made in the Mer de Glace, Mont Blanc, near Chamouni) and first proved that the whole sheet does not possess the same rate of motion, the center advancing more rapidly than the sides. He discovered that in summer and in the fall of the year the middle of that glacier drew forward at a rate of from 1 foot 8 inches to 2 feet 3 inches, and at the sides from 1 foot 1 inch to 1 foot 7½ inches per diem. Agassiz at about the same time carried on a series of independent experiments on the glacier of the Aar, and arrived at similar conclusions. Helland later on demonstrated that in Greenland a more rapid motion was to be found, and that the Jacobshavn glacier advanced at the rate of from 48.2 feet to 64.8 feet in the twenty-four hours. This result has lately been generally confirmed, although somewhat modified, by Dr. Rink, who, from a considerable collection of data, concludes that the quickest rate of progress of the centers of the glaciers of that region averages 21 feet in twenty-four hours. In many areas in Greenland, however, the limits of the ice sheets were found to be almost stationary, and prolonged and careful observations became necessary before any progress could be noted. In these cases the configuration of the ground was the prin-

principal cause of the more gentle motion. The variation in the rate of movement in different parts of the mass is analogous to that of rivers, and there are many other points of similarity between glaciers and streams of water which will call for notice below.

The above remarks broadly point out the general movements of glaciers, but various modifying agencies are frequently present, which change for a time the regularity of the motion. Thus, when slipping down a steep incline, the rate of progress is much more rapid than when level tracts or rising ground are being traversed. The surface of the ice-sheet, too, travels with somewhat greater velocity than the lower strata, and the nature of the glacier's bed here again produces modifications. When the path is smooth and sloping, the rates of speed at which the upper and under portions advance are much more equal than when obstacles intervene, preventing the lower strata from keeping up an equal ratio of motion with the portions nearer to and at the surface.

The glaciers which now exist are the remnants of the vast ice-sheets which covered Northern Europe and America during the glacial period. That of Europe extended south from Scandinavia over Northern Germany and a great part of the British Islands; while the Alps sent out their ice rivers hundreds of miles in advance of their present limits. In America the ice-sheet was of still greater proportions. It extended over all the Northern hemisphere as far south as the terminal moraine, which it left behind it. This southern limit is well marked. It passes through Long Island, Perth, Amboy, N. J., and Easton and Pittsburgh, Pa.; thence it runs through Ohio, touching the river east of Cincinnati, and extending for a few miles into Kentucky. From this point it passes onward through Middle Indiana and Illinois, and the States farther west as far as Dakota. Beyond this point the moraine disappears. This immense Atlantic glacier was paralleled by two smaller ones, which extended along the Pacific coast and the high ridges of the Rocky Mountains. As to the thickness of the Atlantic glacier, we find glacial markings 5,500 feet high in the White Mountains, 3,000 feet high in Southern Massachusetts and the Catskill region, and 1,000 feet high in Southern Connecticut. These indications point to a depth of 6,000 feet or more. In many other places in North America the surface of the rocks has been scraped, furrowed, and scoured by the motion of this stupendous mass of ice in a southerly direction. These parallel scratchings and furrowings of the rocks, wherever they were hard enough to resist weathering, can only be explained by glacial action. The ice, over a mile in thickness, had numerous sharp stones frozen into its bottom, and abraded the rocks by its scouring action. Where the rocks were soft or fissile they were broken into fragments and swept forward, thus forming or deepening valleys and lake bottoms. This accounts for the numerous lakes and rivers over the whole drainage area of the St. Lawrence River, Hudson's Bay, and the Arctic Ocean, as well as around the Great Lakes in the United States. They owe their existence to excavations made by ice, or are dammed back by ridges of glacial deposits.

Other indications of glacial action are certain geological deposits all over this region. The lowest of these deposits is the "unstratified boulder clay." This "drift" or "till" is a heterogeneous mixture of gravel, sand and clay, mixed with stones of all sizes. It is strewn alike over hill and dale to depths of 30 feet up to 300 feet, and rests often

on polished and striated rocks. Then there are numerous erratic boulders found scattered over the surface, and often over the tops and slopes of ridges. Some of these are small, but others are 40 feet long by 20 feet wide and high. Research in the localities of their origin shows that these boulders have often been transported, embedded in the ice, from 20 to 200 miles, and nearly always in a southerly direction.

When the intense cold of the Glacial period gradually ceased, the ice-sheet began a slow retreat northward, and dropped its accumulated matter all along its southern limits. These limits were not regular. High mountains, hills, and other local causes produced an irregular retreat. Local glaciers have therefore existed in the valleys of the White Mountains, those of the Rocky Mountains and of the Sierra Nevada. Terminal moraines mark the sites of these glaciers. One of them filled the Yosemite Valley, and passed down Merced Cañon. Others extended into the basin of Lake Tahoe. These local glaciers produce glacier striae differing from the regular southerly markings, and also transported boulders in other than southerly directions.

The great Atlantic glacier existing during the Glacial period is partially paralleled by the ice-sheet which now covers Greenland. This great island, 1,200 miles long and 400 to 500 miles wide, is covered with ice to a depth of 3,000 feet. This shows that conditions favorable to the production and maintenance of such ice-sheets may exist. As to the causes of the great cold during the Glacial period, various theories have been advanced, but the theory of Mr. Croll seems to be the most probable. He ascribes the phenomenon to the variation in eccentricity or ellipticity of the earth's orbit, and the cyclical change through which the earth passes.

GLADDEN, WASHINGTON, born in Pennsylvania, Feb. 11, 1836; graduated at Williams College, in 1859, and became a Congregational minister in Brooklyn and in Massachusetts, removing in 1883 to Columbus, Ohio, where he became pastor of the First Church. He has written much on social topics.

GLADSTONE, WILLIAM EWART, statesman, orator, and author, born in Liverpool, Dec. 29, 1809. He was the fourth son of Sir John Gladstone, a well-known Liverpool merchant and member of Parliament. Mr. Gladstone is of Scotch descent on both sides. He was educated at Eton, and at Christ Church, Oxford. In 1831 he graduated as a double first-class. As a speaker in the Oxford Union Debating Society and a writer for the Eton "Miscellany," he showed himself a strong opponent of all advanced measures of political reform—a pronounced conservative. The Conservative party were then looking out for a promising young man who could strengthen their ranks in Parliament. Gladstone stood for the burg of Newark, and was elected. In the House of Commons in 1833, the young orator made a decided impression. His manner, his voice, his diction, his fluency, were alike the subject of praise. He showed great parliamentary capacity.

In December, 1834, Sir Robert Peel appointed Gladstone to the office of junior lord of the treasury. In the year following he gave him the more important post of under-secretary for the colonies. Very soon Peel was defeated in an election and resigned as premier. Gladstone went with him. In 1841 Peel came back again to office, and Mr. Gladstone was made vice-president of the board of trade and master of the mint. He was at the same time sworn in as a member of the Privy Council. In 1843 he became president of

the board of trade, but he resigned after two years.

In 1847 Gladstone was elected M. P. for the University of Oxford, which he continued to represent for 18 years. He advocated the cause of Italian independence in many eloquent speeches. In 1858 he accepted a special mission to the Ionian Islands. At that time he published a three volume work on *Homer and the Homeric Age*. In 1859 he became chancellor of the exchequer, and in 1860 he carried through Parliament a commercial treaty with France. In 1865 he was returned for South Lancashire, and succeeded Earl Russell as leader of the House of Commons. Mr. Gladstone became prime minister in 1869. The Irish church was disestablished, the Elementary Education act was carried, and the Irish Land bill, but the government was beaten on the Irish University bill in 1873. In 1874 Gladstone resigned the leadership of the Liberal party. In 1880 he became again premier, after the defeat of the Disraeli administration at the polls. In 1885 he again resigned. After the short-lived administration of Lord Salisbury, Gladstone again came into power, and signaled his return to office by presenting his Irish Land and Home Rule bill. It was rejected on June 7, 1886. In consequence of this, Parliament was dissolved. Gladstone and his colleagues appealed to the country, but were defeated. On June 28, 1892, Parliament dissolved. The general elections returned the Liberals to power with a majority of 44, which through bye-elections was increased to 50. The new Parliament opened Aug. 4, and on the 11th a "no confidence" vote resulted in the defeat of the government. On the 12th Lord Salisbury resigned and on the 15th Mr. Gladstone presented to the Queen his cabinet list. His program included a redistribution of the seats of Parliament, a new law of franchise by which no man may cast more than one vote, however widely distributed his property may be, and the disestablishment of the church in Wales. Early in February, 1893, Mr. Gladstone presented his bill for home rule in Ireland which met with the approval of the Irish members, except those from Ulster.

GLAISHER, JAMES, meteorologist, born in London in 1809. From 1840-74 he was superintendent of the meteorological department of the Royal Observatory. Between 1862 and 1866 he made twenty-eight balloon ascents for the purpose of studying the higher strata of the atmosphere. He has written numerous works and papers on subjects relating to astronomy and meteorology.

GLASS (see Britannica, Vol. X, pp. 647-73) is now manufactured in the United States as follows:

The annual production of all kinds is about \$23,000,000. In hollow-ware articles there is very little foreign competition. The coarse greenish bottles are all made in this country. Only the fancy cologne and cut-glass castor bottles, decanters, etc., are imported, chiefly from France. Of common druggist's ware, as prescription bottles, stoppered bottles, and graduated bottles, we export largely to England, and to some extent also to France.

Of table-glass the United States produces articles fully equal to the English and French, except in a few styles. Our best grades of pressed glass-ware vary so little from the finest foreign cut glass that only experts in the trade can distinguish between them.

In window-glass (not plate) the American manufacturers command the market, except in those places where the English crown-glass and the cheapest styles of German window-glass are yet preferred. In fine plate-glass, glass for optical instruments, and Bohemian glassware, the French,

English, and German manufacturers are considerably ahead of the Americans. Yet there is something like \$2,500,000 worth of these kinds of glass produced yearly in this country.

The chief centers of the manufacture of glass in the United States are Pennsylvania, New Jersey, and New York. Of the Pennsylvania glass about 65 per cent. comes from Allegheny county, chiefly from Pittsburgh. There are also glass factories at Lenox, Mass., New Albany, Louisville, and Jeffersonville, Ind., and at Crystal City and St. Charles, Mo.

Pressed glass made by means of a lever-press is an American invention. It has enabled manufacturers to offer for common use glassware of graceful forms and beautiful designs, which formerly could only be afforded by the most wealthy.

The sandblast is now much used in carving, edging, and drilling glass. The invention of this process has added greatly to the economical uses of glass. By its means glass can be cut in any form, holes drilled in it, figures edged or carved on it in low or high relief, etc. As a consequence, plate-glass is largely introduced into our modern furniture, as for small shelves at bank-teller's desks, cashier's desks in stores, in ticket offices, in hand mirrors, as dial plates in clocks, for door panels, etc. These various new applications cause a steady increase in the manufacture of the finer qualities of plate glass in America.

GLASS-CRABS, the larval forms of rock lobsters, etc., but formerly regarded as adults, and made into a genus or even family. The body consists of two transparent leaf-like discs; there are beautiful eyes on long stalks, twenty pairs of appendages, and a small abdomen.

GLASS PAPER, or CLOTH, is made by sprinkling powdered glass over paper or calico, which is wet with a coat of glue, and to which the powdered glass adheres. Glass paper is extensively employed in polishing wood-work.

GLASS SPONGE, a name given to various silicious sponges, but particularly applied to *Hyalomma Sieboldi*, found in Japan. It is shaped like a cup, and is supported by a flexible, loosely-twisted cable of glass-like threads, which is sunk in the mud of the sea-bottom.

GLASSWORT, a genus of *Chenopodiaceae*, of which one species is common in salt-marshes in Britain. Several species grow abundantly on the shores of the Mediterranean, and as they contain a large quantity of soda were formerly of importance in making barilla, along with the species of saltwort.

GLAUX, a genus of primulaceous plants, represented by a single species, *G. maritima*. It is a little fleshy perennial, growing in saline localities in Europe, Asia, and North America.

GLEANING, the act of gathering that portion of a harvest which the reaper leaves behind. In England the custom of allowing the poor the gleanings had very nearly passed into a legal right, but the court of common pleas has decided that the public cannot claim the privilege as a right. The custom, however, still exists in England, though it is often restricted to the wives and children of the harvesters. In the United States the poor possess no right to glean, and the farmer may exclude them from his fields.

GLEDITSCHIA, a genus of leguminous trees, of which there are five or six species of North America, Northern Asia, and Africa. It is represented in the United States by the honey-locust, or three-thorned acacia (*G. triacanthos*), and by the water-locust, *G. monosperma*. The former is a large tree having compound leaves, large flat pods filled with a sweet pulp between the seeds, and inconspicuous

flowers. It is widely cultivated for shade and as a hedge-plant. The timber is hard and durable. The other North American species is a smaller tree growing in swamps in the Eastern United States.

GLEIG, GEORGE ROBERT, a British clergyman and author, born at Stirling, Scotland, in 1796, died in 1888. After being educated at Glasgow, and Balliol College, Oxford, he served under the Duke of Wellington in Spain. In 1814 he also served in America, but was wounded at the capture of Washington. Returned to England, he graduated at Oxford, and took ecclesiastical orders. He became curate of Ash in 1822, and afterwards rector of Ivy church. In 1846 he was appointed chaplain-general of the army, which office he resigned in 1875. As he interested himself very much in the education of the soldiers, he was also made inspector-general of the military schools. Gleig tells his early adventures in an amusing book, *The Subaltern* (1825).

GLENCOE, the county-seat of McLeod county, Minn., situated on Buffalo River. It has a seminary, grain elevators, and plenty of water and timber. Pop., 1,649.

GLENELG, CHARLES GRANT, BARON, born in India in 1778. Entering Parliament in 1807, he remained in public life until, while colonial secretary under Lord Melbourne, he was compelled to resign, in 1839, owing to his approval of Lord Dunham's ordinance referring to the Canadian rebels of 1838. Elevated to the peerage in 1835, he died at Cannes, April 23, 1866.

GLENS FALLS, a village of Warren county, N. Y., 9 miles south of Lake George. It has a famous cave, lime, black marble, water-power, water-works, gas-works, soldier's monument, two opera houses, a ladies' seminary, and numerous manufactures. Population (1890), 9,509.

GLENLIVET, the valley, in Banffshire, Scotland, of Livet Water, which runs 14 miles northwest, till at a point 5 miles south of Ballindalloch station, it falls after a total descent of 1,600 feet into the Avon, itself an affluent of the Spey. Its population is still largely Roman Catholic. Since 1824 its 200 whisky bothies have given place to one celebrated distillery. In 1594 Glenlivet was the scene of a battle, in which 10,000 Protestants under the Earl of Argyll were routed by the insurgents under the Earl of Huntly.

GLENROY, PARALLEL ROADS OF. The Roy is a small stream in the district of Lochaber, Inverness-shire, Scotland, having a course of about fifteen miles, and falling into the Spean at Inverroy, opposite to Ben Chlunaig. The valley through which the Roy runs has its slopes indented with three shelves, which are everywhere perfectly horizontal and parallel to each other. The granitic and metamorphic rocks, of which the mountains are composed, are covered with a greater or less thickness of angular fragments and earth, and an examination of the shelves shows that they are worn out of this soft alluvial coating. They almost invariably form a gentle slope from the hillside, and are from three to thirty feet wide. The highest, 1,139½ feet above sea-level, is easily followed along both sides of the valley to the point at which the valley narrows above Glen Glaster. The second shelf, eighty feet lower, is continued farther down until it includes Glen Glaster. The third line is 212 feet lower than the second; it may be traced round the mouth of the glen into the valley of the Spean.

GLENTILT, in North Perthshire, Scotland, the deep, narrow glen of the Tilt, which issues from Loch Tilt, runs sixteen miles southwest, and at

Blair-Athole falls into the Garry. It is traversed by the foot-path from Blair-Athole to Braemar. Glentilt is classic ground to the geologist, having furnished evidence for the Huttonian or denudation theory.

GLENWOOD, a city and the county-seat of Mills county, Iowa. Pop., 1,890.

GLENWOOD, a manufacturing and shipping town of Schuyler county, Mo.

GLIDDON, GEORGE ROBINS (1809-57), an American archaeologist. At an early age he went to Alexandria, and for twenty-three years resided in Egypt, for the greater part of the time serving as U. S. vice-consul. He then visited the United States, and lectured in the principal cities of the Union on Egyptian antiquities. He wrote several books on archaeology.

GLISSON, OLIVER S., born in Ohio in 1809; entered the United States navy in 1826, saw much active service during the civil war, and, in 1870, became rear-admiral. He died November 20, 1890.

GLOBE-FLOWER (*Trollius*), a small palaearctic genus of *Ranunculaceae*, with a globe of large showy sepals inclosing the small inconspicuous linear petals. The common yellow globe-flower (*T. Europæus*) is one of the finest ornaments of moist grounds in elevated districts of Northern Europe and in the Alps. It is cultivated in flower-gardens. The orange globe-flower (*T. Asiaticus*) is also common in gardens.

GLOBULINS, a group of proteid substances closely allied to albumen, but differing from it in that they are not soluble in water unless it contains a small proportion of a neutral salt, and that they are precipitated by carbonic acid, and (except vitellin) by a saturated solution of common salt. The most important globulins which occur in animal tissue are: globulin (proper) or crystallin, in the crystalline lens of the eye; fibrino-plastin, or paraglobulin and fibrinogen in blood, serous fluids, etc.; myosin, in muscle; vitellin, in the yolk of egg. Precisely similar bodies occur also in the vegetable kingdom.

GLOBUS HYSTERICUS, or BALL IN THE THROAT, the name applied to a peculiar sensation sometimes accompanying hysteria.

GLORIOSA, a genus of *Liliaceae*, of which the best-known species, *G. superba*, a native of India, is a herbaceous perennial with a weak stem, alternate simple leaves terminating in tendrils, and very beautiful flowers finely colored with red and yellow. The root-stock is poisonous but is washed for its starch-like manioc.

GLOSSITIS, inflammation of the tongue.

GLOUCESTER, a city and port of entry of Essex county, Mass., 28 miles northeast of Boston, situated on the south side of the peninsula of Cape Ann, and connected by railroad with the principal cities and towns of the seaboard and interior. Its interests are almost entirely commercial. It has a greater amount of tonnage employed in the domestic fisheries than any other port in the United States. Eighty per cent. of the vessels of all classes are employed in the fisheries, whose total value in 1876 was \$4,000,000. Of the ports of Massachusetts, only Boston surpasses Gloucester in foreign imports. The harbor is one of the best on the coast, and is accessible at all seasons for vessels of the largest class. Gloucester was occupied as a fishing station as early as 1624, being the first settlement made on the north shore of Massachusetts Bay. It was incorporated as a town in 1639, and became a city in 1874. Population in 1850, 7,786; 1860, 10,904; 1880, 19,329; 1890, 24,651.

GLOUCESTER CITY, a post-town of Camden county, N. J., on the Delaware River, and on the

Camden, Gloucester and Mount Ephraim Railroad, and the West Jersey Railroad, 3 miles south of Camden. It is connected by steam ferry with Philadelphia. Gingham, print-cloths and calicoes are made here. Population in 1870, 3,682; 1880, 5,247; 1890, 6,564.

GLOVERSVILLE, a city of Fulton county, N. Y., situated on the Cayadutta River. It was incorporated a city in 1890. A board of trade was organized in 1889. There are 60 miles of streets, mostly broad and paved with cedar blocks, the principal ones being traversed by horse-cars. The Fonda, Johnstown and Gloversville Railroad passes through the city, and connects with the New York Central and West Shore roads, and with the Erie Canal at Fonda. The water supply is abundant, brought by gravity from reservoirs 3 miles above the city. The fire and police departments are excellent. The assessed valuation of the city in 1890 was \$4,000,000, and no city debt. There is one national and one private bank, and a building and loan association. Two electric plants furnish lights for the streets and business houses and power for manufacturing purposes. Kasson's opera house is a fine brick building. The public schools are excellent. The Union free school building, erected in 1888, is a substantial three-story edifice. There is a free library containing 9,000 volumes, and a reading room with daily and weekly papers and magazines. There is a great variety of manufacturing carried on, and the city is particularly noted for the manufacture of buckskin and other gloves and mittens. Population in 1880, 7,133; 1890, 13,864.

GLUCOSE, STARCH or GRAPE SUGAR. The term "grape sugar" is often restricted to the solid varieties of the sugar made from cornstarch, while the liquid varieties alone are designated "starch sugar" or "glucose." The manufacture of glucose has long flourished in Europe. In 1882 there were 39 factories in Germany producing 18,000 tons of solid grape sugar and 19,000 tons of liquid glucose per annum.

In America this industry has only recently been introduced; and, in spite of the prejudice as to the healthfulness of glucose, its manufacture has spread so rapidly that there are at present over 30 factories in this country, using about 50,000 bushels of corn per day when they are running. When corn is low in price, and cane sugar, molasses, and barley are high, all the factories are in full operation. When the opposite conditions prevail all the glucose factories are idle. The McKinley tariff has lately crippled the glucose interest in our country, because it allows the low grades of sugar to be imported without duty.

Glucose is chiefly used in the manufacture of table syrups and confectionery, in the brewing of beer and ale, and the manufacture of artificial honey. Sometimes it is also used as food for bees. Brewers conceal the fact of its employment, and confectioners do not like to speak of their use of glucose. For making artificial honey, the combs are manufactured of paraffine and their cells filled with pure glucose by machinery. It looks white and inviting, but is less sweet than genuine honey. As it can be sold at less than half the price of the genuine article, and sweetened by the addition of cane sugar, a good deal of artificial honey has been manufactured. In the form of bleached grape sugar, glucose was largely mixed with table sugar before the adoption of the McKinley tariff.

In 1884 a committee of the National Academy of Sciences submitted a report on glucose, in response to a request made by the commissioner of internal revenue. Their report declared that the sweetening power of grape sugar is about two-thirds that

of cane sugar. Many experiments were made by the committee with reference to the healthfulness of glucose, it being taken internally in various conditions. In all cases it was found to be harmless and unobjectionable. The committee's report concludes that the manufacture of sugar from starch is a long-established industry, "scientifically valuable and commercially important; that the processes employed in the United States are unobjectionable and leave the product uncontaminated; that the starch sugar thus made and sent into commerce is of exceptional purity and uniformity of composition, and that, although it has less sweetening power than cane sugar, yet starch sugar is in no way inferior to cane sugar in healthfulness, there being no evidence before the committee that it has any deleterious effect upon the human system, even when taken in large quantities."

GLUE, MARINE, a cementing composition used in ship-building, for covering seams in ships' decks after being calked. In hot climates it is preferred to tar for this and other purposes, where the materials are exposed to the influence of the wet. It consists of India-rubber cut very small, and digested at a gentle heat in a closed vessel with coal-tar naphtha until it is dissolved, when powdered shellac is added, and the digestion continued until it is also dissolved.

GLUME, a term applied to certain bracts in grasses and sedges (which are sometimes conjoined as *Glumisferæ*).

GLYCOSMIS, a genus of the natural order *Aurantaceæ*, trees of the East Indies. The fruit of *G. citrifolia* is delicious.

GMEIINA, a genus of verbenaceous trees. The timber of *G. arborea* (Koombar or Goombar of Italy) resembles teak, but is closer in grain, and lighter.

GMUNDEN, a town of Upper Austria, 159 miles west of Vienna by rail. It lies 1,439 feet above sea level, amid the grandest scenery of the Salzkammergut, at the lower end of the Traunsee, or Lake Gmunden, above which towers the Traunstein. With numerous hotels and villas it is a favorite summer bathing-place. Salt mines employ many of the inhabitants. Population, 6,631.

GNEIST, RUDOLF, a German jurist, born at Berlin in 1816. He studied jurisprudence at Berlin. In 1841 he was made assessor in the superior court (*Kammergericht*), and was successively assistant judge of the same court and of the supreme tribunal, until in 1850 he resigned these positions in order to devote himself exclusively to teaching law. From 1858 to the present time, he has been a member of the Prussian Lower House; in the Imperial Parliament he has sat from the first. In 1875 he was called to the bench as a senior judge of the Supreme Court of Prussia and a member of the Privy Council. In the Prussian Chamber of Deputies, acting with the National Liberals, and in the Imperial Parliament, he has advocated a greater amount of self-government of the people, more attention to the welfare of the working classes, and reform of the judicial and penal systems, and the adoption of more liberal usages, like those in England. His writings deal chiefly with constitutional law in England and Germany, with politico-historical subjects, and with current questions of practical politics in Germany.

GOAT ISLAND, an island 70 acres in area, which divides the current of Niagara River just above its falls. It is 900 feet from the American shore, with which it is connected by a bridge.

GOAT-MOTH (*Cossus ligniperda*), a large moth common throughout Europe and Asia. It measures three inches across the wings, and has a thick heavy body. The general color is yellowish-gray;

the upper wings mottled with white and marked with black lines, the lower of a more uniform ash-color. The caterpillar when full grown is about three inches long and has a yellowish color. It inhabits and feeds on the wood of willows, poplars, and elms, often destroying the tree. It takes two or three years to attain maturity. The pupa is inclosed in a cocoon of chips cut by the jaws of the creature. The caterpillar has been regarded by some as the *Cossus* of Roman epicures, but this was more likely the larva of some large beetle.

GOAT'S BEARD (*Tragopogon*), a genus of plants of the natural order *Compositæ*. The common Goat's Beard (*T. pratensis*), also known by the name *Go-to-bed-at-noon*, is an erect biennial plant, an abundant native of Britain. The roots, if taken before the flower stems shoot up, and boiled, resembles asparagus in flavor, and are said to be nutritious. In some parts of France the fresh juice of the young stems and leaves is believed by the common people to be an excellent solvent of bile. Salsify (*T. porrifolium*), also a native of Britain, is cultivated in gardens for the sake of its esculent roots, which are esteemed by some.

GOAT'S RUE (*Galega*), a genus of plants of the natural order *Leguminosæ*, of which one herbaceous perennial species (*G. officinalis*) is sometimes cultivated like lucerne (especially in Switzerland) as a forage plant, on account of the great bulk of produce which it yields. Its peculiar smell is not relished by cattle unaccustomed to it. It was formerly employed in medicine.

GOBAT, SAMUEL, bishop of the Protestant Church at Jerusalem, born at Cremine in Switzerland in 1799, died at Jerusalem, May 12, 1879. In the Mission-house at Basle he prepared himself for the work of a missionary from 1821 to 1824. After studying Arabic and Æthiopic in Paris he entered the service of the Church Missionary Society, and was sent to Abyssinia. But as that country was in a state of war, he stopped at Cairo for three years. In 1830 he was allowed to enter Abyssinia, and soon gained the good-will of some of the prominent inhabitants. They gladly received from him an Amharic translation of the Gospels. On the renewal of the war in Abyssinia he returned to Europe. A second missionary journey, undertaken in 1835, was fruitless on account of his severe illness. In 1839 Gobat became principal of the Missionary College at Malta, where he translated the Bible into several Oriental languages.

GOBBE, or **VOANDZON** (*Voandzeia subterranea*), a leguminous annual of tropical Africa (sub-order *Cesalpineeæ*), of which the young pod is thrust into the ground in the same manner as that of *Arachis hypogæa* (the ground-nut), thus at once protecting and planting the seeds. The rich oily seeds ("Angola peas") are wholesome and agreeable when boiled. The young pods also are used like French beans.

GOBINEAU, JOSEF ARTHUR, COMTE DE, a French diplomatist and author, born at Bordeaux in 1816. His first diplomatic service was as secretary of the French legation at Berne, in 1851. He was next sent as ambassador to Persia in 1861, to Greece in 1864, to Brazil in 1869, to Sweden in 1872, and in 1877 he resigned and retired. Gobineau was very much given to study wherever he found himself. Besides his literary pursuits he was also active in various philosophic and philanthropic endeavors. He died in 1882.

GOBLET, RENÉ, born at Air-sur-la-Lys, France, Sept. 26, 1828. In 1871 he was elected to the National Assembly where he identified himself with the Republican Left. In 1879 he was appointed under secretary of state for justice; in 1882, min-

ister of the interior in M. de Freycinet's cabinet; in 1885, minister of education and public worship in the cabinet of M. Brisson; later in the same year, appointed to the same post by the new prime minister, M. de Freycinet. In December 1886, M. Goblet became prime minister. M. Goblet is a progressive Republican.

GODESBERG, a village of Rhenish Prussia, on the Rhine, four miles south of Bonn. It has a mineral spring, and a picturesque ruined castle (1213). Population, 2,901.

GODERICH, a port of entry and chief town of the county of Huron, Ont., Can., situated on Lake Huron, at the terminus of the Buffalo and Goderich division of the Grand Trunk Railway, 78 miles northwest of London. It has a good harbor, and communicates by steamer with the various lake-ports. It has eight valuable salt-wells, extensive lake fisheries, and manufactories of woollens, machinery, boots and shoes, etc. Population, 4,564.

GODDARD, ARABELLA, pianist, was born near St. Malo, in Brittany, in 1836, and received lessons from Kalkbrenner, Thalberg and Macfarren. She made her début at the grand national concerts in London in 1850, and in 1854-56 performed with great success in the principal cities of France, Germany and Italy. In 1860 she married Mr. Davison, a musical critic. She took her farewell of the British public in 1873, and then made a tour to Australia, the Sandwich Islands and the United States, returning to England in 1876.

GODFREY, THOMAS, born in Bristol, Pa., in 1704, died in Philadelphia in December, 1749. He worked as a glazier, and studied mathematics, acquiring Latin in order that he might read mathematical works in that language. In 1780 he made an improvement in Davis's quadrant, which, after considerable delay, was laid before the Royal Society of London. A similar invention was about the same time presented by John Hadley, the vice-president of the society, and both claimants being declared entitled to the honor of invention, each received a prize of £200. The instrument is called Godfrey's or Hadley's quadrant, and is still in general use.

GODKIN, EDWIN LAWRENCE, an American journalist, born in 1831. He was a correspondent of the London "News" in Turkey and Russia in 1854-56, and then came to the United States. He was admitted to the New York bar in 1859, and from 1862 to 1865 was correspondent of the "News" and an editorial writer for the New York "Times." In the latter year he became editor of "The Nation," and in 1881, when it was made the weekly issue of the "Evening Post," Mr. Godkin became an editor and proprietor of the joint publication. He wrote a *History of Hungary, A. D. 300-1850* (1856); and a work on *Government in the American Science Series* (1871).

GODMAN, JOHN D. (1794-1830), an American physician. In 1818 he graduated in medicine at the University of Maryland, and then practiced in Philadelphia. In 1821 became professor of surgery in the Medical College of Ohio, and began the publication of the Cincinnati "Western Quarterly Review." In 1822 he returned to Philadelphia, and two years later became an editor of the "Philadelphia Journal of Medical Sciences." In 1826 he was made professor of anatomy and physiology in Rutgers Medical College, New Jersey, but resigned the following year on account of failing health. He wrote many articles for various periodicals, and published several works on natural history, anatomy, and other subjects. He also made a translation of Levasseur's *Account of Lafayette's Progress Through the United States*.

GÖDÖLLÖ, a market-town of Hungary, fifteen miles northeast of Pesth, with a royal castle and park presented by the Hungarians in 1867 to their king, the emperor of Austria-Hungary. Here, April 7, 1849, the Austrian forces were defeated by the Hungarians. Population, 3,940.

GODON, SYLVANUS WILLIAM (1809-79), a United States naval officer. He was appointed midshipman in 1819, was promoted lieutenant in 1836, commander in 1855, and captain in 1861. He took part in the attack on Port Royal under Admiral DuPont; in 1863 was promoted commodore, and commanded the 4th division of Admiral Porter's fleet at both bombardments of Fort Fisher. At the close of the war he was made rear-admiral. He commanded the South Atlantic Squadron in 1866-67, and was commandant of the Brooklyn navy-yard in 1868-70. In 1871 he was retired on account of age.

GOD'S TRUCE. In the 9th and 10th centuries, when the empire of Charlemagne had begun to break into small fragments, the right of private war and private vengeance threatened to cause anarchy and dissolution instead of being a rough and ready method of enforcing equity between man and man. Accordingly, the church stepped in, and at the end of the 10th century formulated stern penalties against all who, while waging feudal war, should violate the peace. The God's Truce, technically speaking, was a mutual agreement, sanctioned by the church, on the part of the barons and nobles of a particular district, to abstain altogether from private war at certain fixed times, and to respect permanently the rights of those who followed purely pacific callings. This movement was first set on foot at a synod held at Tuluges, in Roussillon, in 1027. Fourteen years later it spread from the whole of France into Germany, Italy, Spain and England. About 1041 the main provisions of the Peace of God (*Trenga Dei*) were these: Peace was to last from Wednesday evening to Monday morning each week, also during Advent and Lent, and on certain of the principal saint's days and holy days of the church; the punishments for disobedience were money fines, banishment for a long term of years, and excommunication. The Peace of God was confirmed by several councils of the church, more especially by that of Clermont (1095), when Urban II proclaimed its universal extension throughout Christendom. During the course of the 13th century this institution fell into desuetude, its place being taken by the stronger executive of the kings.

GODWIN, PARKE, an American editor, born in 1816. He was admitted to the bar, but never practiced. From 1837 to 1853, excepting one year, he was connected with the New York "Evening Post," and in 1843 issued the "Weekly Pathfinder." He contributed largely to the "Democratic Review," and was also an editor of "Putnam's Monthly." In 1865 he again became connected with the "Evening Post." He wrote *Popular View of the Doctrines of Charles Fourier* (1844); *Construction Democracy; Yala, a Mythological Tale* (1851); *A Handbook of Universal Biography* (1851); *History of France* (1861); *Out of the Past* (1871), and an edition of Bryant's writings, with a life (1883-84).

GOETTLING, KARL WILHELM, German philologist and historian, born at Jena in 1793, died Jan. 20, 1869. He was educated at Jena and at Berlin; in 1815 became professor in the gymnasium at Rudolstadt, in 1819 director of the gymnasium at Neuwied; in 1822 professor extraordinary, and in 1832 professor in the University of Jena. He visited Italy, Sicily, and Greece in connection with his archaeological and historical studies.

GOFF, NATHAN, born in Clarksburg, W. Va., Oct. 9, 1843. Educated at the University of New York in 1861 he entered the U. S. army and in 1863 was appointed major of the 4th Virginia cavalry. Serving a term in the West Virginia Legislature and acting as district attorney from 1868 to 1881, he resigned the latter office to accept the secretaryship of the navy, vacated by Richard W. Thompson. Mr. Goff was a member of Congress, as a Republican, 1884-1888, and in 1892 was appointed judge of the Circuit Court of Appeals.

GOFFE, WILLIAM (1605-79). In 1647 he joined the army, and in 1655 became a major-general. In 1654 and 1656 he was sent to Parliament, and Cromwell appointed him to a seat in his House of Lords. He was one of the judges who signed the death-warrant of King Charles I. Before the restoration of Charles II., Gen. Goffe and Gen. Edward Whalen arrived in Boston, and when the king offered a liberal reward for their arrest they were compelled to conceal themselves. In 1675 Goffe suddenly put himself at the head of the citizens of New Haven who were attacked by Indians. He led them to victory, and disappeared as quickly as he had come.

GOFFSTOWN, a manufacturing village of Hillsborough county, N. H. Population, 1,981.

GOHANUH, a town of India, in the Bengal presidency, 50 miles from Delhi. Population, 6,668.

GOLCONDA, the county-seat of Pope county, Ill., on the Ohio River. Farming, mining, and manufacturing are the chief occupations of the vicinity. There are several mills and a lead and a kaolin mine. Population, 1,174.

GOLD (see *Britannica*, Vol. X, pp. 740-53) is the most ductile and malleable metal, almost as soft as lead, and on account of its brightness, scarcity, beautiful yellow color, and the facility with which it can be wrought into ornaments, has always been held in the highest estimation by mankind. In its native state we find it mostly in small grains, fibers and scales, seldom in irregular lumps, called nuggets. It is sparsely disseminated through various rocks, as granite, shale, etc.; but is most abundantly found in quartz veins, which penetrate these rocks, and in beds of quartz sand and quartz pebbles. Solid gold veins are never met with. The grains of gold are embedded in the quartz rocks, except where the latter have been disintegrated. We find it most abundantly where iron pyrites prevail. It is well known that the waters of the ocean contain also gold; but the quantity is too insignificant to pay for its separation. It amounts to about one grain of gold to every ton of water, or a dollar's worth of gold for 25 tons.

Gold can only be mined where it has accumulated in fissure veins, or at the bottom of placer deposits near the bedrocks. On account of its great specific gravity, which is 19, it settles to the bottoms of the gravel beds, and is most concentrated upon their bedrocks. There its yellow glistening luster early attracted the attention of man. Until about 40 years ago, all the gold in circulation was extracted by washing the gravel, sand, and earth of placers. *Quartz-mining*, crushing and stamping the gold quartz and amalgamating the gold out of the quartz powder, is a recent invention. It began in California about 1860.

Placer-mining is principally carried on in California, Australia, on the Siberian slope of the Ural Mountains, in Georgia and North Carolina, and in some of the South American States. *Hydraulic-mining* is a Californian invention. In this mode of mining, streams of water issuing from nozzles are thrown against banks of earth containing gold, and the earth thus disintegrated is washed into sluices where the gold particles are caught. Noz-

zles have been used as large as six to eight inches in diameter; and water under heads of 200 to 300 feet has been thrown by these nozzles. Such streams have an incredible power. If we try to strike a crowbar or an ax through the stream a few feet from the nozzle, we find it impossible to do so, as the stream behaves like a solid bar of iron. If a man is hit by such a stream, even at 20 or more feet from the nozzle, he will be instantly pounded into a shapeless mass. It will throw boulders of 1,000 pounds weight to a distance of 200 feet, as boys throw balls. With such streams directed against a bank of dirt and gravel, the bank is very soon hollowed out by the water and made to cave in. Whole hills have been washed down in this way.

In Nevada, where water is very scarce, people are anxious to find a way of extracting the gold particles contained in the loose dirt on the hills without the use of water. It has often been tried by a winnowing process. Blasts of air have been driven through the dry dirt, and the heavier gold made to settle down, while the sand and dirt particles were blown away. Although gold was obtained by this method, yet it could never be made to pay.

Quartz-mining is carried on in the same countries where placer mining is done. In some cases, as, for instance, in the mines of the Forbes Reef Mining Company, in Transvaal, South Africa, the drilling of the blast holes is accomplished by drills worked with electric motors. Dynamos are driven by a water-fall situated five miles away, and the electric current is brought to the mines by wires stretched on posts. In the Comstock and other mines around the Sutro Tunnel, Virginia City, Nev., the stamps used for crushing the ore containing gold and silver are also worked by several electric motors. A great fall of water at the end of the Sutro Tunnel drives a number of water wheels; and these, in their turn, drive several dynamos, the currents from which are conducted by wires to the electric motors at the stamp mills.

For amalgamating the ground ore an apparatus similar to the Hungarian mill is used. But recently the "hydrogen amalgam process" of extracting gold from ground ore and tailings has been introduced. It consists in placing the mercury in a pan having a flat disk floating on the mercury. This surrounds a porous pot. The ground ore, with water, is fed in between the porous pot and the disk. A circular motion is given to the disk, so as to spread the ore through the mercury. In the porous pot there is a solution of sodium sulphate. An electric current is passed into the apparatus, the quicksilver being made the cathode. This current develops hydrogen over the quicksilver, and this hydrogen cures its tendency to "sicken;" that is, to oxidize and become ineffective. It is claimed that 40 per cent. more gold can be extracted from the ore by this process than by the ordinary way of amalgamating, and that the waste of quicksilver is prevented.

The yearly product of the gold mines in the United States averages about \$40,000,000; and that of the entire world is not far from \$100,000,000 at this time.

GOLDAU, formerly a small town of Switzerland, in the canton of Schwyz, memorable for its destruction by a stupendous landslide, Sept. 2, 1806. In a few minutes not only Goldau, but the neighboring villages of Busingen, Röthen and Lowerz were overwhelmed, and a part of the Lake of Lowerz was filled up, by the fall of the upper slope of Mount Rossberg. The valley is now a wild, rocky waste, overgrown with grass and moss. The village of New Goldau, on the line of the Rigi railway, consists of but a few houses.

GOLD-BEATER'S SKIN, a very thin but tough membrane placed between the layers of gold during the process of beating. It is prepared from the great intestine of the ox (see *Britannica*, Vol. X, p. 753), and besides its application in gold-beating is used in the dressing of slight wounds.

GOLDEN, the county-seat of Jefferson county, Col., containing a college, State school of mines, flour and paper mills, smelting-works, foundry and coal mines. Population (1890), 2,383.

GOLDEN BEETLE, the name popularly given to many members of a genus of coleopterous insects, *Chrysomela* and of a sub-family, *Chrysomelidae*, belonging to the tetramerous section of the order. The body is generally short and convex, the antennae simple and wide apart at the base. None of the species are of large size, but many are distinguished by their metallic splendor of color. The finest species are tropical. See *Britannica*, Vol. VI, p. 134; and Vol. XIII, pp. 149-50.

GOLDEN-EYE FLY (*Chrysopa perla*), also called lacewing fly, a neuropterous insect of a pale green color, with long thread-like antennae, long gauze-like wings, and brilliant golden eyes. Its flight is feeble. The length from the tip of the antennae to the tip of the wings, is almost an inch and a half, but the insect without wings and antennae is not more than one-third of this. The eggs have been mistaken for fungi. The larvae, called aphidions, are useful in destroying aphides. The pupa is inclosed in a white silken cocoon, from which the fly is liberated by a lid.

GOLDEN-ROD (*Solidago*), a genus of plants of the natural order *Compositae*, closely allied to *Aster*. Only the *S. Virga-aurea* is British, but more than 100 species belong to North America, where their bright coloring lightens up the beautiful autumnal scenery. *S. Virga-aurea* had at one time a great reputation as a vulnerary, whence probably the name (from Lat. *solidare*, "to unite"). The leaves of this and a fragrant North American species, *S. odora*, have been used as a substitute for tea. They are mildly astringent and tonic.

GOLD-EYE, or MOON-EYE (*Hyodon tergisus*), a peculiar fish, abundant in the western rivers and lakes of North America. It has many technically interesting peculiarities of structure, and forms a family by itself in the Physostomi order of bony fishes. It measures about a foot in length.

GOLD HILL, a town of Nevada, 7,000 feet above the sea, and a mile south of Virginia City, with rich silver mines, and quartz-mills. Here, on Mount Davidson, is the famous Comstock Lode. Pop., 4,531.

GOLD OF PLEASURE, or FALSE FLAX, the *Camelina sativa*, an annual plant of the order *Cruciferae*, growing in Europe, and sparingly in the United States. Its fibers can be used for the manufacture of coarse fabrics, and it is sometime cultivated for the oil of its seeds.

GOLDSBORO, a city and county-seat of Wayne county, N. C. It is a railroad center, is on the great Southern thoroughfare of travel, has a female college, and a population of 4,017.

GOLDSBOROUGH, LOUIS MALESHERBES (1805-78), a U. S. naval officer. He entered the navy as midshipman at seven years of age and at twenty was appointed lieutenant. In 1827 he received the thanks of the English government for the rescue of the brig *Comet*, which had been captured by Greek pirates. During the Seminole war he commanded a company of volunteer cavalry, and in 1847 was executive officer of the frigate *Ohio*, which bombarded Vera Cruz. In 1849 he was senior member of the commission to explore California and Oregon, and in 1853-57 was superintendent of the U. S. Naval Academy. In 1861 he became flag-

officer, and was placed in command of the *Minnesota*. He was made rear-admiral in 1862, and in 1865 commanded the European squadron. In 1873 he was placed on the retired list, after a longer service and more active duty than any other naval officer then living. He died February 20, 1878.

GOLDSCHMIDT, MADAME JENNY MARIA LIND, a celebrated Swedish singer, born at Stockholm, Oct. 6, 1820, died near Malvern, England, Nov. 2, 1887. Her father was a teacher of languages. When only three years old, she could sing any piece she had ever heard. At nine she was admitted to the singing school attached to the court theater. Soon afterwards she played juvenile parts on the stage, showing considerable dramatic ability. At eighteen she appeared in the role of Agatha in *Der Freischütz*, Alice in *Robert le Diable*, etc., and soon became the prima donna of the Royal Theater, Stockholm. In 1841 she went to Paris to receive lessons from Garcia, who did not encourage her at first. But Meyerbeer, who heard her once, prophesied a brilliant future for the young singer. Jenny's voice was thought to be wanting in volume, and when she appeared at the Grand Opera two years later, her failure discouraged her so that she resolved never again to sing in France.

In 1844 she went to Berlin, where she studied German. Returning to her native city, Jenny was heard with enthusiasm in *Robert le Diable*. Upon Meyerbeer's recommendation she was engaged at Berlin in October, appearing in *Norma*, and Meyerbeer's operas. In 1846 she visited Vienna; in 1847 London. Prices at her Majesty's theater rose to a fabulous height, and "the town," says Chorley, "sacred and profane went mad about the Swedish Nightingale." She selected the part of Alice, which had first shown the sweetness of her voice. Her soprano voice was at that time very thrilling and sympathetic. She warbled like a bird. On May 18, 1849, she sang on the London stage for the last time in *Roberto*. After that her appearances were confined to the concert-halls.

In September, 1850, she came to America under the auspices of P. T. Barnum. Her share of the profits of a brilliant tour in this country amounting to \$300,000, she afterwards spent in founding and endowing musical scholarships and charities in Sweden and England. Her first concert in New York was accompanied by scenes of the wildest enthusiasm. The seats were sold at auction, and hundreds of dollars bid for the best choice. After giving about one hundred concerts in the principal American cities, she married, at Boston, Mass., Otto Goldschmidt, who had accompanied her as pianist. Returning to Europe she continued to sing at concerts and in oratorios, as in London (1856), and for the last time at Düsseldorf in 1870. Her English charities included the gift of a hospital to Liverpool, and of a wing of another to London. Her voice retained its sweetness to the last, but she only sang occasionally in London drawing-rooms, except at the Royal College of Music, where she was professor of singing from 1883 till 1886. Jenny Lind's moral character was pure and elevated, and her feelings deeply religious.

GOLD STICK, a title given in England to the captain of the Gentlemen-at-Arms, and to the colonel of the Life Guards, who bear gilded rods on occasions of state.

GOLD-THREAD, the popular name in America for *Coptis trifolia*, a ranunculaceous plant, found from Denmark to Siberia, and over the North American continent through Canada into the United States. It is a small creeping plant, the leaves somewhat like those of the strawberry, but

smaller, and evergreen under the snow. The flowers are small and white. The name "gold-thread" is given to the abundant silk-like root-stocks which the plant produces. It was a popular remedy with the Indians of the Northern United States and Canada for sore mouths and ulcerated throats. The French Canadians use it often for these maladies, little bundles of the roots being often sold in the French markets of Montreal under the name of *Tissa voyanne jaune*. The Indians made a dye from the stems and leaves, by which they colored skins of animals a saffron yellow.

GOLFO DULCE, a lake of Central America, in Guatemala, forming the principal water-way of that State to the Atlantic. It is 25 miles long, 10 miles broad, and communicates with the Gulf of Honduras by a small stream. The entrance into the river is impeded by a bar, but the river itself and the lake have considerable depth.

GOLIAD, the capital of Goliad county, Texas, situated on the north bank of the San Antonio River, about 90 miles southeast of the city of San Antonio. It is the seat of Aransas College. It has a salubrious climate, and is surrounded by rich lands. Pop. (1890), 2,000.

GOLIATH BEETLE, an immense cetonian lamellicorn beetle of the genus *Goliathus*. *G. giganteus*, one of the largest of known coleopters, is about four inches long and two inches broad. Some of these insects are very handsome. The species is African but some related genera occurring in tropical Asia are also called goliath beetles.

GOLOMYNKA (*Comephorus* or *Callionymus baikalensis*), a remarkable fish, found only in Lake Baikal, the only known species of its genus, which comes near the gobies, but is the type of a distinct family. It is about a foot long, is destitute of scales, and is very soft, its whole substance abounding in oil, which is obtained from it by pressure. It may be almost said to melt into oil on the application of fire. It is never eaten.

GONAIVES, a seaport of Hayti, on a beautiful bay on the west coast, with an excellent harbor, 65 miles north-northwest of Port-au-Prince. It exports coffee, cotton, logwood, and hides. Population (1887), 18,000.

GONIATITES, a genus of fossil cephalopodous mollusca, belonging to the same family as the ammonites. The septa are lobed, but without lateral denticulations, as in ammonites. The siphonal portion is shorter than the sides, forming a sinus at the back, as in the *Nautilus*. The last chamber, tenanted by the animal occupies a whole whorl, and has a lateral expansion. The shells are small. This genus is confined to the Paleozoic strata; nearly two hundred species have been described from the Devonian, Carboniferous, and Triassic systems.

GONFALON (Ital. *gonfalone*), or GONFANON, an ensign or standard, in virtue of bearing which the chief magistrates in many of the Italian cities were known as *gonfalonieri*, standard-bearers of the church.

GONZALES, the county-seat of Gonzales county, Texas, on Guadalupe River, and one of the oldest towns of the State. It is the seat of Guadalupe College. Pop., 1,641.

GONZALEZ, MANUEL, born in Mexico in 1820; became a guerrilla leader in 1853, and was prominent in the reactionary party. In 1861-65 he assisted Juarez against the French and Imperialists, and in 1876 joined with Diaz to overthrow Lerdo de Tejada. In 1878 he became secretary of war under Diaz, whom, in November, 1880, he succeeded as president. This office he held four years, and afterward became governor of the State. Died April, 1893.

GOODALE, GEORGE LINCOLN, botanist, born in Saco, Me., August 3, 1839; graduated at Amherst, and in medicine at Harvard and Bowdoin. He held professorial chairs at Harvard and other institutions, and is a member of the council of Harvard College library and of the museum of comparative anatomy. He has written several works on botany and vegetable histology.

GOODALL, FREDERICK, artist, was born in London, England, in 1820; became A.R.A. in 1852, and R.A. in 1863. He is best known by his historical paintings and works of genre.

GOODE, GEORGE BROWN, an American ichthyologist, born at New Albany, Ind., Feb. 13, 1857; became a member of the staff of the Smithsonian Institution and from 1874 to 1887 was chief of the division of fisheries. He has been a member of many important commissions and in 1887 became fish commissioner. He is now assistant secretary of the Smithsonian Institution, in charge of the National Museum. He has written much on ichthyology.

GOODELL, WILLIAM (1792-1867), an American missionary. He graduated at Andover Theological Seminary in 1820, and two years later sailed for the Island of Malta. In 1823 he went to Beirut, and in 1831 to Constantinople. He endured many hardships, and during his twenty-nine years of missionary life, was compelled to change his residence thirty-three times. He returned to the United States in 1865. In 1843 he completed a translation of the Scriptures from the original Greek and Hebrew into Armeno-Turkish, and later contributed papers to the New York "Observer," entitled *Reminiscences of the Missionary's Early Life*.

GOODRICH, CHAUNCEY ALLEN, an American lexicographer, born in New Haven, Conn., Oct. 23, 1790, died there Feb. 25, 1860. He was a tutor in Yale College from 1812 to 1814; was pastor of the Middletown, Conn., Congregational Church in 1816-17; professor of rhetoric and oratory in Yale from 1817 to 1839; and professor of pastoral theology until his death. He contributed extensively to various periodicals, and in 1829 established the "Christian Quarterly Spectator," being its sole editor from 1836 to 1839. Besides some educational works, he edited Webster's *Unabridged Dictionary* and *Select British Eloquence*.

GOODRICH, SAMUEL GRISWOLD, an American author, best known by his pen-name, PETER PARLEY, was born in Ridgefield, Conn., August, 19, 1793, and edited in Boston an annual called *The Token*, from 1828 to 1842, to which he contributed poems, tales and essays, and in which the best of Hawthorne's *Twice-told Tales* first appeared. He published some two hundred volumes, mostly for the young, and dealing with history, geography, travels and natural history. Many of his books were reprinted, and became popular in Great Britain. He died May 9, 1860.

GOODWIN SANDS, famous sandbanks stretching about ten miles in a northeast and southwest direction at an average distance of five and a half miles from the east coast of Kent, England. Large, level patches of sand are left dry when the tide recedes, and afford a firm foothold, but when covered the sands are shifting, and may be moved by the prevailing tide to such an extent as to considerably change the form of the shoal. These sands have always been dangerous to vessels passing through the Strait of Dover, though an admirable system of lightships and buoys has robbed them of much of their danger.

GOODWIN, WILLIAM WATSON, an American scholar, born in 1831. He was a tutor at Harvard from 1856 to 1860, when he became professor of

Greek literature. He is a member of several scientific and historical societies, and has contributed to various literary and philological journals. He is the author of several works on philology and grammatical science.

GOODYEAR, CHARLES (1800-60), an American inventor. At the age of twenty-one he became a member of the firm of A. Goodyear & Sons, manufacturers of steel hay-forks; but in 1830, through the failure of Southern houses, the firm was compelled to suspend. From that time until his death Mr. Goodyear was engaged in experimenting with India rubber. In 1844 he obtained his patent for vulcanized rubber, and he lived to see his material applied to nearly 500 uses, and to give employment to more than 60,000 persons.

GOOKIN, DANIEL (1612-87), an American soldier. He came to Virginia in 1821, and in 1844 removed to Cambridge, Mass. He was appointed a captain of the militia and a member of the house of deputies; was speaker of the house in 1651; was chosen magistrate in 1652; and in 1656 was appointed superintendent of all the Indians acknowledging the government of Massachusetts, retaining the office until his death. In 1681 he became major-general of the colony. He wrote *Historical Collections of the Indians of Massachusetts* (published posthumously); and a *History of New England*, which was lost and never published.

GOOSE. See *Britannica*, Vol. X, pp. 777-79.

GOOSEBERRY. See *Britannica*, Vol. X, pp. 779-80.

GOOSE LAKE lies partly in Jackson county, Oreg., and partly in Siskiyou county, Cal. It is 30 miles long and 10 miles wide, and at the southern end has an outlet called Pitt River.

GOPHER WOOD. The probable identity of the gopher wood of Scripture with the cypress is maintained partly on account of the qualities of the wood and partly on account of the agreement of the radical consonants of the names.

GORAL, a kind of goat antelope, *Nemorhædus goral*, inhabiting the rocky heights and lofty tablelands of India. It is of a grayish-brown color, dotted with black, the cheeks and throat white; the horns are short, inclined, recurved, and pointed. It is a wild and fleet animal, hunted for its excellent flesh.

GORDON, CHARLES GEORGE, a British general, best known as "Gordon Pasha," born at Woolwich in 1833, died in 1885. In 1847 he entered the military academy at Woolwich, and in 1852 the Royal Engineers. At Sebastopol, where he fought in the trenches, he was slightly wounded. Subsequently he was engaged in surveying the new frontier between Turkey and Russia in Europe and Asia. In 1860 Gordon went to China, and took part in the capture of Peking and the destruction of the summer palace there. In 1863 he was appointed to the command of a Chinese force officered by Europeans and Americans, and was for two years engaged against the Taiping rebels. He fought 33 actions in two campaigns, took numerous walled towns, and crushed the formidable rebellion which had so long wasted the fairest provinces of China.

Returning from China in 1865, "as poor as when he had entered it," he performed engineer duties at Gravesend till 1872, when he went to Bulgaria as commissioner. In 1873 Khedive Ismail of Egypt employed him to open up the regions of the equatorial Nile and the lakes which recent explorations had discovered, a work formerly begun by Sir Samuel Baker. Gordon was appointed governor of the equatorial provinces, and in February, 1874, he marched with 2,000 Egyptian and negro troops to Gondokoro, on the White Nile. Here he established

a chain of fortified posts as far as the great equatorial lakes. He aimed at the suppression of the slave-trade which had formerly been the one great object of Soudanese commerce. The Khedive supported his efforts, raised him to the rank of pasha, and made him governor of all Soudan in 1877.

In 1879, when the new Khedive, Tewfik, failed to support him, Gordon resigned his position and returned to England, where he was greeted with great enthusiasm. After a brief holiday in Switzerland he was sent to Mauritius as commanding royal engineer. Afterwards he was appointed major-general, and had command of the British troops in Cape Colony till 1882. Early in 1884 the British government asked him to proceed once more to the Soudan, where the Moslem populations had risen in revolt, and defeated the Egyptian armies and isolated the Egyptian garrisons. A month after Gordon reached Khartum, this place was invested by the troops of the Mahdi, the leader of the Soudanese revolt. A relief expedition was organized in England, but reached the Soudan too late. The town of Khartum had been taken by the Mahdi two days before the expedition arrived. Gordon had fallen after a brave resistance of many months. The journal he left behind reveals wonderful courage, faith, resolution, and humility—a true Christian hero. He was treacherously slain by an Arab.

GORDON, JOHN B., United States Senator from Georgia, a lawyer, born in Upson county, Ga., Feb. 6, 1832. He was educated at the University of Virginia, served in the Confederate army, being promoted from captain up to major-general, and was eight times wounded in battle. In politics a Democrat, he was a Presidential elector in 1868 and 1872, and a delegate to the National Democratic conventions of those years. In 1872 was elected by the State legislature to the United States Senate to succeed Joshua Hill. He resigned in 1880, became State railroad commissioner, and was governor of Georgia from 1886 to 1890. In 1890 he was elected to the United States Senate to succeed Joseph E. Brown, and was re-elected in 1891.

GORDON, SIR ARTHUR HAMILTON, a British colonial governor, born at Aberdeen in 1829. After graduating at Cambridge University, he served as private secretary to his father, the fourth earl of Aberdeen, who was minister 1852 to 1855. In 1854 Sir Arthur became a member of Parliament for Beverly. In 1858 he was attached to Mr. Gladstone's mission to the Ionian Islands. Since 1861 Sir Arthur has been governor of New Brunswick, Trinidad, Mauritius, and of the Fiji Islands (1875), then just made into a British colony. In 1880 he was made governor of New Zealand, and governor of Ceylon in 1883. He displayed great administrative abilities in all these positions.

GORDONIA, a genus of plants of the natural order Ternstroemiaceæ. *G. Lasianthus*, the Lobloily Bay, which cover considerable tracts of swampy coast in the Gulf of Mexico, is a handsome tree (fifty to sixty feet), with evergreen leaves, and large white fragrant flowers. The bark is used in tanning.

GORDONSVILLE, a village of Orange county, Va., on the Chesapeake and Ohio Railroad, at its junction with the Virginia Midland and Great Southern Railroad, 87 miles southwest of Washington, D. C. Pop., 962.

GORGEI, ARTHUR, the commander-in-chief of the Hungarian forces during the revolt of 1849, born in 1818. In 1848 he distinguished himself by compelling Jellachich's Croatian reserve of 10,000 men to capitulate to him. In March, 1849, he was made commander-in-chief. In August he was nomi-

nated dictator in Kossuth's stead, and shortly afterward surrendered his army of 24,000 men, the last of the Hungarian forces in the field, to the Russian commander. Gorgei himself was imprisoned for some time at Klagenfurt, in Carinthia, but eventually set at liberty. In 1868 he returned to Hungary, and in 1884 was presented with an address by 260 of his old companions in arms.

GORGES, SIR FERDINANDO (1665-1647), a proprietor of Maine. During the war with Spain he served in the English army, and in 1604 became governor of Plymouth. He then became interested in the colonization of the New World, and formed a company for that purpose. After several unsuccessful attempts at settlement the council resigned its charter, and in 1639 Gorges obtained a new charter, which constituted him lord-proprietary of the province of Maine. He divided it into two counties, and these were further divided into hundreds and parishes. In 1840 he sent his nephew, Thomas Gorges, to Maine as deputy-governor. Sir Ferdinando died at an advanced age, and his territorial rights had been more a source of expense than of profit.

GORGONIA, a genus of corals of the Alcyonarian type, in which the colony of polypes forms a branched but flattened growth, supported by an internal axis of horn (*cornein*), originally derived from the bases of the polypes. The genus, which includes over a score of widely distributed species, is nearly allied to the black coral (*Plexaura antipathes* of the Red Sea and Indian Ocean), from whose black horny axis ornaments are often made; and to the sea-fan (*Rhipidogorgia flabellum*), whose much-branched fan-like skeleton is often brought as a curiosity from the West Indies.

GORHAM, a village of Coös county, N. H., situated on the Androscoggin River and on the Grand Trunk Railroad, 91 miles northwest of Portland, and about ten miles northeast of Mount Washington. It has fine scenery, and is a favorite place of summer resort. Pop., 1,710.

GORY DEW, a dark-red slimy film, sometimes seen on damp walls and in shady places. Its appearance on the whitewashed walls of damp cellars, etc., is apt to occasion alarm from its resemblance to blood. It is one of the lowest forms of vegetable life—an alga of the group *Palmellaceæ*, and allied to the plant to which the phenomenon of red snow is due. Its botanical name is *Porphyridium cruentum* (*Palmella cruenta*).

GORTON, SAMUEL, founder of the sect of Gortonians or Nothingarians, born at Gorton, England, about 1600, died in Rhode Island in 1677. He was for a time employed by a linen-draper of London, but in 1636 sought religious freedom in Boston, Mass. Becoming involved in disputes, he removed to Plymouth, was accused of heresy and expelled from the colony; went with a few followers to Aquidneck (now Newport), R. I., and was there publicly whipped for treating the magistrates with contempt. He then settled at Pawtuxet, R. I., but again became involved in disputes with the colonists, and in 1642 removed to Shawomet (now Warwick), R. I., where he purchased land of the Indians. His claim to the property was contested; he and his ten followers were taken to Boston, tried as heretics, and sentenced to imprisonment and hard labor, but the sentence was afterwards commuted to banishment. Gorton then went to England, procured an order giving him possession of the lands at Shawomet, returned there, and subsequently became a preacher and magistrate of much consideration. His sect survived him for nearly one hundred years. He published several religious works.

GORTSCHAKOFF, PRINCE ALEXANDER MICHAEL-OVITCH (1798-1883), a Russian statesman. In 1854-56 he was ambassador at Vienna, and then became minister of foreign affairs. In 1863 he was appointed chancellor of the empire, and from this time until the ascendancy of Bismarck he was the most powerful minister in Europe. In 1882 he retired from public life and went to Baden-Baden, where he died.

GOSCHEN, GEORGE JOACHIM, an English statesman, born in 1831. In 1863 he entered Parliament, as a Liberal, for the city of London, and in 1866 he entered the cabinet; in 1868 he became president of the poor-law board, and in 1871 head of the admiralty, holding the latter post until 1874. In 1878 he represented Great Britain at the international monetary conference held at Paris. In 1887 he took his seat as a Liberal-Unionist and accepted the chancellorship of the exchequer, which he resigned in 1892. In 1890 his budget proposals in connection with licensing were warmly opposed by the Liberals.

GOSHEN, a city and county-seat of Elkhart county, Ind., midway between Chicago and Toledo. Elkhart River furnishes abundant water-power, and great quantities of lumber are manufactured here. There are flour mills, a woolen mill, oil mill, and plow factories. Pop. (1890), 6,033.

GOSHEN, a railroad junction, and one of the county-seats of Orange county, N. Y. Dairying is the chief business. Pop., 2,907.

GOSNOLD, BARTHOLOMEW, an English navigator, who first became known as an associate of Raleigh in his unsuccessful attempt to found a colony in Virginia. In 1602 he sailed from England with one ship and twenty colonists; steered directly across the Atlantic; entered Massachusetts Bay; discovered and named Cape Cod; stopped at an island now known as No Man's Land, and planted his colony on Cuttyhunk; but the colonists soon became discouraged and returned to England. Gosnold then organized a company, which settled at Jamestown, Va., in April, 1607. He died there Aug. 22, 1607.

GOSPELS. See *Britannica*, Vol. X, pp. 789-843. **GOSAMER**, a light filamentous substance, which often fills the atmosphere during fine weather in the latter part of autumn, or is spread over the whole face of the ground, loaded with dew-drops. This has been ascertained to be produced by small spiders, although it is not yet well known if the gossamer spread over the ground is produced by the same species of spider which produces that seen floating in the air, or falling as if from the clouds. The eagerness which some of the small spiders known to produce these webs show for water to drink, has led to the supposition that dew may be one of the objects of the formation of those on the ground, also that they may afford a rapid mode of transit from place to place. As to the gossamers in the air, conjecture is more at a loss; although the supposition that the spider forms them in order to shift from place to place is more probable. The spiders which produce these threads eject with great force from their spinnerets a viscid fluid which presently becomes a thread; sometimes several such threads are produced at once in a radiating form, and these, being caught by the ascending current of heated air, are borne upwards, the spider along with them. It has been said that the spider has power of guiding in the air the web by which it is wafted up.

GOSSE, EDMUND WILLIAM, an English poet and critic, born in London, Sept. 21, 1849, and educated privately. He was appointed assistant librarian at the British Museum in 1867; translator to the

board of trade in 1875; 1884-89 Clark lecturer in English literature at Trinity College, Cambridge. In 1884-5 Mr. Gosse visited America and delivered lectures before the Lowell Institute and before Harvard, Yale, and Johns Hopkins Universities. Mr. Gosse has published several volumes of poetry; critical essays in Scandinavian, Dutch, German, and English literature; and several works in English biography and criticism.

GOSSE, PHILIP HENRY, a British zoölogist, born at Worcester, April 10, 1810, died Aug. 23, 1888. He was reared at Poole; in 1827 went to Newfoundland as a clerk, and was afterwards in turn farmer in Canada, schoolmaster in Alabama, and professional naturalist in Jamaica. Returning to England he published in 1840 the "Canadian Naturalist," and after another stay in the West Indies settled in England to a busy life of letters. He was elected a fellow of the Royal Society in 1856.

GOT, FRANÇOIS JULES EDMOND, an eminent French comedian, born at Lignerolles (Orne), October 1, 1822. After a year's compulsory service in the army, he made his first bow to a Parisian audience in 1844 at the *Comédie Française*, of which society he became a member in 1850. M. Got is most deservedly regarded as one of the greatest actors on the French stage. He excels in the representation of the leading comic parts in the old classical dramas, and has created scores of original characters in modern pieces. On Aug. 4, 1881, the Cross of the Legion of Honor was conferred on M. Got at the Conservatoire.

GOTHA ALMANAC (*Almanach de Gotha*), a universal political register, published annually at Gotha, in Germany. It was issued in the German language from 1764 to 1804, and from the latter date till the present has been published both in French and German.

GOTHAM, a parish of Notts, England, whose people were long famed for their stupidity, being termed in derision "the wise men of Gotham." The name was by Irving humorously applied to the city of New York, and the appellation is still a familiar one in the United States.

GOTTSCALK, LOUIS MOREAU, an American pianist and composer, born in New Orleans, La., May 8, 1829, died at Tijuca, Brazil, Dec. 18, 1869. He early showed marked musical ability, and at the age of twelve was sent to Paris, where he studied the piano with Hallé and Camille Stamat, and harmony with Maleden. His first appearance was made in Paris in 1845. He afterwards traveled in Switzerland and Spain, and achieved a high reputation before returning to the United States. His first appearance in this country was made in Boston. He was subsequently heard in other cities of the Union, in Mexico, and South America. Gottschalk was popular as a man and admired as an artist. Among other decorations he received the cross of the Legion of Honor and the Order of Isabella the Catholic. His numerous pieces are chiefly illustrative of Southern life.

GOUGH, JOHN BARTHOLOMEW, a temperance lecturer, born at Sandgate, Kent, England, Aug. 22, 1817, died at Philadelphia, Pa., Feb. 18, 1886. At the death of his father, in 1829, he came to the United States, and was for a time employed on a farm in Oneida county, New York; in 1831 he went to New York city, where he became a bookbinder. After some years of poverty, caused by dissipated habits, which finally reduced him to the utmost misery, he reformed and devoted himself to the temperance cause, laboring with great zeal and success. He visited England in 1853, by invitation of the London Temperance League, and lectured for two years in the United Kingdom. He was

again in England in 1857-60 and in 1878. In some of his later addresses he took up literary and social topics, and acquired a moderate fortune by his lectures. He published an *Autobiography* (1846); *Orations* (1854); *Temperance Address* (1870); *Temperance Lectures* (1879); and *Sunlight and Shadow, or Gleanings from My Life-work* (1880).

GOULBURN, EDWARD MEYBRICK, an English clergyman and author, born in 1818. In 1841 he was elected a fellow of Merton, and after holding the Oxford incumbency of Holywell he became head master of Rugby, 1850-58. In 1858 he was prebendary of St. Paul's; was chaplain to the queen, and vicar of St. John's, Paddington, 1859, and dean of Norwich, 1866-89. Among his publications are: *The Philosophy of Grammar, With Especial Reference to the Doctrine of the Cases* (1852); *Thoughts on Personal Religion* (1862); and *The Office of the Holy Communion* (1863).

GOULD, BENJAMIN APTHORP, born at Lancaster, Mass., June 15, 1787, died in Boston, Oct. 24, 1859. He graduated at Harvard in 1814, and was appointed principal of the Boston Latin School, continuing in charge until 1828. Under his administration the institution became famous for thoroughness in classical teaching. Mr. Gould was one of the first Americans to annotate classical authors, and his critical editions of Horace, Ovid and Virgil, prepared for use in the Boston school, had an extensive circulation throughout the country. In 1823 failing health compelled him to relinquish teaching, and after several years spent in European travel he returned and engaged in the importing business. He subsequently filled important offices in his native State.

GOULD, BENJAMIN APTHORP, astronomer, born in Boston, Mass., Sept. 27, 1824, graduated at Harvard in 1844, and received the degree of Ph. D. at Göttingen in 1848. Returning to America, he conducted the "Astronomical Journal" from 1849 to 1861; was director of the Dudley Observatory at Albany in 1856-59, and in 1868 was appointed to organize and direct the National Observatory at Cordoba, in the Argentine Republic. He organized an admirable series of stations throughout the country, and mapped a large part of the southern heavens. In 1885 he returned to the United States, where he received the degree of LL.D. from Harvard in 1885, and from Columbia in 1887. Dr. Gould has published valuable astronomical reports and charts, and is a member of numerous scientific societies in Europe.

GOULD, HANNAH FLAGG, an American poet, born in Lancaster, Mass., Sept. 3, 1789, died in Newburyport, Mass., Sept. 5, 1865. She began her literary career by writing for periodicals. Her poems, published in 1832-36 and 1841, were much admired both in England and America. Her life was passed quietly in the homestead at Newburyport.

GOULD, JAY, an American financier, born at Roxbury, N. Y., May 27, 1836. He early developed a taste for mathematics and surveying, and on leaving school was employed in making surveys for county maps. He was afterwards employed for a short time in lumbering, and accumulated sufficient capital to become in 1857 the principal shareholder in the bank of Stroudsburg, Pa. He now began to buy up railroad bonds, and in 1859 established himself as a broker in New York city. He was president of the Erie Railway company till 1872; afterwards invested largely in the stocks of other railways and telegraph companies, and in 1881 became interested in the elevated railroad system of New York city. In 1882, a question of his financial stability having arisen, Mr. Gould produced for

examination stock certificates in his own name having a face value of \$53,000,000, and offered to produce \$20,000,000 more if desired. In 1887 it was estimated that he controlled over 13,000 miles of railway, or nearly a tenth of the entire mileage of the country. He died Dec. 2, 1892.

GOULD, JOHN (1804-81), an English ornithologist. From an early age he interested himself in the study of natural history, and in 1824 became employed in preparing specimens for the museum of the London Zoological Society. He gave much attention to humming birds, and collected more than 2,000 specimens, illustrating 820 species. Among his publications are: *A Century of Birds From the Himalaya Mountains* (1832); *The Birds of Europe* (1837); *Birds of Australia* (1848); *The Mammals of Australia* (1859); *Monograph of The Trochilidae* (1850); *Odontophorinae, or Partridges of America* (1850); *The Birds of Great Britain* (1873); and *The Birds of New Guinea* (1875).

GOULD, THOMAS R., sculptor, born in Boston, Mass., in 1818, died in Florence, Italy, Nov. 26, 1881. He early engaged in mercantile business, and did not devote himself to art until later life, his first work being done in 1851. He followed his profession in Boston until 1868, when he went to Italy and settled in Florence. In 1878 Mr. Gould visited Boston. Among his most celebrated statues are *The West Wind*, *Cleopatra*, *Timon of Athens*, and *Ariel*. He also executed several portrait statues, and a number of busts.

GOUNOD, CHARLES FRANÇOIS, a French composer, born at Paris in 1818. He received his musical education at the Paris Conservatory, where he enjoyed the instruction of the celebrated composers Halévy and Lesueur. In 1839 he gained the prize, and was thereby enabled to go to Rome for further study. At Rome he entered a priests' seminary for the purpose of devoting himself to old Italian church music. In 1843 he returned to Paris, and became there the musical director of a church, which position he held for six years. In 1851 he produced the *Messe Solennelle*. After that he gave his attention more to secular music, producing first the lyric drama *Sappho*, and several pastorals, which were not much appreciated. But his *Faust*, which appeared in 1859, captivated the French, and in some degree also the Germans. Afterwards Gounod composed other operas, less popular than *Faust*. Among them *La Reine de Saba*; *Mireille*; *Romeo and Juliet*—all from 1862 to 1867. The war of 1870 drove him to London, but he returned to Paris in 1875. In London he produced the opera *Polyeucte*, and a cantata, *Gabia*. After his return to Paris the opera *Le Tribut de Zamora* (1881), and the oratorios *Redemption* (1882), and *Mors et Vita* (1885), have been his chief productions. He has lately been elected a member of the French Institute.

GOULD. See Britannica, Vol. XI, pp. 4-5.

GOURKO, JOSEPH VLADIMIROVITCH, COUNT, a Russian general, born in 1825. He served as captain in the infantry during the Crimean war. In 1861 he became colonel, in 1873 brigade commander, and in 1876 division commander. At the outbreak of the war with Turkey in 1877, he commanded the Russian vanguard. At the Shipka Pass he joined the Russian main army after the Turks had compelled him to retreat. At the head of a corps of cavalry he invested Plevna, where Osman Pasha maintained a gallant struggle. Gourko compelled him to surrender, Dec. 10, 1877. After this Gourko crossed the Balkans in midwinter with 75,000 men, captured Sophia, Philippopolis, etc. At the end of the Turkish war he was made general of cavalry, and in 1883 military governor of Warsaw

GOUVERNEUR, a town of St. Lawrence county, N. Y., situated on the Oswegatchie River, and on the Rome, Watertown and Ogdensburg Railroad, 36 miles northeast of Watertown. It contains a seminary and several large mills. Pop., 3,458.

GOVAN, a police burgh of Lanark and Renfrew shires, on the south bank of the Clyde, outside the municipal boundaries of Glasgow, but connected with the city by continuous rows of buildings. Its leading industry is shipbuilding.

GOVERNMENT (see *Britannica*, Vol. XI, p. 9-21), the ruling power in a political community. It governs the community by means of laws, decrees, ordinances, rules, orders, etc. Every law, decree, etc., is a command issued by the ruling power to those who are bound to obey, and every such command restricts somebody's liberties. In some of the Swiss cantons all the citizens of the state assemble on stated days, and enact then and there the laws for the community. The "Landammann" executes the laws. These are pure democracies, and represent the ideal government. In all other republics of the present day the people elect representatives to make the laws for them. A "president" or "governor" executes the laws. These are representative republics. In most European monarchies the people elect delegates to make the laws for them, and a "monarch" executes these laws. These are *constitutional monarchies*. In Russia, China, Persia, etc., the monarch makes the laws and enforces them also. These are absolute monarchies. In some of the ancient republics the nobility (aristocrats) ruled absolutely. These were oligarchies. As none of these exist now, we shall not further consider them in this article; and since pure democracies are only possible in very small communities, we shall also dismiss this form from further consideration. We have then only three forms of governments to consider: (1) The representative republic; (2) the constitutional monarchy, and (3) the absolute monarchy.

The principal republican governments are the United States, France, Switzerland, Mexico, the Central American Republics, Hayti, Colombia, Bolivia, Peru, Chili, Venezuela, Brazil, and the Argentine Republic.

The principal constitutional monarchies are the British Empire, the German Empire, the Austro-Hungarian Empire, the Kingdoms of Denmark, Sweden and Norway; Holland, Belgium, Spain, Portugal, Italy, Greece, Servia, Roumania, and in Germany the Kingdoms of Prussia, Bavaria, Württemberg and Saxony, besides several duchies and grand duchies; in Asia, the governments of Japan, Afghanistan and Beloochistan.

The principal absolute monarchies are: Russia, Turkey, Egypt, Persia, China, Abyssinia, and Morocco.

A *federal government* rules over several states united for national purposes as for common offense and defense, for establishing mutual free trade, for common representation before other governments, etc. Such governments are those of the United States of North America, of Mexico, of Colombia, of Brazil, the Swiss government, the German Empire, etc. This form secures to each portion a local government for its domestic purposes, familiar with its habits and sympathizing with its peculiar wants. At the same time, it secures to the united nation a common government sufficiently powerful for its protection against foreign nations, and clothed with authority to provide general regulations for the welfare of the whole. But the powers of the federal and state governments must be clearly defined and distinctly limited; and the citizens of such states must be polit-

ically well educated, and in order to exercise their political rights intelligently, each state of such a union must be independent in those matters which concern itself only. On the other hand, all the members of the union must be subject to the federal power in those matters which concern all the states collectively. In such matters as these, the sovereignty of each state must cease. Among the subjects included in this latter category are the making of peace and war; the sending of ambassadors and ministers to other governments and the reception of their diplomatic agents; the levying of imports, internal revenues, etc., and the maintenance of a standing army and navy, and also of a postal service. In relation to other nations a federal union forms one state only. All those rights that are not distinctly delegated to the federal power belong to the several states individually.

Every good government is divided into three departments or branches—the legislative, executive, and judicial. The constitution of the United States carries out this principle with the clearest distinctness. In the first sections of its articles I, II, and III, it is respectively declared, that "all legislative power shall be vested in a Congress of the United States," etc.; "the executive power shall be vested in a President of the United States;" "the judicial power of the United States shall be vested in one supreme court, and in such inferior courts as the Congress may from time to time ordain and establish." Each of these departments aids the other two and acts as a check upon them. Together they work out most beneficial results.

The Congress of the United States consists of a Senate and a House of Representatives. The former represents the States, for the senators are appointed by the State governments. The latter represents the people directly, because the representatives are elected by the voters of their districts. The President can veto any bill passed by the Congress. But if it afterward receives the vote of two-thirds of each house, it becomes a law in spite of the President's veto. And if any law is subsequently brought into the Supreme Court to investigate its constitutionality, the Supreme Court has the power to decide whether it is constitutional or not. All these arrangements are well calculated to prevent hasty and inconsiderate legislation.

Similar arrangements exist in the several States. After a State legislature has passed a bill, the governor of the State can veto it, but the legislature may subsequently pass it over his veto by a two-thirds vote. And if, after a bill has become a law, it is carried into the Supreme Court of the State, this court has the power to declare the law unconstitutional. These restraints upon legislation are necessary, because, under popular governments like ours, where the people are in close contact with the legislators, all the petty grievances, wants and wishes are taken to the latter for redress, and there is always danger of too much legislation, of overdoing the thing by passing numerous private or special laws to the detriment of the majority of the citizens.

Our government is often called a "government of the people, for the people and by the people." This is a figurative expression. For the "people" of the United States do not govern directly. They only elect their ruling officials very frequently; and by this means, and the public press, they exert a powerful influence over them. Nevertheless the laws and constitutions are enacted in the name of the "people." As an example, we insert here the opening words of the Constitution of the United States, which read as

follows: "We, the people of the United States, in order to form a more perfect union, establish justice, insure domestic tranquility, provide for the common defense, promote the general welfare and secure the blessings of liberty to ourselves and our posterity, do *Ordain and Establish this Constitution for the United States of America.*" This sentence gives us a clear and forcible answer to the question, "Why do people voluntarily surrender their natural liberty and equality, constitute governments and obey their commands, laws and decrees?" "The social compact" is to secure safety, tranquility, justice and the general welfare.

GOVERNMENT'S ISLAND, in Rock Island county, Ill., lies in the Mississippi River, between the cities of Rock Island, Ill., and Davenport, Iowa. It belongs to the United States Government, has fine armories and arsenals, and is connected by bridges with either shore. During the civil war it was used as a military prison. Area, 960 acres.

GOWAN, OGLE ROBERT, born in County Wexford, Ireland, in 1796, died in Toronto, Can., Aug. 21, 1876. He received a good education, and early became editor of the "Antidote," a newspaper of Dublin. Removing to Canada in 1829, he resided for a time in Escott, and afterwards in Toronto. He served with distinction against the insurrectionists of 1837-39; was a member of the Canadian Parliament (1834-41), and was for a time postoffice inspector and subsequently a license-officer in Toronto. He was the founder of the Orange lodges of North America, and was for 20 years their grand master.

GOWANDA, a village of New York on Cattaraugus Creek, the boundary line dividing Cattaraugus and Erie counties. It has manufactories of flour, agricultural implements, carriages, and cheese-boxes. Population (1890), 2,000.

GOWER, Mrs., *née* Mdle. Nordica, the *prima donna*, is an American by birth, and received her early musical education at the Boston Conservatory of Music. She afterwards proceeded to Italy to complete her training. Her chief triumph on the operatic stage has been her impersonation of the part of Marguerite in Gounod's "Faust." Mdle. Nordica married some years ago Mr. Gower, who is now deceased.

GRACE, an expression frequently used in Scripture and in theological discussion. Its distinctive meaning is the idea of *free and unmerited favor*. According to Aristotle this is the proper meaning of *charis* (*Gr.*, *grace*), even when applied to man. It is a benefit springing out of the liberality and free-heartedness of the giver, and bestowed without any hope or expectation of reward. Applied to God in the New Testament and in theology, it denotes the free outcoming of his love to man; and when man, on the other hand, is said to be in a state of grace, it implies that he is in the enjoyment of the divine love and favor. St. Paul draws a sharp contrast (Rom. xi, 6) between *charis* and *erga* (*Gr.*, *works*), as mutually excluding one another. "And if by grace, then it is no more of works: otherwise grace is no more grace. But if it be of works, then it is no more grace; otherwise work is no more work." Theologians have distinguished grace into *common or general*, and *special or particular*. *Common grace* is supposed to denote the love which God has to all his creatures, and the light of nature and conscience which they all enjoy. *Special grace* is the love which God has for his elect people, and by which he saves them from their sins.

GRACKLE, the common name of many birds of the Starling family (*Sturnidæ*). See *Britannica*, Vol. XI, p. 26.

GRADY, HENRY WOODFIN, born at Athens, Ga., in 1851; died at Atlanta, Ga., December 23, 1889. He was educated at the State University at Athens, and took a post-graduate course at the University of Virginia. He became editor of the *Rome* (Ga.) *Daily Commercial* and afterward of the *Atlanta Herald*. For some time he acted as Southern correspondent of the *New York Herald*, and, in 1880, he became part owner and managing editor of the *Atlanta Constitution*, which he conducted until his death. In December, 1886, he accepted an invitation to address the New England Society at their annual dinner. His address was received with the greatest enthusiasm and the whole country was stirred by his eloquent and impassioned plea for the New South. He became the idol of his native State. Just prior to his death, he delivered an address on "The Future of the Negro," before the Merchants' Association in Boston. He succumbed to an attack of pneumonia contracted in New York and died on his way home. A handsome monument was erected in Atlanta, Ga., to his memory.

GRÄFENBERG, a village in the northwest corner of Austrian Silesia. It is celebrated as the spot where the water-cure was introduced in 1826 by Vincenz Priessnitz (1799-1851).

GRAFFITI (Ital., *graffito*, a scratching), or WALL SCRIBBLINGS, the name given to certain classes of mural inscriptions and drawings found at Pompeii, Rome, and other ancient cities in Italy. They are generally scratched with a sharp instrument, or scrawled with red chalk or charcoal, on walls, door-posts, and portico-pillars, and seem to be the work of idle triflers; but some were executed with more serious intention. The subjects that oftenest occur are doggerel verses, quotations from the poets, amatory effusions, rude caricatures, especially of gladiators, etc. The more serious examples are electioneering admonitions, play-bills, and similar public announcements, philosophic apothegms, notices of household events, etc. These scribbles serve as an admirable index to the current life of the people, especially in Pompeii. Without them we should have a far less adequate idea of the street life of the ancient Roman people, and of the phraseology and idiom of the vernacular spoken toward the end of the first century A. D. in Southern Italy. Three alphabets were used—Latin, Greek, and Oscan. In Rome *graffiti* have been found on some of the great buildings, as the palace of the Cæsars and Nero's golden house.

GRAFTING: in horticulture, the uniting of a shoot or scion, containing one or more buds, to a stock or root, with a view, by their union, to produce a superior fruit. There are a number of ways of grafting: for an account of some of which the reader is referred to the article on *HORTICULTURE*, in *Britannica*, Vol. XII, pp. 236-37. On farms cleft-grafting is the form generally adopted, and the only tools required are a sharp saw, a keen pocket-knife, a butcher-knife and a mallet, for splitting the stocks, and grafting wax for spreading over the mutilated parts. The stock is sawed off square, split, and two scions inserted, one on each side, tapered down to a wedge shape, and so placed that the inner bark of the stock and the scion will just meet. Old orchards may be renewed and the fruit improved by grafting the limbs with desirable varieties, the thorough pruning involved infusing new life; and new varieties can sooner be brought into bearing when thus top-grafted than if planted as nursery trees. Fine results have been attained by grafting a third of the limbs of a tree at once, and the remaining two-thirds at intervals of a year. Twenty-eight and one-half bushels of choice apples are reported to have been gathered, in Con-

necticut, in the sixth year from the first grafting, from a single tree that was seventy-five years old, and had previously borne inferior fruit.

Another common mode of grafting is by inarching. A modification of this may be practiced where the bark of a valuable tree has been injured. The injury is pared smooth at the edges of the bark down to the live wood, and a piece of healthy bark fitted accurately thereto, and covered with grafting wax until it is healed, or scions set close together, and brought fresh bark to fresh bark, at top and bottom, and securely fastened.

In root-grafting experience proves that a perfect union of the root and scion may be effected at any point of the root, and that cuts of roots of one or two years' growth, smooth and straight are best. These should be taken up from the seed-bed in the fall, selected, tied in bundles, and stored in a cellar or buried in the soil, where they will remain fresh. After the roots have been cut into pieces 2 to 4 inches in length, and the scions prepared, the work of grafting may be taken up at any time during the winter. In performing the work the grafter takes up a stock, cuts the slope near the collar, and also the tongue, if that style of grafting is to be done. The tongue and slope of the scion have been previously cut and the scions laid ready to hand. The grafter then picks up a scion and adapts it to the root-stock, the tongues of the two keeping them together. The process of grafting is completed by applying melted wax with a brush, and wrapping the grafts with waxed strips of muslin or paper, or tying them with waxed thread. By a division of labor immense numbers of grafts may be turned out. Machinery has also been applied to the business, and grafting apparatus facilitates the work. One machine consists of a frame or gauge which regulates the angle of the slope, which is cut with a broad chisel, while others consist of shears to cut the slope and tongue at one operation.

The grafting of grapevines has never been successful until quite recently. For this operation the earth is removed from the old vine as far as the root will permit, exposing the collar. The vine is cut off 3 or 4 inches below the surface of the earth. Cuts are then made in the stub about half an inch deep or a little more. These clefts are made with the "Wagner saw," which has two thin saw-blades $\frac{1}{2}$ inch apart, with a sharp chisel blade between them, and the scions of the grape to be propagated about 6 inches long, are inserted into these clefts in the stump, letting their lower ends extend into the soil below the incision. In order to effect this the cuts are made obliquely downward into the bark and wood of the root. The earth is firmly pressed about the cutting and the stock, and only one or two eyes of the scions left exposed. This method of grafting the grape-vine permits the use of strong-growing varieties as stocks for those that grow less vigorously. If, for instance, the Delaware vine, which is a slow grower, is grafted upon a Concord stock, which is a strong grower, a more vigorous Delaware vine is secured, inclined to produce larger berries and more of them, and less inclined to drop the leaves. Where phylloxera has devastated vineyards, it has been found necessary to graft the desired varieties upon the roots of varieties that are not affected by the destructive insect.

GRAFTING: in surgery, is the transplanting of a portion of flesh, bone or skin to supply a deficiency caused by disease or wounds. The material may be taken from another part of the same body, as in the case of skin-grafting is usual, or from another person or animal, which is the usual method in bone or flesh-grafting. This system has grown

in favor as the structure of the body has become better understood—the construction of the tissues, and the methods by which the process of repair can be assisted. Under the titles of ANATOMY, PATHOLOGY, and SURGERY, in *Britannica*, Vols. I, XVIII, XXII, the subjects are well considered.

At first applied in repairing injuries to the nose, ears, and lips to render deformity less conspicuous by Tagliacossi (see *Britannica*, Vol. XXIII, p. 20), skin-grafting is now used also in cases where large surfaces of the skin are abraded, or where burns or scalds have taken off the cuticle. This is called Reverdin's operation. Small pieces of skin are planted over the exposed surface, which become fixed and extend toward each other and toward the extensions put out by the sides of the wound. Although the result is not true skin, it is a healthy tissue, and prevents, where it is successful, the sloughing of a wound and dangerous complications. A case reported as having recently occurred in New York has caused much comment. A prominent member of a club was unfortunate enough to lose a large patch of the skin of his face, whereupon a number of his club associates volunteered to have small patches of their respective skin, generally from the left arm, removed for his benefit. All these small patches were transplanted to the bared surface of the patient, and made up a complete covering of the denuded part. The operation was reported to have been successful.

BONE-GRAFTING has also been tried with varying success. In a case lately reported in New York, where the shinbone of a boy had been injured, the defective part of the bone was carefully removed, but leaving a portion of the osseine intact, and a similar portion of a bone of a dog's fore-leg was fitted into the vacated space without detaching it from the live dog. The boy and dog were kept immovably connected for some time, in order to induce the two joined bones to grow together. But the operation appears to have been only a partial success.

Prof. A. F. McGill, of Leeds, England, reported in 1889 the successful treatment of a case of "non-united bone fracture," by the use of a bone-graft taken from a rabbit. The patient, a young man of twenty, had been suffering for a year from a fractured forearm. The fracture was compound, the wound being on the radial side. Through the wound the broken ends protruded. The ulna united perfectly, but the fragments of the radius would not join. Three months after the accident a surgeon exposed the ends of the bone, refreshed them, and wired them together. The wound healed, but the fragments did not unite.

Several months later the patient applied to Dr. McGill for relief. The bones were bared for the space of three inches, and the ends found rounded, with no signs of union, but covered with a thick membrane resembling periosteum. This was filed away and the bone tissue again bared, and an interval of three-fourths inch left between the punctured ends. Then small fragments of the femur of a freshly-killed rabbit (six months old) were taken, having been chiseled out of the femur—13 pieces of one or two lines in length; and with these the interval between the ends of the bones was filled, and the inserted pieces were held together by the replaced skin, which was carefully stitched, and the whole held in place by numerous catgut sutures. No drainage tube was used. In about a month the patient left the hospital fully cured, and with the arm as useful as ever.

GRAFTON, the county-seat of Walsh county in the northeastern part of N. Dak., about 110 miles north of Fargo. Pop. (1890), 1,594.

GRAFTON, the county-seat of Taylor county, W. Va., on Valley River. The chief industries are lumber and coal. The village has railroad shops, foundries, and flouring mills. Pop., 3,159.

GRAHAM, SIR GERALD, LIEUTENANT-GENERAL, a distinguished British soldier, who received in 1855 the coveted order of the Victoria Cross for personal bravery at the assault of the Redan, was born in Cumberland in 1831. He entered the Military Academy at Woolwich in 1847 and received his commission as second-lieutenant in the Royal Engineers in 1850. He served through the Crimean campaign and fought at Alma and Inkerman and was twice wounded. He received numerous medals, and for conspicuous gallantry was made a Knight of the Legion of Honor. He took part in the China war of 1860 and was severely wounded at the assault of the Taku forts. He was present at the capture of Peking. In 1882 he commanded the 2nd brigade of the 1st division in the Egyptian campaign, receiving the thanks of both Houses of Parliament. He defeated a large force of Arabs at Tamai, with great slaughter. In 1885, after the fall of Khartoum, he commanded an expedition to Berber and laid the Suakin and Berber Railroad. On the 20th of March, 1885, he fought the battle of Hasheen. He was decorated with the Grand Cross of SS. Michael and George by Queen Victoria. He has contributed some valuable articles upon military matters to current literature and translated Von Goetze's *Account of the German Engineers' Operations During the Campaign 1870-71*. His *Last Words with General Gordon*, contributed to the *Fortnightly*, was a paper of much public interest.

GRAHAM, SYLVESTER, vegetarian, born in Suffield, Conn., in 1794, died in Northampton, Mass., Sept. 11, 1851. In 1823 he entered Amherst College, intending to prepare for the ministry, but did not complete the course. He began to preach in 1826, and in 1830 engaged in the temperance work. Becoming convinced that intemperance could be cured by the adoption of a purely vegetable diet, he afterwards applied the theory to other forms of disease. He published *Essay on Cholera* in 1832, and in 1839 delivered a course of lectures entitled *Graham Lectures on the Science of Human Life*. He also published *Bread and Bread-making; A Lecture to Young Men*, and one volume of *The Philosophy of Sacred History*.

GRAHAM, WILLIAM ALEXANDER, an American statesman, born in Lincoln county, N. C., in 1804, died at Saratoga, N. Y., Aug. 11, 1875. He became a lawyer, and in 1833 was elected to the Legislature of North Carolina. Several times he was chosen speaker of the Assembly of that State, and in 1841 he was elected United States Senator. From 1845 to 1849 he was governor of North Carolina. When Fillmore became President, he appointed Graham Secretary of the Navy. In June, 1852, the Whig party nominated him for Vice-President, but he was defeated. After this he remained in private life until 1864, when he became a Senator in the Confederate Congress.

GRAHAME, JAMES, historian, born in Glasgow, Scotland, Dec. 21, 1790, died in London, England, July 3, 1842. He graduated at St. John's College, Cambridge, and in 1812 was admitted to the Scottish bar. He subsequently removed to the south of England. In 1827 he published the first two volumes of a history of the United States, and in 1836 a new edition in four volumes was published, bringing the history down to the year 1776. The work was highly praised by the historian Prescott and others, but was not popular in England, because of its thoroughly American spirit. A Philadelphia edition was published in 1845.

GRAND BANK, a fishing village and port of entry on the south side of Fortune Bay, N. F. It has considerable trade.

GRAND BANK, a submarine plateau in the Northern Atlantic, extending about 350 miles eastward from Newfoundland. Its formation is attributed to the deposit of stone and earth from icebergs melted by the warm waters of the Gulf Stream. The Grand Bank is the headquarters of the cod-fishery.

GRAND BAY, or **HA-HA BAY**, an inlet from the Saguenay River in Chicoutimi county, Quebec, Can. It is a beautiful sheet of water, averaging a mile in width and about 100 fathoms in depth, and is a source of attraction to summer tourists.

GRANDEES (Span., *Grandes*), since the 13th century the most highly privileged class of nobility in Castile, the members of the royal family being included. Their honors were hereditary; they held lands from the crown on the tenure of military service, were exempted from taxation, could not be summoned before any civil or criminal judge without a special warrant from the king, and could leave the kingdom, and even enter the service of a foreign prince at war with Castile, without incurring the penalties of treason. They had also the right of being covered in the presence of the king. In the national assemblies they sat immediately behind the prelates and before the titled nobility (*titulados*). Under Joseph Bonaparte their privileges were entirely abolished, but they were partially regranted at the subsequent restoration. Grandees are still members of the Senate in their own right.

GRAND FORKS, the county-seat of Grand Forks county, N. Dak., on the Red River of the North. It contains the University of North Dakota. P., 7,500.

GRAND HAVEN, capital of Ottawa county, Michigan, on Lake Michigan, and on the south bank of Grand River, 31 miles west by north of Grand Rapids by rail. It has a good harbor, with two lighthouses, and ships large quantities of lumber and grain. It contains several lumber mills and manufactories of wooden-ware, etc.; and a magnetic spring renders the place a summer resort. Pop., 5,914.

GRAND ISLAND, a city, railroad junction, and county-seat of Hall county, Neb. Shipping grain is the chief industry. Pop. (1890), 7,536.

GRAND JUNCTION, the capital of Mesa county, Colo., on the Denver and Rio Grande Railroad, at the confluence of Grand and Gunnison Rivers.

GRAND JUNCTION, a town of Greene county, Iowa, on the Chicago and Northwestern Railroad, where it crosses the Des Moines and Fort Dodge Railroad, 38 miles south of Fort Dodge. The principal business in the vicinity is farming and stock-raising. Pop. (1890), 932.

GRAND LEDGE, a village of Eaton county, Mich., 12 miles west of Lansing. It has a mineral spring, is a health resort, and has good water-power. Pop. (1890), 1,606.

GRAND MANAN, an island in the Bay of Fundy, 22 miles long and from 3 to 6 wide, belonging to New Brunswick. It is fertile and has many good harbors. The chief settlement is Grand Harbor. The cod, herring, and haddock fisheries are important. The island is a summer resort.

GRAND MONADNOCK, or **MONADNOCK**, a solitary mountain peak of Cheshire county, N. H., supposed to be a detached member of the White Mountain group. It is 3,718 feet high.

GRAND PRÉ (postoffice Lower Horton), a village lying in the basin of Minas, Kings county, N. S., 15 miles from Windsor. It is the scene of Longfellow's *Evangeline*. The village contains a seminary.

GRAND RAPIDS, a city and county-seat of Kent county, Mich., at the head of steamboat navigation on Grand River, and at the junction of six railroads. It is 60 miles west-northwest of Lansing. The sawing and planing of pine and hardwood lumber, and the manufacture of furniture, cooperage, and wooden-ware, are the leading industries. Farm implements, iron goods, wire, leather, flour, machinery, beer, chemicals, white bricks, cement, stucco-plaster, and land-plaster are also extensively manufactured. See *Britannica*, Vol. XI, p. 47. Population in 1860, 8,025; 1870, 16,507; 1880, 32,016; 1890, 64,147.

GRAND RAPIDS, a city and county-seat of Wood county, Wis., on Wisconsin River. Lumbering and agriculture are the chief occupations. There are lumber mills, machine shop, and foundry in the city, and pure kaolin is found in the vicinity. Pop. (1890), 1,702.

GRANGER, GIBSON, born in Suffield, Conn., July 19, 1767, died in Canandaigua, N. Y., Dec. 31, 1822. He graduated at Yale in 1787, was admitted to the bar, and soon became prominent in his profession. He was a member of the Legislature of Connecticut, and was instrumental in the establishment of the school fund; became Postmaster-General of the United States in 1801; and in 1819 was elected to the State Senate.

GRANGER, GORDON, born in New York in 1821, died in Santa Fé, New Mexico, Jan. 10, 1876. He graduated at the United States Military Academy in 1845, engaged in the Mexican war, and at the commencement of the civil war was assigned to duty on the staff of Gen. Sturgis. In September he was appointed colonel 2d Michigan cavalry, in 1862 commanded the cavalry on the operations that led to the fall of Corinth, and commanded various districts in Kentucky and Tennessee. He was in command of the 4th army corps at the battle of Missionary Ridge; of a division at Fort Gaines, Ala., in 1864; and commanded the 13th army corps in the southwest, engaging in the siege of Fort Morgan, and throughout the operations that resulted in the fall of Mobile. He was brevetted first-lieutenant and captain for services in the Mexican war, and for gallant conduct in the civil war, the brevets from major to that of major-general were conferred upon him. In January, 1866, he was mustered out of the volunteer service; in the following July was promoted to colonel, and at the time of his death was in command of the district of New Mexico.

GRANGERS, an American national association of agriculturists, founded by a government clerk named Kelly in 1867, under the title of "patrons of husbandry." The objects of this secret society, with its ritual and its four orders for men and women, are the social improvement and industrial benefit of the farming class: music and literary exercises at the meetings and the establishment of libraries have proved useful for the former, and organization and the spread of newspapers published in the interest of farmers have advanced the latter object. The discussion of political questions at the meetings is forbidden. In 1871 there were only some 200 granges organized; in 1875 there were 30,000; and, although dissensions for a time greatly reduced the strength of the order, in 1885 at the annual session of the national grange 34 state granges and 24,000 subordinate granges were represented.

GRANT: in English law, the conveyance of property by deed. Movables are granted when they are comprised in a bill of sale or deed of gift. The real property act of 1845 enacted that the immediate freehold might be conveyed by deed of grant. In the United States generally livery of seizin is

dispensed with, and the term "grant" applies to all transfers of real property.

GRANT, SIR ALEXANDER (1826-84), a Scotch educator. He was educated at Harrow and Balliol College, Oxford, and was elected to an Oriel fellowship. He succeeded as baronet in 1856, was appointed inspector of schools at Madras, India, in 1858, and became professor of history in Elphinstone College there; then its principal, and afterwards vice-chancellor of Elgin College, Bombay.

GRANT, ULYSSES S. General of the United States Army, and eighteenth President of the United States, was born at Mt. Pleasant, O., April 27, 1822, and died on Mt. McGregor, near Saratoga N. Y., July 23, 1885. He was the son of Jesse R. and Hannah S. Grant, of Scottish ancestry. General Grant was the oldest of six children. His father was a tanner, as well as farmer, but Ulysses spent his early youth in aiding in the farm work. In the spring of 1839 he was appointed to a cadetship in the United States military academy at West Point, N. Y. As a student he was specially characterized by proficiency in mathematics and in cavalry drill, but gained a fair standing in all his studies. In horsemanship he held the highest standing in his class. At his graduation in 1843 his general average was marked 21 in a class of 39. Receiving his commission as brevet Second Lieutenant he was attached to the 4th Infantry, and was assigned to duty at Jefferson Barracks near St. Louis. Early in 1844 he accompanied his regiment to Camp Salubrity, La. In September, 1845, he was commissioned Second Lieutenant, and was transferred with his regiment to Corpus Christi, Texas, to aid the army of occupation under General Zachary Taylor. He participated in the battles of Palo Alto, May 8, 1846, Resaca de la Palma, May 9, 1846, (and in the latter commanded his company,) and Monterey, Sept. 23, 1846. In the last battle, when the troops had gained an advanced position, a volunteer was called for to make his way to the rear under heavy fire and order up the ammunition wagons. Lieutenant Grant instantly volunteered and successfully accomplished the perilous work. He took part under General Scott in the siege and capture of Vera Cruz in March, 1847, and later in the battle of Cerro Gordo, San Antonio, Churubusco, Molino del Rey, and Mexico. In all of them his conduct was characterized by the highest and most intelligent bravery. On the withdrawal of the troops from Mexico he was granted leave of absence, and visited St. Louis where, on Aug. 22, 1848, he married Miss Julia B. Dent, sister of one of his classmates.

Soon after, he returned to his regiment, and in the spring of 1851 was transferred to Sackett's Harbor, N. Y., and later to Detroit, Mich.; and again to Sackett's Harbor; and from the latter place he sailed July 5, 1852, with his regiment, via Panama, for California, and thence to Fort Vancouver, Oregon. On Aug. 5, 1853, he was promoted to a Captaincy in the Regular Army. On July 31, 1854, he resigned his commission and settled on a small farm near St. Louis. He remained on the farm and in real estate, until April, 1860, when he removed to Galena, Ill., and there became a clerk in the hardware and leather store of his father.

The attack on Fort Sumter in Charleston and the opening of the great civil war, in 1861, restored to the army General Grant, who instantly and warmly espoused the Union cause, and presided at the first Union meeting held in Galena. On June 17, 1861, he was appointed Colonel of the 21st Regiment of Illinois Volunteers and was soon in the field and a little later in charge of a sub-military

district in Missouri under Gen. Pope, his command consisting of three regiments of infantry and a section of artillery. He was appointed a brigadier general Aug. 7, 1861, his commission dating from May 17. He was ordered to Ironton, Mo., where he reported a day later. Ten days after he was ordered to St. Louis, and thence to Jefferson City, and eight days later was directed to report in person at St. Louis, where he found that he had been assigned the command of the military district of Southeastern Missouri, embracing all the territory of Missouri south of St. Louis and all Southern Illinois, with permanent headquarters at Cairo. Instantly he was at the work assigned him. He arrived at Cairo Sept. 4, and the next day hearing that the Confederates were about to seize Paducah, Ky., he moved the same night and early next morning was in possession of the place, and issued his famous proclamation to the citizens, in which he said: "I have nothing to do with opinions, and shall deal only with armed rebellion and its aiders and abettors." Gen. Grant's first engagement was on the morning of Nov. 7, when having learned that the enemy had established a camp at Belmont, opposite Columbus, he resolved to attack it and with a force of about 2,500 moved down the river and landing about three miles above the place, moved rapidly forward and led the attack in person. In the spirited engagement his horse was shot under him, but the enemy was routed and his camp captured, after which Grant returned to his boats with 175 prisoners, and two guns, and having spiked four other guns of the enemy. The whole force of the enemy was about 7,000, of whom 642 were lost. General Grant's loss was 485 men. The capture of Fort Henry came next, followed by that of Fort Donelson. In the latter Grant captured 65 guns, 17,600 small arms and 14,623 prisoners, with an additional loss to the enemy of 2,500 killed. Grant's loss was 2,041 killed, wounded and missing.

The remaining story of General Grant's life is that of the great civil war itself—the record of great battles, great achievements, and great successes over a gallant and powerful foe. A few additional dates only are needed in this outline sketch of the great General. The grade of Lieutenant-General was revived by act of Congress in February, 1864, and General Grant was nominated by President Lincoln for the post on March 1, and the nomination was confirmed by the Senate on March 2. He left March 4, in obedience to the order of the President for Washington, where he arrived on the 8th, and on March 9, received his commission as commander of all the Union armies. On April 9, 1865, the surrender to General Grant of General Lee, the commander in chief of the Confederate armies, with his whole forces composing the army of Virginia, took place at Appomattox Court House, and the war virtually ended.

Gen. Grant returned to Washington, April 10, to supervise the work of disbanding the armies. President Lincoln was assassinated on the evening of April 14, and it is believed that Gen. Grant would have shared the same fate had he not been out of the city on that date. On the accession of Vice President Johnson to the presidency immediately following the death of Mr. Lincoln, he (Johnson) indicated a purpose to have Lee and others punished for the crime of treason, under an indictment found by the United States Court in Virginia. Gen. Lee appealed to Gen. Grant asking to be permitted to enjoy the privileges of amnesty extended by presidential proclamation to others of the Confederate army. Grant endorsed the application as follows: "Respectfully forwarded, through the Secretary of War, to the President,

with the earnest recommendation that the application of Gen. Robert E. Lee for amnesty and pardon be granted him." But President Johnson emphatically denied the petition. Lee then appealed to Gen. Grant for protection and the latter endorsed the letter by a strong statement in which he said: "In my opinion the officers and men paroled at Appomattox Court House, and since upon the same terms given to Lee, cannot be tried for treason so long as they preserve the terms of their parole . . . and I would ask that he (Judge Underwood) be ordered to quash all indictments found against paroled prisoners of war, and to desist from further prosecution of them." The result was the abandonment of the prosecution. But the estrangement between the President and Gen. Grant continued. On July 25, 1866, in accordance with an act of Congress previously passed creating the rank of *General*, a rank higher than any previously existing in the United States, Lieutenant General Grant received the commission of GENERAL.

In the latter part of 1866 President Johnson, finding that General Grant would not support some of his measures, ordered him out of the country on a special mission to Mexico; but General Grant declined the mission on the ground that it was outside of the military service. Various other efforts were made to remove General Grant, but he was promptly sustained by Congress and by the great body of the people, and in 1868 he was nominated and elected President of the United States, carrying the electoral votes of 26 out of 34 states, and 214 electoral votes out of a total of 294. Four years later he was re-elected, carrying 31 states with a popular vote of 3,597,070, and an electoral vote of 286 out of a total of 352. During his two presidential administrations the taxes were reduced over \$300,000,000 and the public or national debt over \$450,000,000.

After retiring from the Presidency March 4, 1877, Gen. Grant decided to visit foreign countries and on May 17 of that year he sailed from Philadelphia for England accompanied by his wife and son. He was everywhere received with "royal greetings" by the sovereigns and peoples of the old world.

After leaving Great Britain he visited the continental countries of Europe and then journeyed through Egypt and Palestine; thence he sailed for India, visiting Calcutta and other places of interest. In the latter part of March, 1879, he sailed for Burmah and later visited the Malacca peninsula, Siam, Cochin China, and Hong Kong, reaching the last named place April 30th. Next he made a tour into the interior of China. At Peking Prince Kung requested him to act as arbitrator in settling a controversy between China and the Loo Choo Islands. In this matter, while prevented by his plans from acting in a formal arbitration, he studied the question in controversy, and gave such advice as to aid in a settlement without war. Next he visited Japan where the honors showed him were even greater than those received in any other country. He sailed from Yokohama Sept. 3, 1879, reaching San Francisco on Sept. 20 and received the heartiest of greetings everywhere on the Pacific coast, and on his journey eastward through the states to his former home in Galena. Early in 1880 he visited some of the southern states and Mexico.

The enthusiasm of General Grant's receptions in the old and new worlds, the favorable impression made upon the public by his brief, prudent, and practical speeches while abroad, together with the high estimate of his military genius and his civil administration as President of the United States, led many of his friends to seek for him the

nomination for a third presidential term. At the Republican nominating convention held in Chicago in June, 1880, the name of General Grant was presented and during the first thirty-six ballots secured votes ranging from 302 to 313. Owing, however, to the objection of many of the delegates to the nomination of General Grant for a third term, his adherents, to the number of 306, found themselves without the necessary support in the convention, and that body finally declared itself, upon a closing ballot, in favor of General Garfield.

In 1881 General Grant purchased a house in New York which he subsequently made his home, spending a part of his summers in a cottage presented to him at Long Branch near the city. The great interest taken by the public in a series of articles furnished by General Grant to *The Century* induced his friends to urge him to write his own biography to the close of the Civil War. He consented to do this, especially as the contract he was able to make with the publishers of his books promised him such large financial returns, as would relieve his family from much of the embarrassment caused by the losses of his property through the fraudulent conduct of some of his former partners in business. His contract for his biography, two volumes octavo, was signed Feb. 27, 1885, the work appearing about a year later; and so large was the patronage of an appreciating public, that the share of the profits insuring to Mrs. Grant and family from the first two years' sales, reached the large sum of nearly \$400,000!

In the summer of 1884 General Grant began to suffer from what soon proved to be a cancer at the root of the tongue. The sympathy of the whole nation was aroused in his behalf, and on March 4, 1885, Congress passed a bill making him General on the retired list, thus restoring him to the rank from which he resigned after the close of the war. In the meantime General Grant knowing that his disease was rapidly shortening his life, diligently worked on his biography, in the midst of almost continuous and intense suffering, heroically persisting in the task even after he became speechless, and until its completion, only four days before his death!

A few weeks before his death General Grant accepted the occupancy of an amply furnished cottage on Mount McGregor generously tendered to him by Mr. Joseph W. Drexel, of Philadelphia. There, in the quiet of that unpretentious, rural summer home, surrounded by his family, and enjoying the sympathy of the whole nation, and the respect and admiration of the nations of the world, he passed away, July 23, 1885. Since the burial of the Duke of Wellington, no great military hero had been interred with the honors which awaited the arrival of the illustrious soldier's remains in New York City. Magnificent as a mere pageant, it was equally so as the spontaneous outpouring of a great nation's grief and admiration.

Mrs. Julia Dent Grant, widow of the late Gen. U. S. Grant, was born in St. Louis, Mo., Jan. 26, 1826. She first met Lieut. Grant, then of the 4th Cavalry, at St. Louis in 1844, and was married to him on Aug. 22, 1848. She was often with him during his military career, and accompanied him on his victorious return to Washington at the close of the war. She presided over his home during his presidential official terms accompanied him in his journey around the world, and was

ever the faithful and beloved "queen" of his home circle. After his death she was granted a yearly pension of \$5,000. A similar pension has been granted to three other widows of Presidents—Mrs. Polk, Mrs. Tyler, and Mrs. Garfield. At this writing Mrs. Grant still resides in New York City, surrounded by her children (Frederick Dent, Ulysses S., and Jesse) and her grandchildren.

Frederick Dent Grant, oldest son of the late Gen. Grant, was born in St. Louis, May 30, 1850. He accompanied his father during the civil war, and was in five battles before he was thirteen years old. He graduated at West Point at the age of 21, and was assigned to the 4th Cavalry. In 1871 he accompanied Gen. Sherman to Europe. A year later he was detailed to command the military escort to the parties making the survey for the Southern Pacific Railway. In 1875 he was assigned, with the rank of lieutenant-colonel, to the staff of Gen. Sherman, holding the position for eight years, when he resigned. He was with his father during his trip round the world, and was his father's constant assistant during his closing years.

GRANVILLE, GRANVILLE GEORGE LEVESON-GOWER, EARL, an English statesman, born in London in 1815, died March 30, 1891. After being educated at Eton and Christ Church, Oxford, he entered public life in 1835 as an attaché to the embassy at Paris, where his father was the ambassador. In 1836 he was elected to Parliament. In 1846 he succeeded to the title. Granville was under-secretary for foreign affairs, 1840-41; vice-president of the board of trade, 1843-51; foreign secretary, 1851-52; lord-president of the council, 1852-54; again 1855-58; and 1859-66. He was colonial secretary, 1868-70, and secretary of state for foreign affairs, 1870-74, and again from 1880 to 1885. When Gladstone became prime minister, in 1868, Granville was made secretary for the colonies. He held several other offices and positions of honor—as, for instance, when he represented Great Britain at the coronation of Czar Alexander, at Moscow in 1856. As to his politics, Granville was one of the most outspoken Liberals in the House of Lords.

GRANVILLE, a village of Washington county, N. Y. Its industries are agriculture, quarrying, and the manufacture of roofing slate and mantels and other articles made of marbled slate.

GRANVILLE, a village of Licking county, Ohio. It is the seat of Denison College, two female colleges, and has several manufacturing establishments. Pop. (1890), 1,306.

GRAPE, the berry of climbing shrubs called vines, indigenous to warm latitudes, and much cultivated in all ages and in both hemispheres. See HORTICULTURE, *Britannica*, Vol. XII, pp. 277-28; VINE, Vol. XXIV, pp. 237-38; WINE, Vol. XXIV, pp. 601-11; and VITICULTURE, in these Revisions and Additions.

GRAPPLE-PLANT (*Uncaria procumbens*), a procumbent plant of the same genus with the Gambir, a native of South Africa. The seed vessel has many hooked thorns, and clings most tenaciously to any animal—a provision for the distribution of the seed. When it lays hold of the mouth of an ox, Livingstone says, the animal stands and roars with pain and a sense of helplessness.

GRAPTOLITES, a name given to a group of fossils, commonly supposed to be hydrozoans, and allied to the living sertularians. They usually appear as impressions on the shales of the Silurian rocks.

GRASS-CLOTH, a name sometimes given to different kinds of coarse cloth, whose fiber is rarely that of a grass. Cloth is made from bamboo, and a coarse matting is made from esparto, both true grasses. A fine cloth is woven from the fiber of a species of *Behmeria*, popularly called China-grass, but the plant is really a nettle. To the nettle order also belongs the so-called Queensland grass-cloth plant (*Pipturus argenteus*), which yields a fine strong fiber.

GRASSE, JOHANN GEORG THEODOR, an eminent German biographer, was born at Grimma, in Saxony,

* For a more extended biography, the reader is referred to the following: *Personal Memoirs of U. S. Grant*, Written by Himself, 2 vols., 1885-6; *Military History of Ulysses S. Grant*, by Adam Badeau, 3 vols., New York, 1867-81; *Life and Public Services of General U. S. Grant*, by James Grant Wilson, 1888; *The Ancestry of General Grant and their Contemporaries*, by Edward C. Marshall, 1869; and *Around the World With General Grant*, by John Russell Young, 1880.

in 1814, died at Dresden, September, 1885. He studied philology at Leipsic, was afterwards engaged in teaching at Dresden, but in 1843 was made librarian of King Friedrich-August II. In 1871 he became sole director of the "Geeen Vault," with its celebrated collection of jewels, gold, silver, and curios. From 1837 to 1860 he published a large work entitled *Lehrbuch einer allgemeinen Literaturgeschichte aller bekannten Völker der Welt*, wherein he collected and arranged a great mass of bibliographical material. His *Handbuch der allgemeinen Literaturgeschichte* is a compendium of the larger work. He also very diligently studied the myths and legends of the Middle Ages, and wrote several books on these subjects. Besides these works he published treatises on hunting, on beer, on porcelain, on ancient coins, on surnames and Christian names, on Latin names, etc., and published in 1876 a popular history of Saxony.

GRASSE, FRANÇOIS JOSEPH PAUL, COMTE DE, a French admiral, born at Valette, Provence, in 1723, died at Paris, Jan. 11, 1788. He was first in the navy of the Knights of Malta (1734), when he fought against the Turks. In 1749 he passed

into the service of France; but, while on a convoy to the East Indies, he was captured by a British admiral and imprisoned in England for two years. In 1762 he became a captain, and when France came to the assistance of America in 1778 he was made a rear-admiral. In March, 1781, De Grasse set out from Brest with a large fleet, conveying also a large land force to the United States. In June he assisted at the taking of Tobago, and then sailed to the mouth of the Chesapeake, in order to assist in the operations against Lord Cornwallis. The British admirals endeavored in vain to drive him from his position; and Cornwallis, shut up in Yorktown, was obliged to surrender to Washington, Oct. 19, 1781. De Grasse received the thanks of Congress for his share in this decisive victory. In January, 1782, he captured from the British the island of St. Christopher, in the West Indies. But on April 12 of the same year, after a gallant fight with Rodney near Jamaica, De Grasse was taken prisoner and conveyed to London. There he assisted in the negotiations relating to the peace of 1783, by which the Independence of the United States was acknowledged.

GRASSES AND OTHER FORAGE PLANTS. For an elaborate botanical description of GRASSES, see *Britannica*, Vol. XI. pp. 53-60. Grasses (*Gramineæ*) are widely distributed from equatorial to arctic regions, some genera being especially abundant in the tropics, but the majority belonging to the temperate zones. In the number of individuals they probably exceed all other flowering plants, while in the number of species the family stands third, the first and second places belonging to *Compositæ* and *Leguminosæ*. In usefulness to man they easily take the first rank, as they are the foundation of all agriculture, their herbage affording the larger share of the food of animals, while their seeds supply, in the cereal grains, the chief food of the world. Rice, durra, maize, wheat, rye, oats, barley, and sugar-cane need only to be mentioned to show the economical importance of the family. It is a singular fact that the most useful, those which furnish the cereal grains, are none of them known with certainty in the wild state, even their native countries being in doubt. But few grasses present marked properties. *Anthroxanthum*, *Hierochloa* and a few others have a pleasant vanilla-like odor, due to a principle like *coumarin*. Some Oriental species of *Andropogon* afford in their foliage the oils of lemon-grass, citronella and geranium, and from the roots of another species is obtained the perfume "vetiver." The rhizomes of *Triticum repens* and of *Cynodon dactylon* have long had a reputation for usefulness in diseases of the bladder. The many uses which the stems of species of *Bambusa*, the bamboos, are made to serve in China and other Eastern countries, give them a high rank among the useful grasses. In ornamental gardening, besides furnishing the carpet of verdure, without which our gardens would lose much of their attractiveness, grasses play an important part. From the humble *Festuca glauca*, the striking blue foliage of which is used for edgings, up to the stately *Gynerium argenteum*, the pampas-grass, the list of ornamental species and varieties is a long one (*BOTANY OF CALIFORNIA*, *Britannica*, Vol. II, p. 254).

The term grass is applied to all those plants which are used for pastures and meadows—a classification founded upon use alone, disregarding the

distinctive features of the plants. A true grass is an endogenous plant having simple leaves, a stem generally jointed and tubular, the husks or glumes in pairs, and the seed single. This definition includes, wheat, rye, oats, etc., and excludes clover and some other plants commonly called by the name of grass. In this article, however, the principal forage plants, other than true grasses, which are employed in agriculture, are treated of. With respect to grasses and forage plants adapted to different sections of the United States little is known. There are many climates, many kinds of soil, and many degrees of aridity and moisture; and consequently one species of grass cannot be equally adapted to all parts of this extensive territory; yet hardly a dozen species have been successfully introduced into agriculture. This number answers with a tolerable degree of satisfaction the wants of quite an extensive portion of the country, chiefly the northern and cooler regions; but in other localities the same kinds of grasses do not succeed equally well. This is particularly the case in the southern and southwestern States, the arid districts of the West and in California. The grasses which are in cultivation were once wild, and are still such in their native homes. Undoubtedly some kinds could be selected from the wild or native species which would be adapted to cultivation in those portions of the country which are not provided with suitable kinds. The solution of the question is largely a matter of experiment and observation.

The kinds of grasses now cultivated in this country are generally (1) red clover (*Trifolium pratense*); (2) white or Dutch clover (*T. repens*); (3) timothy (*Phleum pratense*); (4) blue grass (*Poa pratensis*); (5) wire grass (*Poa compressa*); (6) red top (*Agrostis vulgaris*); (7) orchard grass (*Dactylis glomerata*); (8) fowl meadow grass (*Poa serotina*); and (9) meadow fescue (*Festuca pratensis*). For feeding during droughts, Indian corn, sown at the rate of two bushels per acre, in drills two feet apart, cultivated thoroughly, once or twice, and cut when in blossom will make a good reliance, as also will German millet (*Panicum Germanicum*), and common millet (*P. miliaceum*). Above are designated nine species of forage plants that do well

generally. One, two, three, four, five and six constitute the bulk cultivated for pasture; and one and three for hay. Number seven is one of the most valuable in the whole list, and should be tried everywhere, on land not wet. Eight and nine are also well worthy of trial; fowl meadow grass especially has been found to take the place of blue grass in those sections of the Northwest where blue grass does not succeed. The hay is especially valuable for horses, it having all the advantages of wild hay, being free from the dust that infests timothy and clover, while it possesses all the nutriment of the best tame hay; and those dairymen who are acquainted with it pronounce it valuable hay for milch cows. Meadows of timothy alone are also very common, and when well managed are very satisfactory and profitable. It is also very common to combine red clover with timothy in various proportions. In low, wet meadows redtop is considerably employed, and it is a common constituent of pastures in all the Northern States. Some species of grass are adapted to clay lands, some to sandy soils, some to loam, some to dry upland, and some to low land; but for land of uniform quality it is believed that a mixture of five or six suitable varieties will yield a larger crop than one alone. The mixture of several varieties is perhaps most valuable in land that is designated for pasturage, as then they reach maturity at different times and furnish a succession of good feed, and also cover more completely and uniformly the ground. For a permanent pasturage under most circumstances the following kinds in proper proportions make a good mixture: June grass (blue grass), fox-tail (*Alopecurus pratensis*), redtop (bent grass), timothy, tall fescue, and perennial rye grass. For an immediate pasture the following mixture is generally satisfactory: Blue grass, 8 pounds; orchard grass, 4 pounds; timothy, 4 pounds; red clover, 6 pounds.

In all new countries the dependence must, of course, be first upon the wild grasses. As a rule these have not been sufficiently appreciated. Many of them are of exceeding value, but unfortunately are, as a rule, sparse seeders, and hence are apt to be neglected. The trouble is that farmers, as a class, do not investigate and experiment enough for themselves. Thus they are content with the most meager list of grasses, and, as a result, for a good part of the season their stock find insufficient food of proper succulence, and oftentimes are really distressed for subsistence.

There are many native and indigenous grasses in the West. There are sixty-five true grasses, excluding cereal grains and clovers, found on the Michigan Agricultural Farm, the most of them indigenous. In Illinois there have been found 105 native grasses (none peculiar to the State), eleven introduced, and twelve that are known as they are cultivated; a larger number, in proportion to the whole number of flowering plants in the State, than is usual in the same climate. This is owing to the extent and shape of Illinois, stretching from Lake Michigan to Kentucky. It has all soils, woods, prairie, and borders of lake and river.

On the native prairies may be found many species intermingled, each doing its part, some preferring low, wet situations, others growing only on wet ground; some prefer the shade of forest trees, while others flourish best on the most exposed parts of the broad prairies; some grow only in the water, others along the margins of lakes and streams; some attain their maturity early in the season, others late in autumn. Only through strenuous investigation and numerous trials will the farmer succeed in discovering the best species of grass for his farm and the support of his stock.

The clover family (order *Leguminosae*) embraces an immense number of plants of varying character, some small and insignificant, some trees of large size. Many of the most useful vegetable products are obtained from this order, which is characterized by having alternate, usually compound leaves, with stipules; flowers, polypetalous, the calyx mostly five-lobed, the corolla generally with five irregular petals, usually ten stamens, sometimes five, or many, usually united by the filaments, or nine united and one free, or sometimes all

distinct; the ovary, a one-celled carpel, becoming a legume or pod with few or many seeds, the pod sometimes marked into joints called *lomentis*. The genus *Trifolium* is one of the most useful of the order, and embraces a large number of species, several of which are well known in cultivation. The genus is characterized by having the leaves mostly trifoliate; that is, made up of three leaflets at the end of the leaf-stalk; some species have five or more leaflets, either close together at the end of the leaf-stalk or somewhat scattered in opposite pairs. The flowers are collected in roundish or oblong heads, with or without a general involucre. The calyx is five-toothed, the petals five, irregular, persistent; nine stamens united and one free; the pods small, mostly inclosed in the calyx, and one to four seeded. Among the specimens of this genus are: *Trifolium pratense* (red clover; common clover); *T. medium* (mammoth clover); *T. hybridum* (pl.; alsike clover); *T. incarnatum* (pl.; French clover); *T. repens* (white clover; Dutch clover); and *T. stoloniferum* (pl.-running Buffalo clover). Other genera are *Onobrychis* (pl.-), *Medicago* (pl.-), *Desmodium* and *Lespedeza* (pl.-). As regards the value of clover, we quote a paragraph from the report on the agricultural grasses and forage plants of the United States for 1889: "No matter how managed, clover is a benefit; and whatever else he may do, the farmer who grows clover is making a farm better. It does not need cultivating; the long deep-reaching roots mellow and pulverize the soil as nothing else can. If it grows thriftily the top acts as mulch, seeding the ground and keeping it moist. A crop of two tons or more of clover plowed under or cut for hay can hardly fail to leave the ground better than it was before. It should be the farmer's aim to grow the largest possible crop of clover."

CHEMICAL COMPOSITION OF AMERICAN GRASSES.—Of late years considerable attention has been given to the chemical composition of grasses, and much information has been gained concerning their nutritive value. The determinations of the grasses given in the above list of those commonly cultivated in the United States will be found in the table on the following page.

The specimens are from various parts of the country, and grown under several conditions of soil and environment. The development in nearly every case was full bloom or shortly after, that being the period at which the grasses as a whole seem to be cut for hay. The analyses have been calculated for "dry substance," and also for fresh grass, where the amount of water in the fresh grass had previously been determined; otherwise for the amount of water in hay. The great variation in composition of grasses becomes apparent on examining a table of one hundred and thirty-six analyses given in the special bulletin of the United States Department of Agriculture on the agricultural grasses and forage plants of the United States for 1889. The highest and lowest determinations, selected from this table, are shown in the following list of extremes:

Dry Substance.	High-est.	Low-est.
Ash.....	19.24	3.57
Fat.....	5.77	1.43
Nitrogen-free extract.....	66.01	34.01
Crude fiber.....	37.72	17.68
Albuminoids.....	23.13	2.89
Nitrogen.....	3.70	.45
Non-albuminoid nitrogen.....	1.64	.00
Per cent. of nitrogen as now albuminoid.....	60.70	.00
Water in fresh grass.....	76.50	60.00

The highest ash is undoubtedly owing to the presence of adherent soil, and the lowest carbohydrates are dependent relatively on the same cause. The wide variations in fiber and albuminoids must be regarded, however, as being entirely due to physiological causes which are difficult to explain. Species are not in themselves at all fixed in their composition, there being as large variations among specimens of the same as between specimens of different species. For illustration, several analyses of *Phleum pratense* in full bloom from widely separate localities are given in the following tables:

Soil and Stages of Growth.	When cut.	Height in centimeters.	Ash.	Fat.	Nitrogen-free extract.	Crude fiber.	Albuminoids.	Total nitrogen.	Non-albuminoid nitrogen.	Per cent. of nitrogen, non-albuminoid.	Water.	Ash.	Fat.	Nitrogen-free extract.	Crude fiber.	Albuminoids.

CULTIVATION OF GRASSES.—In regard to their cultivation and study by farmers, a practical authority on grasses says: Our meadows and pastures are capable of and require great improvement. We have on the one hand a market full of all kinds of grass seed and mixtures, none of which we are sure are good and many we know to be bad. On the other hand we have here and there in our fields already the grasses which are best suited to our soil and climate, but we have not even commonly accepted names for most of them, the few names we have being somewhat indefinite. Still fewer of them do we know by their looks and habits throughout the growing season. It follows that we have a great deal to learn of the varieties of grass.

All this should be changed. Our granges and farmers' clubs must be places for naming grasses and learning their uses. The experiment station can cooperate by receiving, cultivating and studying varieties that promise remarkably well, propagating from the root, and when the merit of a variety is established, raising seed from it and testing it on a large scale. Any farmer who will take the time can do this work as well as the station perhaps. Finally, we should leave our old pastures with a solid turf, that is, give the turf which has been establishing itself for years and has already got the enduring grasses in it, a chance by clearing it of bushes and weeds and saving it both from the plow and from neglect.

GRASS-MOTH (*Crabrus*), a genus of small moths, allied to the clothes-moth. The species, which are numerous, inhabit pastures. Their form, when their wings are closed, is long and narrow, pointed at the head, abruptly cut off at the opposite end. They are often brown and white, sometimes silvery and golden.

GRASS OF PARNASSUS (*Parnassia*), a genus of plants belonging to the natural order *Saxifragaceæ*. It is a native of bogs and moist heaths in Britain, Northern Europe and Russian Asia, becoming a mountain plant in Southern Europe and West-central Asia. The calyx is deeply five-cleft, the petals white, five in number, and there are five perfect and five imperfect stamens, the latter bear-

ing instead of anthers a tuft of ten to twelve globular-headed hairs. There are several other species, natives of Asia and North America.

GRASS-OIL, a name under which several volatile oils derived from widely different plants are grouped. The grass-oil obtained from the leaves of *Andropogon warancusa* is used for rheumatism. Ginger-grass oil is obtained from *A. nardus*, a native of India. Geranium oil, derived from *Pelargonium radula*, is used like ginger-grass oil. Turkish-grass oil is obtained from *A. pachnodes*, indigenous to India, Persia and Arabia. Lemon-grass oil, or citronella oil, is derived from *A. schænanthus*, indigenous to India and cultivated in Ceylon. It is largely used for scenting soap. Cyperus-grass oil is extracted from the tubers of *Cyperus esculentus*, indigenous to Southern Europe, and is used as a table oil and in the manufacture of soap.

GRASS-TREE (*Xanthorrhæa*), a genus of plants of the natural order *Liliaceæ*, natives of Australia. They have shrubby stems, with tufts of long, wiry foliage at the summit, a long cylindrical spike of densely aggregated flowers shooting up from the center of the tuft of leaves. The base of the inner leaves of some species is edible. All the species abound in a resinous juice, which, on exposure to the air, hardens into a reddish-yellow inodorous substance, soluble in alcohol, and useful as a tonic in dysentery, diarrhœa, etc. The common grass-tree (*X. hastilis*) has a stem about four feet high, but sometimes a foot in diameter. It is of extremely slow growth. Several species are found in Eastern Australia and also in New Zealand.

GRASSUM: in the law of Scotland, a sum paid on taking a lease of landed property. In England the words "premium" in some cases, and "fine" in others, mean the same thing.

GRASS VALLEY, a post-town of Nevada county, Cal. It contains two orphan asylums, several schools, foundries and quartz mills. This place is the center of the chief gold quartz-mining district of California. Pop. (1890), 4,032.

GRASSWRACK (*Zostera*), a genus of plants of the natural order *Naiadaceæ*, belonging to the

genera found at the bottom of the sea. The leaves are narrow and grass-like, and the flowers consist of stamens and pistils, without any perianth, inserted on the central nerve of one side of a flat, thin linear *spadix*, with a leafy *spathe*. The pollen is confervoid. The common grasswreck (*Z. marina*) is a perennial plant, which forms green meadows on the bottom of almost all European seas. It becomes white by exposure to air. The rush-like coverings of Italian liquor flasks are made of it, and it is used for packing glass bottles. The plant is now an article of commerce under the name of *Alga marina*.

GRATIAN, a Benedictine monk, who at Bologna, between 1139 and 1142, compiled the *Decretum Gratiani*.

GRATIOLA, a genus of plants of the natural order *Scrophulariaceæ*. *G. officinalis*, sometimes called hedge hyssop, is found in pastures in most parts of Europe. It is extremely bitter, acts violently as a purgative, diuretic and emetic, and in overdoses is an acrid poison. It was formerly so highly esteemed as a medicine that the name of *Gratia Dei* ("Grace of God") was given to it, and for the same reason it is known as *Herbe-au-Pauvre Homme* ("Poor Man's Herb"). *G. Peruviana*, a South American species, has somewhat similar properties. These properties are supposed to depend upon a resinous principle called *Gratiolin*.

GRATRY, AUGUSTE JOSEPH ALPHONSE, ABBÉ, a French theologian, born at Lille in 1805, died at Montreux, Switzerland, Feb. 6, 1872. After being educated at the École Polytechnique he became an ecclesiastic, and was in 1841 appointed director of the Collège Stanislas, Paris. In 1846 he was made chaplain of the normal school, Paris. In 1852 Gratry joined the Abbé Petetot in reorganizing the order of the Oratorians of the Immaculate Conception, having previously resigned his position in the normal school. In 1861 Bishop Dupanloup appointed him vicar-general of Orleans, and in 1863 he was made professor of Christian morals at the Sorbonne, Paris. Gratry had then already published a course of philosophy entitled *De la Connaissance de Dieu; De la Connaissance de l'Âme; Logique*, and several other philosophical works. He wrote and spoke against M. Renan in defense of the authenticity and truth of the Gospels, and his eloquence procured his election to the French Academy in 1867. Being censured by the superior of his order for his connection with Père Hyacinthe and the League of Peace, which advocates religious tolerance, Gratry retired from the Oratorians. *La Morale et la Loi de l'Histoire* is his latest work of importance. He declares therein that the French Revolution is a true regeneration of human society.

GRATTAN, THOMAS COLLEY, British author, born in Dublin, Ireland, in 1796, died in London, England, July 4, 1864. He studied law in Dublin, but afterward devoted himself chiefly to literature. In 1828 he went to Belgium and settled in Brussels, where he actively supported the pretensions of King Leopold to the throne of Belgium. He was British consul at Boston in 1839-53, and subsequently held an office in the Queen's household. He published a pamphlet on the boundary question between Great Britain and the United States, and an attack on American society and institutions, entitled *Civilized America* (2 vols., London, 1859). He also published *The Woman of Color*; and *England and the Disrupted States of America* (1861).

GRATUITOUS DEED: in the law of Scotland, a deed granted without any value received. Such

deeds, if made after the contracting of debt and in favor of a near relation or confidential friend, are presumed to be fraudulent and so null.

GRAY, ALBERT ZABRISKIE, born in New York city, March 2, 1840, graduated at the University of New York in 1860, and at the general theological seminary of the Protestant Episcopal church in 1864. He served as chaplain of the 4th Massachusetts cavalry during the civil war; subsequently held various pastorates, and in 1882 was elected warden of Racine College, Wisconsin. He was engaged in the work of church reform in Europe, and was a delegate to the general convention in 1886. Among his writings are *The Land and the Life* (1876); *Mexico As It Is* (1878); *Words of the Cross* (1880); and *Jesus Only, and Other Sacred Songs* (1882). He died Feb. 16, 1889.

GRAY, ASA, an American botanist, born in Paris, Oneida county, N. Y., Nov. 18, 1810, died in Cambridge, Mass., Jan. 30, 1888. He received his degree of M. D. in 1831, but soon devoted himself to the study of botany with the late Professor Torrey, of New York. In 1834 he received the appointment of botanist to the United States exploring expedition to the Southern seas, but declined the post. In 1842 he became Fisher professor of natural history at Harvard, from the active duties of which position he retired in 1873. In 1874 he succeeded Agassiz as a regent of the Smithsonian Institution. Dr. Gray was recognized throughout the scientific world as one of the leading botanists of the age, and was a member of the principal learned societies of both America and Europe. He was the first in America, in conjunction with Dr. John Torrey, to arrange the heterogeneous assemblage of species upon the natural basis of affinity; and he was an influential supporter of the Darwinian theories of evolution. Professor Gray published an admirable series of text-books, which are used extensively throughout the United States, and have passed through many editions. In 1838 he commenced, with Dr. Torrey, the unfinished *Flora of North America*.

GRAY, ELISHA, an American inventor, born at Barneville, Ohio, Aug. 2, 1835. He studied at Oberlin College, meanwhile supporting himself by working as a carpenter. His patents number about 50, a large number of which relate to the telephone, and the remainder to telegraphic apparatus. Among them are a speaking telephone and a multiplex telegraph. In 1893 he announced his invention of the teleautograph, by which autograph messages may be transmitted by electricity.

GRAY, HENRY PETERS, artist, was born in New York city in 1819, and died there in 1877. From 1869 to 1871 he was president of the National Academy, and he produced a large number of historical paintings and portraits.

GRAY, HORACE, born in Boston, Mass., in 1828; became a lawyer in 1851, and in succession reporter, associate, and chief justice of the Supreme Court of the State. In 1882 he was made associate justice of the United States Supreme Court, which position he now (1893) holds.

GRAY, ISAAC PUSEY, an ex-governor of Indiana, was born Oct. 18, 1828, in Chester county, Pa. He practiced law and served during the civil war. His political opinions have been varied, but in 1871 he attached himself to the Democratic party. He became a State senator in 1868, lieutenant-governor in 1876, and was elected governor in 1884. In March, 1893, he was sent as minister to Mexico.

GRAY, ROBERT, discoverer, born at Tiverton, R. I., in 1755, died in Charleston, S. C., in 1806. In September, 1787, he sailed from Boston in command of the sloop *Washington*, for the purpose of trading

with the natives of the northwest coast, and returned in 1790 by way of Canton, China; thus being the first man to carry the American flag around the globe. He made a second voyage, and on May 11, 1791, discovered the mouth of the great river which is now called Columbia.

GRAYDON, ALEXANDER, born in Bristol, Pa., April 10, 1752, died in Philadelphia, May 2, 1818. He was educated in Philadelphia, and studied law, but in 1775 received the appointment of captain and engaged in raising recruits for the army. He was in the battle of Long Island, and was taken prisoner in a subsequent action. He was exchanged in 1778, but did not rejoin the army. He was prothonotary of Dauphin county, Pa., 1785-99, resided for some years near Harrisburg, and removed to Philadelphia in 1816. He was a contributor to literary and political journals, and published *Memoirs of a Life, Chiefly Passed in Pennsylvania, Within the Last Sixty Years* (Harrisburg, 1811, reprinted in London and Edinburgh).

GRAYLING. See *Britannica*, Vol. XI, p. 78.

GRAYLING, the capital of Crawford county, Mich., situated on the Au Sable River and on the Mackinaw division of the Michigan Central Railroad. It has several lumber mills.

GRAY'S INN, one of the four inns of court in London.

GRAY'S PEAK, Rocky Mountains, in Summit and Clear Creek counties, Colo., 12 miles west of Georgetown. It is the twin of Torrey's Peak and of the same height, 14,466 feet. It was named in honor of Dr. Asa Gray.

GRAYVILLE, a town of White county, Ill., situated on the Wabash River at the mouth of the Bonpas River, and on the Cairo and Vincennes Railroad. The surrounding country is fertile, and considerable grain is shipped. Population, 2,000.

GRAYWACKE: in geology, a sort of conglomerate rock, found chiefly in the Palaeozoic series. The term has been little used since the establishment of the Silurian system.

GREASE, a term of general application to all fatty matters, but generally to those having some degree of solidity. It is mostly applied to fatty substances so deteriorated by dirt or other impurities as to be unfit for candle-making and other manufactures requiring some degree of purity in the material. Grease is largely employed as a lubricant for heavy machinery. The grease employed for the axles of wagons and carts consists of inferior kinds of grease mixed with a little tar.

GREASE-WOOD, a name applied to various chenopodiaceous shrubs growing abundantly in saline localities in the Western United States.

GREAT BARRINGTON, a village of Berkshire county, Mass., beautifully situated and noted as a summer resort. It has manufactories of woollens, cotton goods, paper, and brick. Population, 4,612.

GREAT BASIN, a vast elevated plateau stretching 500 miles between the Sierra Nevada and Cascade Mountains on the west, and the Wahsatch Range of the Rocky Mountains on the east. It is crossed by about one hundred short mountain ranges, which traverse it mostly in a southerly direction. North of it the country is drained by the Columbia River into the Pacific Ocean, and east of it by the Colorado River into the Gulf of California. The Great Basin itself has no outlet whatever.

The whole country is a desert like the Sahara, but more mountainous, rocky and desolate. Months pass without any rain. In most parts the entire yearly rainfall amounts to scarcely 4 inches. On account of the exceeding dryness no part of this region can be cultivated without irrigation, except some small

strips of land along the Humboldt and Carson Rivers. Most of its valleys, which are as a rule wide and open, have no rivers, except the small, narrow rivulets that rush down from the melting snows of the neighboring mountains. These rivulets rapidly disappear on reaching the plains, either by evaporation from the soil or by finding their way into one of the many small lakes and sinks which dot the surface. The waters of these lakes are generally salt, bitter, and unfit to drink for man or beast.

The area of the Great Basin is as large as France, and nearly five times as large as the State of Pennsylvania. It reaches from the northern boundaries of the States of Nevada and California down to the northern end of the peninsula of Lower California, a distance of nearly 600 miles. Most of it belongs to the States of Nevada and California and the Territory of Utah. A portion of this basin, north of the Mud Lake, reaches up into the State of Oregon, as far as 44° N. lat. Almost the whole State of Nevada lies in the Great Basin.

The northern portion of the Great Basin is the more mountainous and elevated. Here the valleys are usually 5,000 feet above sea-level, while the mountains rise to 10,000 or 12,000 feet. They become gradually lower as we go south; larger patches of country become flat, until we find in the southern portion valleys that are even lower than the level of the sea. Such are the Death and Coahuila Valleys.

MOUNTAINS.—Most of the mountain ranges of the Great Basin are composed of huge blocks which have been lifted by subterranean forces, broken in various directions, and tilted up on one side or the other. They have one steep face, exposing the broken edges of the original rock strata, and one gently sloping side, the slope conformable to the dip of the strata. The *Wahsatch Range* in Utah, which forms the eastern boundary of the Great Basin, has a north and south direction, like most of the basin ranges. On its western side it presents a bold, abrupt escarpment facing Great Salt Lake, while on the more gently sloping eastern side it is covered by tertiary deposits. Its highest peaks are 12,000 feet high. South of the Wahsatch Mountains is a region of high plateaus—the highest in America. Their drainage is carried by the Sevier River into the Great Basin. To the west of the Sevier Valley lies a range of three high tables, the southernmost, the *Markagunt Plateau*, about 11,000 feet high. On the opposite side of the Sevier Valley are the *Sevier* and *Puavsaunt Plateaus*, the former a table 60 miles long. East of this is the long stretch of Grass Valley, the waters of which burst through a deep gorge in the *Sevier Plateau* and join the Sevier River. East of this are the *Wahsatch Plateau*, a southerly extension of the Wahsatch Mountains, the *Fish Lake Plateau*, the *Awapa* and *Aquarius Plateaus*. All of these are over 11,000 feet high, and the Aquarius Plateau is partly covered by a forest of pine and fir trees.

The main range of Central Nevada is the *East Humboldt Range*, a single bold ridge 80 miles long, terminating at the Humboldt River, with many rugged summits over 10,000 feet high. Mount Bonplant at the northern end rises even 11,320 feet above sea level. Its long slopes carry pine forests. Westward of the East Humboldt lie the *Augusta*, *Carson Sink* and *West Humboldt Ranges*, the latter culminating in Star Peak, 9,920 feet high, and the *Virginia Range*, which latter is the first of the north and south ranges lying east of the Sierra Nevada. The Virginia Range is 150 miles long.

Besides the mountain ranges named there are nearly one hundred smaller ranges in the Great

Basin. In Southern Nevada and Southeastern California there are the *Amargosa* and *Funeral Mountains*, east of Death Valley; the *Panamint Range* west of that valley, and the *Inyo Range* just east of the Sierra Nevada, which it almost rivals in grandeur and exceeds in dreariness. South of the Inyo and Panamint ranges are the *Opal*, *Payute* and *Dead Mountains*, which are scarcely 5,000 to 6,000 feet high, and south of these the *Chocolate*, *Chuwavalla* and *Riverside Mountains*, which hardly average 4,000 feet.

VALLEYS.—The valleys between the ranges are more barren and desolate than the mountains. They are generally destitute of trees, because they are mostly destitute of water in summer. In some places we find sage-brush, more seldom bunch-grass, covering large level patches of ground. Here and there we find a snow-white alkaline flat without any vegetation whatever. The soil in these valleys is formed by alluvial deposits, and can very often be identified as the beds of ancient lakes of large extent. Some parts of these mud plains become so baked by the solar heat in summer that horses' hoofs leave no tracks, and so cracked in all directions as to look like mosaic-work. The alkaline dust, caught up by the wind, sometimes forms hollow columns two to three thousand feet high, and is at all times most vexatious to the eyes of travelers.

The *Carson* and *Black Rock Deserts* of Northern Nevada and the desert west of great Salt Lake exhibit the extreme of desolation and dreariness, but they are surpassed in area by the *Mohave Desert* in Southern California. *Amargosa Desert*, or *Death Valley*, lies in the southeastern part of Inyo county, Cal., and is 60 miles long and from 10 to 15 miles wide. Its lowest point is known as Benneetts Wells. It is 300 feet below the level of the sea, while the highest point of the Telescope range, just west of the valley, rises 11,000 feet above sea level. Furnace Wash, a small stream, enters Death Valley near its northern end. As it descends it forms a great swamp that spreads over a large portion of the valley, and gives off a fearful odor of sulphureted hydrogen. One sinks down to one's knees in walking over this swamp. Right above it is a salt crust a foot thick, surmounted by rough pinacles of saline efflorescence.

As we move away from this marsh and up the mountain side we meet a growth of salt grass so strongly saline that the horses will not eat it. Then comes the mosquito brush, consisting of big bushes covered with long poisonous thorns. A sage brush is next in order, and finally on the mountain tops grows a sort of stunted pine.

The animal life of Death Valley is very small. Besides the coyote we find rattlesnakes, lizards, scorpions and tarantulas. No birds are to be seen, except once in a while a few crows looking for perishing travelers. Rains are almost unknown to this region. The air is so dry that men venturing into the valley without carrying a large supply of water in barrels will soon die of thirst. This happened to parties of immigrants and explorers, and has given the valley its name. In 1850 thirty pioneers left Salt Lake City for California. They attempted to pass this valley at the north end. Soon their water gave out. They abandoned their teams and wandered for days without finding a stream of drinkable water. Then, parched with thirst, physically exhausted and mentally deranged, they lay down beneath the blazing sun and died.

The thermometer rises in summer often to 130° F. in the shade, so that this region is the hottest spot on earth, as it is the most desolate and for-

bidding. Wet clothes wrung out of water and hung up to dry in summer will have every stitch dried in 25 minutes. This excessive dryness makes it impossible for any vegetation to exist in Death Valley.

LAKES AND RIVERS.—Numerous small lakes in the mountains are fed by springs and melting snow. Their water is pure and fresh. The finest of these is *Lake Tahoe*, a beautiful sheet of water, which lies amid the peaks of the Sierra Nevada over 6,240 feet high. Its outlet, the Truckee River, flows northward into the *Pyramid Lake*, which is less than 4,000 feet high. *Lake Tahoe* is one of the deepest lakes in this country (1,645 feet), and abounds in fish. It is 21 miles long by 12 miles wide.

On the eastern side of the Great Basin lie *Utah Lake*, which discharges its waters through the Jordan into great Salt Lake, Utah, and *Bear Lake*, whose surplus waters are conveyed by Bear River into the same reservoir. *Great Salt Lake* is exceedingly saline and bitter. It is nearly 90 miles long by 32 miles wide at its greatest width, covering a surface of 2,360 square miles. Its greatest depth is 50 feet, but the greater part is scarcely 10 feet deep. The Bear, Ogden, Weber and Jordan Rivers feed this lake; but it has no outlet whatever. Its water contains about 15 per cent. of mineral matter, and is therefore so dense that the human body floats on it like a cork. Common salt forms nearly four-fifths of the solid contents; the remaining fifth is made up by chloride of magnesium as the principal ingredient, and the sulphates of sodium and potassium, with a trace of sulphate of lime. The lake is slowly rising since 1861.

Lake Mono is in California, a little south of Virginia City. It is 14 miles by 10, and has no outlet. Its water is strongly charged with sodium carbonate, and contains smaller quantities of lime carbonate, common salt and borax. Masses of tufa surround *Lake Mono*. They have been deposited from the lime carbonate formerly held in solution by the water. Near the center of the lake is a group of volcanic islands. Prof. Le Conte, upon his visit to this lake in 1872, found ample proof that it had risen 10 or 12 feet in about as many years.

Pyramid and *Willamucca Lakes*, although they have no outlets, are only slightly saline. Both of them are rising, the latter as much as 22 feet in as many years. *Owen's Lake* is between the Sierra Nevada Mountains and the Inyo range. Its saltiness is about twice that of sea-water. Sodium carbonate and common salt, in equal parts, are the chief saline ingredients, but potassium and sodium sulphates are also present. The *Humboldt* and *Carson Rivers* feed the *Humboldt* and *Carson sinks* or lakes, which have no outlets. They are the remains of the former *Lake Lahontan*. *Silver Lake*, north of *Lake Lahontan*, is the only fresh-water lake in the central part of the Great Basin. It is small, only 10 feet deep, and has no outlet. The numerous other lakes are alkaline and brackish; only a few of them contain water fit for stock to drink.

Summer and *Albert Lakes* are strong solutions of potash and soda salts, the potassium salts of the latter lake amounting to 70 per cent. of the total mineral contents. Millions of brine-shrimps live in these two lakes. *Alvord*, *Guano*, *Massacre*, *Warner* and *Christmas Lakes*, as well as those of *Surprise* and *Long Valleys*, are very shallow, and most of them evaporate to dryness in summer. *Goose Lake*, the deepest, does not exceed 20 feet.

Quaternary Lakes.—During the Glacial period, which covered the Eastern and Northern States

with ice, the greater part of the Great Basin was occupied by a number of lakes. Twenty-four of these lakes have been explored, the largest being Lakes Bonneville and Lahontan, both in the northern half of the basin, and that which occupied Death Valley, in the southern half of it.

Lake Bonneville was the largest of the quaternary lakes. It covered the regions now occupied by the Great Salt Lake and the broad desert west of it, including the Utah and Sevier Lakes. The highest water-line of Lake Bonneville is 1,000 feet above the present level of Great Salt Lake, and is conspicuously marked, but the most prominent water-line is 400 feet lower, and has been named the Provo shore-line. The outlet of this lake was found at the northern end of Cache Valley, through which the water escaped into the Snake River, and by the latter into the Columbia River and Pacific Ocean.

Lake Lahontan included the regions of Pyramid, Willamucca, Humboldt, Walker and the two Carson Lakes, all in Nevada, and Honey Lake in California; also the Truckee and Humboldt Valleys, and what is now called the Carson and Black Rock Deserts.

The shore-lines of this ancient lake are clearly defined throughout, and its coasts are scored by several horizontal terraces, each cut by the waves at a period when the lake maintained about the same height. A terrace 200 to 300 feet wide on the south side of the Carson Desert marks a level at which Lake Lahontan stood for a long period. A hundred feet above the present level of Pyramid Lake is a distinctly cut terrace. Tufa deposits rise from the alluvial beds of the lake bottom to various heights. Remains of fresh-water shells prove that the water of Lake Lahontan was fresh at its earlier periods. But salts, chiefly common salt,

but including borate, sulphate and carbonate of soda, and also borate of lime, are contained in the lake-beds in quantities sufficient to pay for their being worked for salt and borax. These deposits prove that the lake was strongly saline at its later period.

The most important rivers are the *Jordan*, in Utah, flowing northwards into Great Salt Lake; the *Sevier* and *Bear Rivers*, also in Utah; the *Humboldt River*, in Nevada, which flows 350 miles in a southwesterly direction, and disappears in the shallow and brackish waters of the Humboldt Lake and sink; the *Truckee River*, which connects Lake Tahoe and Pyramid Lake; the *Carson River*, flowing from the Sierra Nevada Mountains down into Carson Lake and sink; and *Walker River*, rising in the same mountain range and losing itself in Walker Lake. None of these rivers are navigable. But they are very valuable for the purpose of irrigating the very dry country.

Of animals we find only the mountain sheep native, and some fishes in the mountain lakes. Trout are found in the upper portions of the rivers. In the southern valley there are many snakes and lizards, but none of these are found in the northern parts.

The agriculture of the Great Basin is limited to those few areas that can be irrigated. The grazing of sheep and cattle on the bunch grass, which is found in some of the mountains, is of greater importance. The principal source of wealth is mining. The silver mines of Virginia City, Nevada, have produced large quantities of silver. There is also a growing industry in mining borax, salt, sulphur and carbonate of soda.

GREAT BEND, a city and county-seat of Barton county, Kan., on Arkansas River, near the center of the State. Pop. (1890), 2,450.

GREAT BRITAIN—BRITISH EMPIRE. For elaborate articles on the geography, history, government, literature, and earlier statistics of Great Britain and the British Empire, see in the *Britannica* the countries, severally, which together constitute the present British Empire.

The total area of the Empire in 1890 was estimated at 11,355,057 square miles, with an estimated population of 366,642,105. Capital, London, with a population of 5,633,332.*

SOVEREIGN AND ROYAL FAMILY.—Victoria, Queen of Great Britain and Ireland, and Empress of India, was born May 24, 1819; the daughter of Edward, Duke of Kent, fourth son of King George III. and of Princess Victoria of Saxe-Saalfeld-Coburg, widow of Prince Emich of Leiningen. She ascended the throne at the death of her uncle, King William IV, June 20, 1837; was crowned at Westminster Abbey, June 28, 1838; was married Feb. 10, 1840, to Prince Albert of Saxe-Coburg-Gotha; widow, Dec. 14, 1861.

CHILDREN OF THE QUEEN.—I. Princess Victoria (Empress Frederick), born Nov. 21, 1840; married, Jan. 25, 1858, to Prince Friederich Wilhelm (Friedrich I of Germany), eldest son of Wilhelm I, German Emperor and King of Prussia; widow, 1888.

II. Albert Edward, Prince of Wales, born Nov. 9, 1841; married, March 10, 1863, to Princess Alexandra, eldest daughter of King Christian IX of Denmark. Five children: Albert Victor, born Jan. 8, 1864; George, born June 3, 1865; Louise, born Feb. 20,

1867; married to the Duke of Fife, July, 1889; Alexandra, born July 6, 1868; Maud, born Nov. 26, 1869. Albert Victor, Duke of Clarence, died Jan. 14, 1892.

III. Prince Alfred, Duke of Edinburgh, born Aug. 6, 1844; married, Jan. 21, 1874, to Grand-duchess Marie of Russia, only daughter of Emperor Alexander II. Five children: Alfred, born Oct. 15, 1874; Marie, born Oct. 29, 1875; Victoria, born Nov. 25, 1876; Alexandra, born Sept. 1, 1878; Beatrice, born April 20, 1884.

IV. Princess Helena, born May 25, 1846; married, July 5, 1866, to Prince Christian of Schleswig-Holstein. Four children: Christian, born April 14, 1867; Albert John, born Feb. 26, 1869; Victoria, born May 3, 1870; Louise, born Aug. 12, 1872.

V. Princess Louise, born March 18, 1848; married, March 21, 1871, to John, Marquis of Lorne, eldest son of the Duke of Argyll.

VI. Prince Arthur, Duke of Connaught, born May 1, 1850; married, March 13, 1879, to Princess Louise of Prussia, born July 25, 1860. Three children: Margaret Victoria, born Jan. 15, 1882; Arthur, born Jan. 18, 1883; Victoria, born March 17, 1886.

VII. Princess Beatrice, born April 14, 1857; married, July 29, 1885, to Prince Henry, third son of Prince Alexander of Battenberg, uncle of Ludwig IV, Grand-duke of Hesse. Three children: Alexander Albert, born Nov. 23, 1886; Victoria Eugénie, born Oct. 24, 1887; Leopold Arthur Lewis, born May 21, 1889; Donald, born October 3, 1891.

COUSINS OF THE QUEEN.—I. Prince Ernest August, Duke of Cumberland, born Sept. 21, 1845, the grandson of Duke Ernest August of Cumberland, fifth son of King George III; married Dec. 21,

*See "Statesman's Year-book" for 1892, p. 20.

1878, to Princess Thyra, of Denmark, born Sept. 29, 1853. Six children.

II. Prince *George*, Duke of Cambridge, born March 26, 1819, the son of Duke Adolph of Cambridge, the sixth son of King George III; field-marshal commander-in-chief of the British army.

III. Princess *Augusta*, sister of the preceding, born July 19, 1822; married, June 28, 1843, to Grand-duke Friedrich Wilhelm of Mecklenburg-Strelitz.

IV. Princess *Mary*, sister of the preceding, born Nov. 27, 1833; married, June 12, 1866, to Prince Franz von Teck, born Aug. 27, 1837, son of Prince Alexander of Württemberg. Four children: 1. Victoria, born May 26, 1867; 2. Albert, born Aug. 13, 1868; 3. Franz-Josef, born Jan. 9, 1870; 4. Alexander, born April 14, 1874.

ROYAL SUPPORT.—The civil list of the Queen consists in a fixed Parliamentary grant, and amounts to much less than the incomes of previous sovereigns. Under George I this sum amounted at times to £1,000,000 sterling, but in 1777 the civil list of the King was fixed at £900,000, and the income over and above that sum from the hereditary possessions of the crown passed to the treasury. Under William IV the civil list was relieved of many burdens, and fixed at £510,000.

It is established by law (1 & 2 Vict., ch. 2), that during her Majesty's reign all the revenues of the crown shall be a part of the consolidated fund, but that a civil list shall be assigned to the Queen.

In virtue of this act, the Queen has granted to her an annual allowance of £385,000, of which the lords of the treasury are directed to pay yearly £60,000 into her Majesty's privy purse; to set aside £237,260 for the salaries of the royal household; £44,240 for retiring allowances and pensions to servants; and £13,200 for royal bounty, alms, and special services. This leaves an unappropriated surplus of £36,300, which may be applied in aid of the general expenditure of her Majesty's court. The Queen has also paid to her the revenues of the duchy of Lancaster, which in the year 1888 amounted to £86,285, and the payment made to her Majesty for the year was £50,000.

On the consolidated fund are charged likewise the following sums allowed to members of the royal family:—£25,000 a year to the Duke of Edinburgh; £25,000 to the Duke of Connaught; £8,000 to the Empress Victoria of Germany; £6,000 to Princess Christian of Schleswig-Holstein; £6,000 to Princess Louise, Marchioness of Lorne; £6,000 to Princess Henry (Beatrice), of Battenberg; £3,000 to the Grand-duchess of Mecklenburg-Strelitz; £5,000 to Princess of Teck, formerly Princess Mary of Cambridge; £12,000 to George, Duke of Cambridge; and £6,000 to Princess Helena of Waldeck, Duchess of Albany.

The Prince of Wales, the heir-apparent to the crown, has (by 26 Vict., ch. 1) settled upon him an annuity of £40,000, and by an act passed in 1889 receives £37,000 annually in addition for the support and maintenance of his children. The Prince of Wales has besides as income the revenues of the duchy of Cornwall, which in the year 1888 was £90,022, exclusive of £855 of arrears, the sum paid to the Prince being £61,971. In the year 1884 the income from the duchy of Cornwall was £103,133, exclusive of £10,133 for arrears; in 1889 the income from the duchy was £104,188, exclusive of £9,413. The Princess of Wales has settled upon her the annual sum of £10,000, to be increased to £30,000 in case of widowhood.

CONSTITUTION AND GOVERNMENT.—The Queen holds the crown both by inheritance and election. Her legal title rests on the statute of 12 & 13

Wm. III, ch. 3, of the English laws, in which it was declared that the succession to the crown of Great Britain and Ireland was settled on the Princess Sophia of Hanover, and the "heirs of her body being Protestants."

The supreme legislative power of the British Empire is granted by the Constitution to Parliament. The powers of Parliament are politically controlling not only within the United Kingdom, but also in the colonies and dependencies. The Parliamentary authority extends to all "ecclesiastical, temporal, civil and military" matters, as well as to altering the Constitution of the realm. Parliament is the highest court of law.

The present form of Parliament, which dates from the middle of the 14th century, is that of two houses of legislature, the House of Lords and the House of Commons.

For the order of rank or precedence in all the departments of government under the prevalent conventional rules in English society, see an exhaustive article on PRECEDENCE, *Britannica*, Vol. XIX, pp. 660-68.

THE HOUSE OF LORDS.—The House of Lords consists of peers who hold their seats—1. By virtue of hereditary right; 2. By creation of the sovereign; 3. By virtue of office—bishops of the English established church; 4. By election for life—Irish peers; and 5. By election for duration of Parliament—Scottish peers.

The number of peers named on the "roll" in 1893 was 551, 12 of whom were recorded as minors.

About two-thirds of these hereditary peerages were created in the present century. Excluding the royal and ecclesiastical peerages, the four oldest existing peerages in the House of Lords date from the latter part of the thirteenth century, while five go back to the fourteenth and ten to the fifteenth century. In 1888 two new peerages were created, one in 1889 and one in 1890. There are besides five peeresses of the United Kingdom in their own right, and three Scotch peeresses, and 18 Scotch and sixty-three Irish peers who are not peers of Parliament.

The crown is not restricted in its power of creating peers, and this power has been liberally used to fill up the House of Lords. In consequence of certain provisions of the Act of Union, limiting the right of election of the Scottish representative peers to the then existing peers of Scotland, it is understood that the sovereign cannot create a new Scottish peerage, and such peerages are in fact not created except in the younger branches of the royal family, though extinct or forfeited peerages may be restored. The sovereign is restricted to the creation of one new Irish peerage on the extinction of three of the existing peerages; but when the number of Irish peerages are reduced to 100, then, on the extinction of one peerage, another may be created.

SPEAKER OF THE HOUSE OF LORDS.—The lord high chancellor, who is appointed by mere delivery of the "great seal" to him by the sovereign, and who is the principal legal adviser of the crown, is by prescription speaker of the House of Lords, and may act in that capacity even though he be not a peer. He is by virtue of his office a privy councillor, and as the first existing great officer of state he takes precedence of all but royal dukes and the archbishop of Canterbury. He presides, if present, when the House of Lords is sitting as an appellate court. He is president of the chancery division of the high court and of the court of appeal, and is one of the judicial committee of the Privy Council. In the absence of the sovereign he reads the Queen's speech at the opening and pro-

gation of Parliament, and he is always one of the commission for giving the royal assent to bills. He is visitor of all hospitals of royal foundation, the general guardian of all infants, idiots and lunatics, and has the general supervision of all charitable trusts. His patronage is very extensive. He nominates the puisne judges and county court judges; and, except for Lancashire, he appoints the county magistrates, generally accepting the nominations of the lords-lieutenant and the borough justices. He is the patron of twelve canons and over six hundred livings. On retiring from office he receives a pension of £5,000 a year, but in such a case he commonly assists the lord chancellor and the lords of appeal in ordinary in the transaction of the judicial business of the House of Lords. While in office he receives a salary of £10,000—£4,000 as speaker of the House of Lords and £6,000 as judge. The attorney-general receives a salary of £7,000 and fees (in 1886-87 £5,109), and the solicitor-general a salary of £6,000 and fees (in 1886-87 £2,553).

THE HOUSE OF COMMONS.—The Lower House of Parliament consists of knights of the shire, or representatives of counties; of citizens, or representatives of cities; and of burgesses or representatives of boroughs, all of whom vote together. The Representation act of 1884 and the Redistribution of Seats act of 1885—the former extending to householders in *counties* the suffrages which previously had been conferred upon householders and lodgers in *boroughs*, while the latter made a new division of the United Kingdom into county and borough constituencies. Thus a uniform household and lodger franchise was conferred on counties and boroughs. The Representation act of 1884 also introduced a "service franchise," and placed the three kingdoms on a footing of equality as regards electoral qualifications. The new Reform bill has added nearly three million of electors to the roll, and there is now one elector to about every six of the population. The present total number of members is 670, against 652 who sat before the passing of the Redistribution act. The classified lists showing the relative representation of England, Scotland and Ireland in the Lower House of Parliament from the counties, boroughs, and Universities in 1891 are as follows:

Territorial.	Co.	Bor.	Univ.
England.....	253	237	5
Scotland.....	39	31	2
Ireland.....	85	16	2
Total.....	377	284	9

All elections for members of Parliament must be by secret vote and ballot—an act being passed annually to this effect.

The sole qualification required to be a member of Parliament is to be twenty-one years of age. All clergymen of the church of England, ministers of the church of Scotland, and Roman Catholic clergymen are disqualified from sitting as members; all government contractors, and all sheriffs and returning officers for the localities for which they act are disqualified both from voting and from sitting as members. No English or Scottish peer can be elected to the House of Commons, but non-representative Irish peers are eligible.

In order to preserve the independence of the members of the Lower House of Parliament, it was

long since enacted that if any member shall accept any office of profit from the crown, his election to Parliament shall be void, and a writ for a new election must issue; but he is eligible for reelection if the place be "not a new office created since 1705."

SPEAKER OF THE HOUSE OF COMMONS.—On the first day of the meeting of a new Parliament members of the House of Commons are summoned from their own chamber to the House of Peers, where her Majesty's pleasure is signified by the lords-commissioner that they shall proceed to the choice of some proper person to be their speaker. On their return the Commons proceed to the election accordingly, the clerk acting the while as chairman. On the following day the speaker-elect, with the House, is summoned to the House of Peers, and one of the lords-commissioner signifies her Majesty's approval of the choice made by the Commons. The speaker then, in the name and on behalf of the Commons, lays claim to their ancient and undoubted rights and privileges, which being confirmed he and his fellow-members return to their own chamber and the ceremony of taking the oath is proceeded with, he being the first to go through it. The speaker may hold office until a dissolution. Should the office become vacant during a session, the new speaker then elected is presented for the royal approbation, but does not claim the privileges of the House. This great officer has a residence in the palace of Westminster, and receives a salary of £5,000 per annum; he ranks as first commoner, and is usually awarded upon retirement a pension of £4,000 and a peerage. There has been no contested election for speaker since 1839.

THE CABINET MINISTRY.—The Executive Government of Great Britain and Ireland is vested nominally in the crown; but practically in a committee of ministers, commonly called the cabinet, whose existence is dependent on the possession of a majority in the House of Commons.

The member of the cabinet who fills the position of first lord of the treasury is, as a rule, the chief of the ministry; the term "premier" usually applied to him, is not official. It is at the premier's recommendation that his colleagues are appointed; and he dispenses the greater portion of the patronage of the crown. His salary is that of the chair or office which he holds as head of a department. The present premier, Rt. Hon. W. E. Gladstone, receives £5,000.

Mr. Gladstone's present (his 4th) cabinet is composed as follows: Prime Minister, William Ewart Gladstone; Lord High Chancellor, Lord Herschell; Lord President of Council, Earl of Kimberley; Chancellor of the Exchequer, Sir William Vernon Harcourt; Secretary of State, Home Department, Herbert Henry Asquith, Q. C.; Secretary of State, Foreign Department, Earl of Roseberry; Secretary of State, Colonial Department, Marquis of Ripon; Secretary of State, War Department, Henry Campbell-Bannerman; Secretary for Scotland, Sir George Otto Tevelyan; First Lord of the Admiralty, Earl Spencer; Chief Secretary for Ireland, John Morley; Postmaster General, Arnold Morley; President Board of Trade, Anthony John Mundella; President Local Government Board, Henry Hartley Fowler; Chancellor Duchy of Lancaster, James Bryce; First Commissioner of Works, George John Shaw-Lefevre; V. P. Committee of Council, Arthur Herbert Dyke-Acland.

Although the cabinet ministry is not the offspring of any formal election, it is virtually dependent upon the House of Commons, as an adverse majority in that body on any of its acts requires its immediate resignation.

The following is a complete list of the premiers, or heads of all the cabinet administrations of the British government from accession of the house of Hanover to 1893, with the dates of their appointments:

Prime Ministers.	Dates of Appointment.	
Robert Walpole.....	Oct. 10, 1714	
James Stanhope.....	April 10, 1717	
Earl of Sunderland.....	March 16, 1718	
Sir Robert Walpole.....	April 30, 1720	
Earl of Wilmington.....	Feb. 11, 1742	
Henry Pelham.....	June 26, 1743	
Duke of Newcastle.....	April 21, 1754	
Earl of Bute.....	May 29, 1762	
George Grenville.....	April 16, 1763	
Marquis of Rockingham.....	July 12, 1765	
Duke of Grafton.....	August 2, 1766	
Lord North.....	Jan. 28, 1770	
Marquis of Rockingham.....	March 30, 1782	
Earl of Shelburne.....	July 8, 1783	
Duke of Portland.....	April 5, 1783	
William Pitt.....	Dec. 27, 1783	
Henry Addington.....	March 7, 1801	
William Pitt.....	May 12, 1804	
Lord Grenville.....	Jan. 8, 1806	
Duke of Portland.....	March 13, 1807	
Spencer Perceval.....	June 23, 1810	
Earl of Liverpool.....	June 8, 1812	
George Canning.....	April 11, 1827	
Viscount Goodrich.....	August 10, 1827	
Duke of Wellington.....	Jan. 11, 1828	
Earl Grey.....	Nov. 12, 1830	
Viscount Melbourne.....	July 14, 1834	
Sir Robert Peel.....	Dec. 10, 1834	
Viscount Melbourne.....	April 15, 1835	
Sir Robert Peel.....	Sept. 1, 1841	
Lord John Russell.....	July 3, 1846	
Earl of Derby.....	Feb. 27, 1852	
Earl of Aberdeen.....	Dec. 28, 1852	
Viscount Palmerston.....	Feb. 8, 1855	
Earl of Derby.....	June 13, 1859	
Viscount Palmerston.....	Nov. 6, 1865	
Earl Russell.....	July 6, 1866	
Earl of Derby.....	Feb. 27, 1868	
Benjamin Disraeli.....	Dec. 9, 1868

It has become the most important function of the House of Commons in modern times to appoint the government for the time being, and, more immediately, those leading members of the government, headed by the prime minister, known as the cabinet.

SESSIONS OF PARLIAMENT.—Parliament is summoned by the writ of the sovereign issued by advice of the Privy Council, at least thirty-five days previous to its assembling. On a vacancy occurring in the House of Commons while Parliament is sitting, a writ for the election of a new member is issued upon motion in the House. If the vacancy occurs during the recess, the writ is issued at the instance of the speaker.

It has become customary, during recent years, for Parliament to meet in annual session extending from the middle of January to about the end of August. Every session must end with a prorogation, and by it all bills which have not been passed during the session fall to the ground. The royal proclamation which summons Parliament in order to proceed to business must be issued fourteen days before the time of meeting. A dissolution is the civil death of Parliament: it may occur by the will of the sovereign, or, as is most usual, during the recess, by proclamation, or finally by lapse of time, the statutory limit of the duration of the existence of any Parliament being seven years. Formerly, on the demise of the sovereign, Parliament stood dissolved by the fact thereof; but this was altered in the reign of William III. to the extent of postponing the dissolution till six months after the accession of

the new sovereign, while the Reform act of 1867 settled that the Parliament "in being at any future demise of the Crown shall not be determined by such demise."

Both Houses of legislature must be prorogued at the same time. The prorogation takes place either by the sovereign in person, or by commission from the Crown, or by proclamation. The Lower House appears at the bar, and if the sovereign be present, the speaker reports upon the labors of the session; the royal assent is then given to bills of the closing session, and a speech from the sovereign is read; whereupon the chancellor prorogues the Parliament to a certain day. Parliament resumes business, however, as soon as it is summoned by royal proclamation on a certain day, which may be at a date earlier than the original date of prorogation appointed. Should the term of prorogation elapse, and no proclamation be issued, Parliament cannot assemble of its own accord.

The following is a table of the duration of Parliaments of the United Kingdom during the present century:

Parliament.	When met.	When dissolved.	Existed.

AREA AND POPULATION OF THE BRITISH EMPIRE BY COUNTRIES.—The following figures are from the official census returns of 1891—the latest published at the date of sending these pages to press.

Name of Country.	Area in Sq. Miles.	Population.
Great Britain and Ireland.....	121,115	38,000,000
Indian Possessions, etc.....	1,648,944	286,000,000
Other Eastern Possessions.....	104,441	4,169,000
Australasia, etc.....	3,171,978	4,200,000
America (North).....	3,572,457	5,200,000
America (South).....	115,419	285,000
Africa.....	295,000	4,000,000
West Indies, etc.....	13,750	1,136,000
European Possessions.....	131	185,500
Totals.....	9,043,225	343,275,000

There is a considerable quantity of very recently acquired territory, the exact boundaries of which as yet remain undetermined and of whose population no accurate census has yet been taken. It is estimated that this will swell the total area of the Empire to 11,190,513 square miles and its population to 364,004,000.

The area and population of the divisions of the United Kingdom in 1891 were as follows:

Subdivisions.	Area in Sq. Miles.	Population.
England	50,823	27,482,104
Wales	7,363	1,518,914
Scotland	30,417	4,003,103
Ireland	32,583	4,706,162
Isle of Man	220	55,598
Channel Islands	75	32,272
Army, Navy, and Seamen abroad		
Totals	121,481	37,888,153

Of the total population, 19,319,157 were males, and 19,421,126 were females. In England and Wales the decennial increase was 11.65; in Scotland, 7.96; in Ireland, a decrease of 9.01; in the other Islands, a decrease of 4.07.

In England the density of population per square mile was 484; in Wales, 184; in Scotland, 122; in Ireland, 159.

In 1891 the emigration from the United Kingdom to British North America was 83,791; to the United States, 252,771; to Australasia, 19,714; total, 334,451.

EDUCATION AND RELIGION.—Elementary education is now compulsory in the United Kingdom, and in 1889 it was made free in Scotland. On April 1, 1891, there were in England and Wales 2,287 school boards embracing a population of 16,580,279. England and Wales reported in 1891 a total of 68 universities; Scotland, 6; Ireland, 4; total, 75; with 1,175 teachers, and 22,760 students. The total grants to primary schools in Great Britain (for examination and attendance of scholars) in 1891 was £5,351,000.

In England the Protestant Episcopal continues to be the established church, but all other churches are fully tolerated, and civil disabilities do not attach to any class of British subjects. There are 2 archbishops and 31 bishops. At the last census the population claiming membership in the State church was estimated at about 13,500,000, leaving about 12,500,000 to other creeds.

There are many Protestant dissenting religious bodies, the most numerous being Methodists of various branches, Independents or Congregationalists, Baptists and Presbyterians. The Methodists reported about 14,000 chapels with 760,000 members; the Independents, 360,000 members; the Baptists, 3,700 chapels, with 300,000 members. There are recorded in Great Britain 180 different religious denominations.

The number of Roman Catholics in England and Wales in 1887 was estimated at 1,354,000, with one archbishop and 14 bishops. In December, 1891, there were 1,362 Roman Catholic chapels and stations, with 2,573 officiating clergy.

The number of Jews in Great Britain and Ireland in 1888 was estimated at 70,000, of whom 40,000 resided in London.

The number of parishes of the established (Presbyterian) church in Scotland in 1890 was 1,332, with 1,663 chapels and stations and about 1,700 clergy. The number of Scotch Presbyterians not members of the established church is also large. The Free church in 1890 reported a total of 1,165,000. There are also Baptists, Independents, Methodists, and Unitarians. The Episcopal church in Scotland reported 7 bishops, 286 churches, 266 clergy, with an adhering population of about 80,000.

The Roman Catholic church in Ireland in 1890

was under the supervision of 4 archbishops and 23 bishops. In 1891 the census showed a total Roman Catholic population of 3,549,856.

The Church of Ireland (Protestant Episcopal) had, in 1891, 1,500 churches, with 620,000 members.

There were also in Ireland at the census of 1891, 446,687 Presbyterians, 55,235 Methodists, 17,017 Independents, 5,111 Baptists, 3,032 Quakers or Friends, and 1,798 Jews.

REVENUES AND EXPENDITURES.—The Budget for the year ending March 31, 1891, reported the estimated government income at £90,406,000 and the expenditure at £86,627,000. The sources of income and the branches of expenditure are shown in the following recapitulatory lists:

SOURCES OF INCOME, 1891.

Customs	£20,695,499
Excise	25,282,635
Stamps	15,475,824
Property taxes	16,279,125
Postal	10,747,594
Telegraphs	3,642,329
Crown lands	507,311
Suez Canal shares	279,155
Miscellaneous	3,416,663
Total income	£95,326,135

BRANCHES OF EXPENDITURES, 1891.

National debt charges	£25,000,000
Interest on railway bonds, etc.	214,000
Naval defense fund	1,430,000
Other consolidated fund charges ..	1,664,000
The army	17,728,000
The navy	13,787,000
Civil services	15,661,000
Collections and inland revenue	2,668,000
Postoffice service	5,548,000
Telegraph service	2,244,000
Packet service	653,000
Total expenditure	£86,627,000

Of the amount received from customs in 1891, the sum of £9,536,234 was for duties on tobacco; £3,418,562 for duties on tea; and £5,016,432 for duties on liquors. Of the receipts from excise the sum of £29,845,872 was for spirits, beer, and license duties, making a total government income in 1891 from spirits, liquors, and license duties of £34,862,304 or nearly £175,000,000.

The item "property taxes" embraces the following: "Land tax," £1,025,764; "house duty tax," £1,526,763; and the "income and property tax," £13,143,932; a total of property taxes of £15,696,459. As English statisticians regard the first four items of income recorded above as "taxes," the total income from taxes in the United Kingdom in the year ending March 31, 1891, must be set down at £80,456,332 or about £400,000,000. This is nearly five-sixths of the total income of the United Kingdom.

The national expenditures fall substantially under three categories: (1) The consolidated fund charges (£28,703,000), mainly applied on the national debt; (2) the army and navy (£31,685,000) and (3) the civil service, including expense of collection of revenue (£27,345,000) for year ending March 31, 1891.

The income tax is regarded as the most important of the direct taxes. This tax since 1881 has been from 5d. to 8d. per pound. In 1881 the rate was 6d.; in 1882, 5d.; in 1883, 6½d.; in 1883, 5d.; in 1885, 6d.; in 1886 and 1887, 8d.; in 1888, 7d.; in 1889 and 1890, 6d. Since 1877 only incomes of and over £150 are charged, and with an abatement of £120 on those under £400.

THE NATIONAL DEBT.—The national debt was greatest at the peace of Paris, 1815. The increase

during the war with Napoleon had been £323,386,041. At the commencement of the Crimean war in 1854, it was £769,082,549; during that war, about three years, it grew to £808,108,722, an increase of £39,026,173. On March 31, 1891, the debt was £685,954,018. The net total of the national debt, after deducting assets and balances, was at that date £680,681,581, or about \$3,402,407,905.

THE BRITISH ARMY.—During the year ending March 31, 1892, the army of the United Kingdom consisted of 7,473 commissioned officers; 993 "warrant" officers; 15,886 sergeants; 3,684 drummers, trumpeters, etc.; and 125,680 rank and file; a total of 153,696 men of all ranks—an increase of 1,213 over the previous year.

The official returns for 1891 showed a register of 13,316 officers and men in the cavalry; 21,078 in the artillery; 7,044 engineers, 86,896 infantry and spe-

cial corps; and 11,604 in miscellaneous establishments.

The maintenance of a standing army in time of peace without the consent of Parliament is forbidden by the bill of rights of the United Kingdom. Parliament must act on this question every year. There are two royal military academies or colleges—at Woolwich and Sandhurst.

The above figures include only those of the standing army. In addition there were four classes of reserves or auxiliary forces, viz.: reserves, 72,710; militia, 141,438; yeomanry, 14,086; volunteers, 262,613. These, with the standing army at home, and a force of 72,496 in India, make a grand total of 717,089 officers and men.

The daily pay of the staff and officers and also of the regimental lists is shown by the subjoined table, as furnished in the official reports of 1891:

Lieutenant-General, £5 10s.; Major-General, £3; Brigadier-General, £2 10s.; Colonel on Staff, £2 and £2 10s.; Deputy-Adjutant and Quartermaster-General, £2; Assistant ditto, £1 5s.; Deputy Assistant ditto, 21s.; Brigade-Majors, Senior Aids-de-Camp, and Assistant Military Secretaries, 21s.; Aids-de-Camp, 15s. and 18s.; Staff-Captains, 15s.; Garrison and Camp Quartermasters, 9s. to 15s.

† Additional to regimental pay.

THE BRITISH NAVY.—The navy of the United Kingdom is a perpetual establishment, and the statutes under which it is governed have been fixed with precision. We have stated above that for the army, the first vote of Parliament sanctions the number of men to be maintained; the second, the

charge for their pay and maintenance. For the navy, no vote is taken for the number of men; the first vote is for the wages of the stated number of men and boys to be maintained; and, though the result may be the same, this distinction exists both in practice and principle.

The number of seamen and marines provided for the naval service in the estimates for 1890-91, and also for the previous year, was as follows:

Branches of service.	1890-91	1891-92
For the fleet (including Indian troop-ships):		
Officers and seamen	43,449	44,734
Boys (including 1,950 under training)	6,244	7,149
Marines afloat and on shore	13,882	13,879
For the coast guard	4,200	4,200
Officers for various services	1,025	1,038
Total, all ranks	68,800	71,000

Included in the number of 44,734 seamen of the fleet were 14 flag officers and 2,690 commissioned officers, on active service. Provision was also made for 21,445 men of the royal navy reserves, 3,010 seamen and marine pensioner reserves, and 2,000 naval artillery volunteers.

The following table is taken from the official returns:

The total cost of the addition is calculated at £22,669,000. Of the armored turretted battle ships, three, the *Inflexible*, the *Trafalgar* and the *Nile*, have each a tonnage of nearly 12,000, and an armor thickness of 20 to 24 inches. The *Inflexible* is 320 feet long and 75 feet beam, with a total weight of 3,275 tons.

Class of Ships.	No. ships afloat Jan. 1, 1889.		Proposed standard in 1894.

COMMERCE AND INTERNAL COMMUNICATION.—The United Kingdom is classed as a free-trading country, the only duties levied being chicory, cocoa, coffee, dried fruits, plate, spirits, tea, tobacco and wine, the bulk of all the levies being spirits, tobacco, tea and wine. In 1889 the total imports were valued at £427,837,595; the duties levied were on goods valued at £29,671,692, or about 7 per cent. of the total imports. The total imports in 1890 were estimated at £420,691,997.

In 1889 the railway mileage aggregated 20,073 miles; on Jan. 1, 1891, there were in England and

Wales 14,119 miles; in Scotland, 3,162 miles; and in Ireland, 2,792 miles.

In April, 1891, the telegraph mileage aggregated 31,824 miles in length, with 190,312 miles of wire, including 17,211 miles of private wire.

For the history of Great Britain see *Britannica*, where it is brought down to the year 1874. The following is a reliable epitome of subsequent events:

The new Parliament of 1874, showing a large majority in support of a conservative ministry, Mr. Gladstone at once resigned and Mr. Disraeli entered

office as prime minister. During the term of power of the Conservatives, the Eastern question was again brought forward. Under the pretext of rescuing the Christians of Bosnia and Herzegovina from Mussulman oppression, Russia, with the view of acquiring Constantinople, declared war upon Turkey. Disraeli, in 1878, sent the British fleet to the Dardanelles, seized Cyprus, and ordered a contingent of Indian troops to Malta. On March 3, 1878, by the treaty of San Stefano, peace was concluded between Russia and Turkey. In the following summer the treaty of Berlin was made. The "Jingo" foreign policy of Disraeli precipitated an unrighteous war on the Zulu king, Cetawayo, and led also to the inglorious attack upon the liberties of the Boers in the Transvaal. The same spirit found expression in dealing with Indian affairs. Early in his ministry Disraeli appealed to the Oriental imagination by proclaiming Queen Victoria Kaiser-i-Hind, or Empress of India. An expensive series of campaigns in Afghanistan resulted in the replacement of a puppet ruler upon the throne of that country. At home, trade became depressed, taxes increased and in 1880 Lord Beaconsfield, as he had now become, dissolved Parliament. Mr. Gladstone then commenced his famous Midlothian campaign, and after a series of speeches which have become historical for power and eloquence, was returned to the House of Commons, backed by a Liberal majority of 150. The first care of the great Liberal was to put an end to the South African difficulty. He then turned his attention to Ireland, but, apparently, he had not at that time (1881) risen to an appreciation of the real condition of the sister island. His well-meant Land Act, which secured fixity of tenure, fair rents and free sale, was offset by its accompanying legislation, the Coercion Bill, under which more than 700 persons were imprisoned without trial in the winter of 1881-82. On May 6, 1882, the cause of Irish liberty received an almost fatal blow, when Lord Frederick Cavendish, the newly appointed chief secretary, and his subordinate, Mr. Burke, were murdered in Phoenix Park.

In 1882, the troubles in EGYPT (q. v.) led to the bombardment of Alexandria and the war of the Soudan. In 1885, the Home Rulers elected 84 of the 103 Irish members of parliament. They united with the conservatives and defeated the liberal administration, but on Mr. Gladstone's return to power a few months later he immediately introduced his great measure of Home Rule, which led to the revolt of the Liberal Unionists and their coalition with the Tories. A composite ministry was then formed, with the Marquis of Salisbury at its head, but the coalition led to a decided revolt by the great English constituencies, and at the general election of 1892, the Liberals were again returned to power. On February 13, 1893, Mr. Gladstone introduced his new Home Rule measure in the House of Commons. He spoke vigorously and clearly upon it for over three hours, creating by the masterly treatment of his subject a profound impression throughout the entire civilized world.

GREECE, kingdom of the Hellenes. Area, 25,041 sq. miles. Population (in 1890), 2,187,208. Capital, Athens, with a population of 114,335. For the geography, history and productions of Greece, see *Britannica*, Vol. XI, pp. 80-153. The territory detached from Turkey, consisting of most of Thessaly and a strip of Epirus, was added to Greece by a treaty with Turkey, executed—under pressure of the Great Powers—June 14, 1881. The kingdom, excluding these, is divided into 17 nomarchies. In 1889 the area and population were as follows:

Nomarchies.	Area English square miles.	Pop'nation 1890.	Pop. per sq. mile 1890.
NORTHERN GREECE:—			
Attica and Boeotia.....	2,472	257,764	104

KING AND ROYAL FAMILY.—Georgios I, born Dec. 24, 1845, the second son (Wilhelm) of Prince Christian of Schleswig-Holstein-Sonderburg-Glücksburg, present king of Denmark; elected king of the Hellenes by the national assembly at Athens, March 13 (30), 1863; accepted the crown through his father, the king of Denmark, acting as his guardian, June 4, 1863; declared of age by decree of the national assembly, June 27, 1863; landed in Greece in Nov. 2, 1863; married Oct. 27, 1867, to Queen Olga, born Aug. 22 (Sept. 3), 1851, the eldest daughter of Grand-duke Constantine of Russia, brother of the late Emperor Alexander II.

CHILDREN OF THE KING.—I. Prince Konstantinos, heir-apparent, born Aug. 2, 1868; married Oct. 27, 1889, to Princess Sophia, Princess of Prussia. II. Prince Georgios, born June 24, 1869. III. Princess Alexandra, born Aug. 30, 1870. IV. Prince Nicolaos, born Jan. 21, 1872. V. Princess Maria, born March 3, 1876. VI. Prince Andreas, born Feb. 13, 1882. VII. Prince Christophoros, born Aug. 10, 1888.

By decision of the Greek national assembly of May 15, 1863, a civil list of 1,125,000 drachmai (about \$200,000), was settled on King Georgios I., to which the governments of Great Britain, France and Russia added 4,000l. (or \$120,000) each, making the total income of the sovereign of Greece about 52,000l. (\$260,000) per annum. An annuity of 200,000 drachmai (about \$40,000) has been allowed to the heir-apparent since he came of age, in August, 1886.

MOVEMENT OF POPULATION.—The chief occupations of the people are the following, in percentages of the population, in Greece and Ionian Islands (census 1879): Agriculture, 40 per cent.; shepherds, 9 per cent.; industries, 6.37; servants, 7.75; laborers, 8.11; commerce, 6.37; landed proprietors, 6.10; seafaring, 3.05; army and navy, 4.86; priests, 1.50. In the ceded provinces (1881): Agriculture, 41.95; laborers, 12.32; industries, 10.21; shepherds, 8.18; servants, 7.24; commerce, 6.47; priests, 1.61.

The nationality of Greece is Hellenic. Most of the Albanians who have, at various dates during the last 400 years, migrated into Greece, have become Hellenized. At present there are not more than 90,000 or 100,000 of distinct Albanian nationality in the whole of Greece. These are scattered

in small communities, chiefly over Attica; northwards, as far as Thebes; then across the Isthmus of Corinth, throughout the ancient Argolis, in the southern districts of Eubœa, and a few of the neighboring isles. On the other hand, there are large numbers of Greeks in the Ottoman empire, raising the whole Greek nationality to over 8,000,000, as follows: Greece, about 2,200,000; Asia Minor, 2,000,000; Crete, Cyprus and other Ottoman islands, 400,000; European Turkey, 3,500,000; total, 8,100,000.

About one-half of the total population of Greece is agricultural, living dispersed in villages. The principal towns are the following:

Athens (1889).....	114,355	Argos.....	9,861
Piræus.....	34,569	Pyrgos.....	8,788
Patras.....	38,000	Argostoli.....	7,871
Hermoupolis.....	27,000	Calamata.....	11,000
Corfu.....	27,000	Chalcis.....	6,877
Zante.....	16,280	Spetsai.....	6,495
Larissa.....	13,169	Hydra.....	6,446
Tripolis.....	12,517	Mesolounghi.....	6,324

PRESENT RELIGION AND EDUCATION.—The great majority of the inhabitants of the kingdom are adherents of the Greek Orthodox church. Before the census of 1889 there were 1,902,800 belonging to the Greek Orthodox church; 14,677 other Christians, mainly Roman Catholics; 5,792 Jews; and 24,165 Mohammedans. By the terms of the constitution of 1864, the Greek Orthodox church is declared the religion of the state, but complete toleration and liberty of worship are guaranteed to all other sects. Nominally, the Greek clergy owe allegiance to the patriarch of Constantinople, though he now exercises no governing authority. The Orthodox church has nine archbishops and eight bishops in Northern Greece; six archbishops and six bishops in the Peloponnesus; one archbishop and five bishops in the islands of the Greek Archipelago; and five archbishops and ten bishops in the Ionian Islands. There are 161 monasteries and nunneries, with 2,620 monks and 485 nuns.

All children between the ages of five and twelve years must attend school, but the law is not well enforced in country districts. According to the census of 1879, 86.06 per cent. of males and 23.08 females could read and write. The following are the educational statistics of Greece for 1884: Universities, 1; gymnasia, 33; Hellenic schools, 297; communal schools, 1,741; elementary, 540; private, 81; ecclesiastical, 5; polytechnic, 1; pupils, 144,098.

The budget under date of Jan. 1, 1891, being the latest official report, contained an appropriation of 3,000,000 drachmai by the government for higher and middle education.

REVENUE AND EXPENDITURE.—The budget for 1892 estimates the total revenue at 96,541,462 drachmai, and the expenditures at 100,411,479 drachmai. The total amount of Greek indebtedness in June, 1892, was 704,892,500 drachmai. Of this sum rather less than 9,000,000 drachmai are for small outstanding internal indebtedness. In all accounts since 1882, the drachma is reckoned as equal to one franc.

ARMY AND NAVY.—All able-bodied males 21 years old are liable to military service, the total period of service being 19 years, of which two years must be passed with the colors, 7 and 8 years in the reserve, and the remainder in the militia or landwehr.

The nominal strength of the army in 1891 was 1,987 officers; 5,873 non-commissioned officers; 20,364 rank and file; total, 28,224, a larger number than that of the army of the United States of America.

The navy at the opening of 1890 consisted of two small armor-clads (1,710 tons), carrying two 10-ton

Krupp guns in a battery on the upper deck and four 20-pounders, speed 12 knots; and a wood-built vessel, the *Basalissa Olga* (2,060 tons), carrying four 6-ton and two 5-ton guns, speed 10 knots. One steel armor-clad, the *Hydra*, was launched in 1889; it is 6,000 tons, and is now in commission; another similar vessel has been constructed in France. There are 28 small torpedo boats and launches, and two Nordenfeldt submarine torpedo boats. Of unprotected vessels, there are two corvettes (1,300 and 1,800 tons), two cruisers (1,000 tons each, launched 1884-'85); 12 gun-vessels (six built 1881-'84, the rest old); four gunboats (1880); three revenue vessels (1884), an old steel yacht, an iron transport, and 17 miscellaneous craft. The budget for 1889 fixes the strength of the navy at 2,945 officers and men, but the actual number for 1891 was 3,957. The navy is manned partly by conscription from the people of the sea-coast and partly by enlistment. In 1887 the period of service was made two years instead of one.

INTERNAL COMMUNICATION.—Recently the internal communication by roads has greatly improved; there are now (1893) about 2,000 miles of roads. In May, 1882, the construction of a canal across the Isthmus of Corinth, about four miles, was begun; it is estimated to cost a million sterling; and more than three-quarters of the work is now completed.

Railways were opened in 1893 for a length of 374 miles, while 420 miles were under construction, and 226 miles were projected.

The telegraphic lines, land and submarine, were of a total length of 4,658 English miles, at the end of 1892; length of wire, 5,082 miles. The number of officers was 178. They despatched 686,416 inland telegrams, and 276,045 international, in the year, 1888. Receipts (1888), 1,130,160 drachmai; expenses, 992,320 drachmai.

Of post offices there existed 248 at the end of 1889, and there passed through the post in that year 7,664,000 letters, besides 236,000 post-cards, 6,779,000 samples, journals and printed matter. The receipts were 2,603,614 drachmai; expense, 2,882,240 drachmai. The total number of letters, post-cards, samples, newspapers, etc., which passed through the post office in 1890 was 14,319,864, of which 8,961,319 were internal and 5,358,545 international.

GREELY, the county-seat of Weld county, Colorado. It is a considerable trade center, and is situated advantageously at the junction of the Platte and Cache la Poudre rivers about midway between Cheyenne and Denver. Its educational institutions are of a high order of merit and have gained for it some reputation. Pop., 2,395.

GREELY, ADOLPHUS WASHINGTON, Arctic explorer, born in Newburyport, Mass., March 27, 1844, and graduated at Brown High School in 1860. He served as a volunteer through the war of 1861-'65; shortly after its conclusion entered the Regular Army as lieutenant, and in 1868 was placed on the Signal Service. In 1881 he was selected to conduct the expedition sent into the Arctic regions for the purpose of carrying on observations in accordance with the international plan arranged at Hamburg in 1879. With a party of twenty-five he sailed from St. John's, Newfoundland, in the *Proteus*, July 7, 1881. He and the six survivors of his party were rescued June 22, 1884, when at the point of perishing from starvation. Two of the party, Lieutenant Lockwood and Sergeant Brainerd, traveled to within 396 miles of the geographical pole, the most northern point hitherto reached. In 1887 Greely was appointed chief of the Signal Service, with rank of brigadier-general. In 1886 he published *Three Years of Arctic Service*.

GREEN, ANNA KATHERINE, novelist, daughter of James Wilson Green, a lawyer, who has held public positions in New York and elsewhere, was born at Brooklyn, N. Y., and educated at Ripley College, Poughkeepsie, N. Y. She has published *The Sword of Damocles*, 1881; *The Defense of the Bride*, and other poems, 1882; *The Mill Mystery*, 1886; *Marked Personal*, 1893. She became Mrs. Charles Rohlfis in 1884.

GREEN, MARY ANNE EVERETT, *née* Wood, was born in 1818, at Sheffield, England. In 1841 she removed with her parents to London. She edited *Letters of Royal and Illustrious Ladies* (1846); *The Diary of John Rous* (Camden Soc. 1856); *Letters of Queen Henrietta Maria* (1857). By appointment of the Master of the Rolls she calendared the papers of the reigns of James I. and Charles II.

GREEN, HORACE, M. D., LL. D., born at Chittenden, Vt., Dec. 24, 1802, died in Sing Sing, N. Y., Nov. 29, 1866. He graduated at the University of Pennsylvania, and at Middlebury College; began practice in Rutland, and afterwards spent several years abroad, studying in the hospitals of Edinburgh, London and Paris. On his return he became professor in the Medical College of Castleton, Vt., and remained there until his removal to New York city in 1850. He was soon afterwards chosen professor of the theory and practice of medicine in the New York Medical College, which position he held until obliged by failing health to resign in 1860. Author of *A Treatise on Diseases of the Air-Passages* (1846); *Pathology and Treatment of Croup* (1849); *Report of A Hundred Cases of Pulmonary Diseases* (1858), and other works.

GREEN, JACOB, son of Ashbel, born in Philadelphia, July 26, 1790, died there Feb. 1, 1841. He graduated at the University of Pennsylvania in 1806; in 1818 became professor of chemistry, experimental philosophy, and natural history at Princeton, and in 1822 professor of chemistry at Jefferson Medical College, which position he held until his death. Author of *Chemical Diagrams*; *Chemical Philosophy* (1829); *Astronomical Recreations* (1829); *A Syllabus of a Course of Chemistry* (1835); *Trilobites* (2 vols., 1832); *The Botany of the United States* (1833); *Notes of a Traveler* (1831); and *Diseases of the Skin* (1841).

GREEN, JOHN RICHARD, an English historian, born at Oxford in 1837, died at Mentone, Italy, March 7, 1883. After being educated at Magdalen College School and Jesus College, he took orders in 1860, and became curate of St. Barnabas church, a poor parish in the east of London. In 1862 he had charge of Hoxton, and in 1865 was made vicar of St. Philip's, Stepney. Overwork during the cholera time in 1868 obliged him to retire, and Archbishop Tait made him librarian at Lambeth. His health remained delicate, and his winters were spent usually on the Continent. He had been a frequent contributor to the "Saturday Review" before, and now he began to work on his *Short History of the English People*, which book he had ready for publication in 1874. This work was received with great enthusiasm all over England. The University of Edinburgh conferred on the author the degree of LL. D. In 1877 Green gathered a number of his essays into a book under the title *Stray Studies*, and in 1882 published a masterly work on *The Making of England*, wherein he went deeply into the foundation of England's greatness. In continuation of this he was preparing another work, to be called *The Conquest of England*, when his labors were cut short by death. In all his writings Green showed a lively imaginative faculty. His characters live, move, and act on each other as in real life. Distant places and times are made to appear distinct and perfectly natural.

GREEN, SAMUEL ABBOTT, physician, born at Groton, Mass., March 16, 1830, graduated at Harvard College in 1851, and took his medical degree in 1854. After spending several years in Europe he returned and settled in Boston. At the commencement of the civil war he was commissioned assistant surgeon of the 1st Massachusetts regiment of volunteers; was surgeon of the 24th Massachusetts regiment 1861-64, and for his services in the field during the latter year was brevetted lieutenant-colonel of volunteers. He was city physician of Boston in 1871-80, and was elected mayor in 1882. Author of *A History of Medicine in Massachusetts*; *Groton During the Indian Wars* (1883); *Groton Historical Series* (20 numbers, 1883-87); and other works. He has also published a large number of papers on scientific and historical subjects.

GREEN, SETH, American pisciculturist, born in Rochester, N. Y., March 19, 1817, died there Aug. 20, 1888. He received a common-school education, and for some years was proprietor of a fish and game market near his home. Having a passion for hunting and fishing, and being a close observer, he became interested in the habits of fish, and from his personal observations conceived the idea of artificial propagation. From that time he turned his attention to methods of increasing and protecting the yield of fish as a business. In 1868 he was appointed one of the fish commissioners of New York, and was soon afterwards made superintendent of fisheries in that State. He was the inventor of important hatching appliances, and the great advancement made in pisciculture is largely due to his efforts.

GREEN, WILLIAM HENRY, D. D., LL. D., born at Groveville, Burlington county, N. J., Jan. 27, 1825, graduated at Lafayette College in 1840, and studied theology at Princeton. Ordained to the Presbyterian ministry in 1848, he became pastor of the Central Presbyterian church of Philadelphia in 1849, and since 1851 has held the professorship of Hebrew and Old Testament literature in Princeton Seminary. He was chairman of the Old Testament company of the American committee of revision. He declined the presidency of Princeton in 1868. Author of *Hebrew Grammar* (1861); *Hebrew Chrestomathy* (1863); *The Pentateuch Vindicated from the Aspersions of Colenso* (1863); *The Argument of the Book of Job Unfolded* (1874).

GREENBACK PARTY, a political party which for some years after the war advocated the issue of paper currency by the government, and that national banks should be abolished. It has nominated presidential candidates, on two or three occasions, without success.

GREEN BAY, a city and county-seat of Brown county, Wis., situated at the head of Green Bay, and on the right bank of Fox River, at its mouth, 65 miles north-northeast of Fond du Lac and 113 miles north of Milwaukee. It is on three railroads, and has a good harbor and great facilities for trade and navigation. Large quantities of lumber are procured in Brown county, and exported from Green Bay. This city has extensive iron-works, and also several saw mills and factories. Population in 1860, 2,275; 1870, 4,666; 1880, 7,464; 1890, 9,069.

GREEN BRIER MOUNTAINS, a ridge in West Virginia lying northwest of the main Alleghenies. They are about 2,000 feet in height.

GREENBRIER RIVER, a river of West Virginia. It rises in the Allegheny Mountains in the northeastern part of the State, and flows southwest, entering the Great Kanawha River in Summers county, near Hinton. It is about 175 miles in length.

GREENCASTLE, a city, railroad center, and county-seat of Putnam county, Ind. Block coal, timber, sandstone, limestone, and some iron ore are

found in the vicinity. There are excellent schools, and De Pauw University is located here. Among the manufactures are iron and nails.

GREENCASTLE, a post-borough of Franklin county, Pa., 63 miles south of Harrisburg. It has agricultural machine works, a woolen mill, and a high school. Pop. (1890), 1,525.

GREENE COVE SPRINGS, the county-seat of Clay county, Fla., on St. John River, 30 miles south of Jacksonville. It is thought to be the "Fountain of Youth" referred to in Spanish and Indian legends. It contains a large sulphur spring.

GREENE, a village of Butler county, Iowa, on the Burlington, Cedar Rapids and Northern Railroad, 35 miles northwest of Cedar Falls. It has a good graded school, and several churches and grain warehouses. Pop. (1890), 845.

GREEN EARTH, a mineral of a green color and earthy character, often found in the vesicular cavities of crystalline igneous rocks, sometimes also disseminated through highly decomposed basic eruptive rocks. It consists principally of silica, alumina, magnesia, and protoxide of iron. *Glauconite* is the name given to the green earth which is not infrequently met with in sedimentary rocks. In such rocks glauconite occurs in the form of grains, which in many cases are the casts of minute shells. There is also a green earth used as a pigment by painters in water-colors, who know it by the name of *Mountain Green*. For their use it is mostly brought from Monte Bolso, and from Cyprus.

GREENE, GEORGE WASHINGTON, author, was a grandson of Gen. Nathaniel Greene, and was born in Kent county, R. I., in 1811. He wrote lives of his grandfather and other biographical and historical works, and from 1837 to 1845 was United States consul at Rome. He died Feb. 2, 1883.

GREENE, SAMUEL STILLMAN, born in Massachusetts, May 3, 1810; was for many years connected with educational matters in that State and in Rhode Island. In 1855 he became professor of mathematics and civil engineering in Brown University, and in 1864 was made professor of astronomy there, retaining the last position until his death in 1884.

GREENE, SAMUEL D., born in Cumberland, Md., 1839; graduated at Annapolis, and in 1861 volunteered on the iron-clad *Monitor*. He had charge of the guns during her fight with the *Merrimack*, and commanded her after Lieutenant Worden had been disabled. In 1862, he served on blockade duty, and in 1872 became commander. He also held various appointments in the naval academy, and died Dec. 11, 1884.

GREENE, THEODORE P., born in Montreal, Canada, November 1, 1809; removed to Vermont, and entered the United States navy as midshipman in 1826. He became commander in 1855 and did considerable service with the gulf squadrons during the war. In 1867 he was made commodore and had charge of the Pensacola navy yard until 1871. In March, 1872, he became rear-admiral on the retired list and he died Aug. 30, 1887.

GREENEVILLE, the county-seat of Greene county, Tenn., 75 miles northeast of Knoxville. It was the home of President Andrew Johnson. Greenville and Tusculum College is near the village. P., 1,779.

GREENFIELD, the county seat of Hancock county, Ill., 21 miles east of Indianapolis. It contains an expensive school building, and manufactures of flour and furniture. Pop. (1890), 1,131.

GREENFIELD, the capital of Hancock county, Ind., situated on the Columbus, Chicago and Indiana Central Railroad, 21 miles east of Indianapolis. It has large flouring-mills, planing-mills, a furniture factory, and graded school. Pop. (1890), 3,100.

GREENFIELD, the capital of Adair county, Iowa, situated on a railroad about 20 miles from Creston. Pop. (1890), 1,048.

GREENFIELD, the county-seat of Franklin county, Mass., located in the valley of the Connecticut. It is an important market for cattle, sheep, and butter, and has manufactories of children's carriages, bolt-cutting machines, and planes. A soldiers' monument is here and also a young ladies' seminary. Pop. (1890), 5,252.

GREENFIELD, a railroad junction of Highland county, Ohio, situated in the southwestern part of the State, and on a branch of the Scioto River.

GREEN ISLAND, a railroad junction of Albany county, N. Y., is an island lying in the Hudson River between Troy and West Troy, with which places it is connected by bridges. Machinery, castings, iron, and many railroad cars are here manufactured. Pop. (1890), 4,463.

GREENLEAF, HALBERT S., of Rochester, N. Y., a manufacturer, born in Guilford, Vt., April 12, 1827. He received a common school and academic education, was a justice of the peace in 1856, and served as private and officer in the Union army during the civil war. In politics he is a Democrat, and was elected a representative from the thirtieth Congressional district of New York to the 48th Congress. In 1890 he was elected from the same district to the 52d Congress.

GREEN MOUNTAINS, a range of the Appalachian system of mountains, extending through Vermont from Canada to Massachusetts. The highest point, Mount Mansfield, has an altitude of 4,430 feet. Other summits are Killington Peak, 4,221 feet, and the Camel's Hump, 4,188 feet in height. The mountains are mostly covered with forests of pine, hemlock, fir, spruce, and other trees, and contain iron, marble, copper, and some gold. Parts of the southern extension of this range, known as Hoosac or as Taconic Mountains, traverse the western part of Massachusetts and enter Connecticut and New York.

GREENOUGH, RICHARD SALTONSTALL, brother of Horatio, born in Jamaica Plains, Mass., April 27, 1819, and educated at the Boston Latin School. He began his career as sculptor in Paris, returned to the United States and resided for several years in Newport, R. I., but since 1874 has spent most of his time in Europe. He has been particularly successful as a sculptor of portrait busts. Among his works are a bronze statue of Franklin, executed in 1853, and placed in the City-hall Square of Boston; a marble statue of Gov. Winthrop, finished in Florence, 1855-56; the *Boy and the Eagle*, owned by the Boston Athenaeum; a *Carthaginian Woman*; *Elaine*; *Circe*; and a bust of Shakespeare, from the Chandos portrait.

GREENPORT, a village of Suffolk county, N. Y., the eastern terminus of the Long Island Railroad, 95 miles from Brooklyn. It has ship-yards, and the people are chiefly employed in fishing and coasting. On account of its bathing and fishing facilities it is a favorite resort. Pop., 2,500.

GREEN RIVER, a river of Kentucky, which rises near the center of the State, pursues a tortuous northwesterly course, and enters the Ohio River about 6 miles above Evansville, Ind. It passes near the mouth of the Mammoth Cave, and traverses the western coal-field of Kentucky. Its length is estimated at 350 miles, and it is navigable at high water 200 miles by means of locks and dams.

GREEN RIVER, a branch of the Colorado. It rises in Western Wyoming and pursues a generally southward course into Utah, uniting with Grand River near lat. 38° 16' N., and long. 110° W. Its

entire length is estimated at 750 miles, but it is not of much importance for navigation. Winding through the Great American Desert, bordered by cliffs two or three hundred feet in height, the depth of its cañons gradually increases, and for scores of miles it runs more than 7,000 feet beneath the surface.

GREENS, the common name of all varieties of kale or cabbage (*Brassica oleracea*), which do not boil, and of which the leaves are used for the table as boiled vegetables. Young unboiled cabbages, and shoots from the stocks of cabbages, are often also called greens. The leaves of German greens are very much curled. This herb is either sown in spring and planted out soon after, or it is sown in autumn and planted out in the spring.

GREENSAND, a term applied to a variety of sandstone containing considerable glauconite, a silicate of iron and potash, which imparts to it a greenish color. The greensand of Europe is divided into the Upper Greensand, belonging to the Upper Cretaceous, and the Lower Greensand, belonging to the Lower Cretaceous period (see Britannica, Vol. X, pp. 357-59). It is an important formation in the United States, and is in some localities extensively mined for fertilizing purposes. It is often called *marl*.

GREENSBORO, the county-seat of Hale county, Ala., located near the cane-brake region, which before the civil war was noted for its productiveness. Southern University, under Southern M. E. church control, is located here. Pop. (1890), 1,759.

GREENSBORO, the capital of Greene county, Ga., situated on the Georgia Railroad, 87 miles from Augusta. It contains a court-house, several churches and two academies. Pop. (1890), 1,313.

GREENSBORO, a city and county-seat of Guilford county, N. C., located 82 miles northwest of Raleigh. It contains spoke and handle manufacturing, saw and planing mills, and agricultural machine works. Much fruit is raised in the vicinity, and considerable of it is dried and shipped further south. A Methodist female college is located here. Pop. (1890), 3,317.

GREENSBURG, a city and county-seat of Decatur county, Ind., situated 47 miles southeast of Indianapolis. There are quarries here where fine stone is obtained and shipped. Among the manufactures are flour, woolen goods, furniture and carriages. The city has a pork-packing establishment and a foundry. Pop. (1890), 3,596.

GREENSBURG, the county-seat of Westmoreland county, Pa., 31 miles east of Pittsburgh. Grain, wool, coke and farming products are shipped from this point. Pop. (1890), 4,202.

GREEN SNAKE, a name applied to two different kinds of harmless grass-snakes of the United States, *Cyclophis vernalis*, common in the Middle and Northern States, and *Cyclophis aestivus*, which inhabits the Middle and Southern States. They are slender in form, and of a bright-green color.

GREEN'S POND, a town situated on an island of the same name, north of the entrance to Bonavista Bay, Newfoundland. It is a port of entry, and has importance as a fishing and sealing station.

GREENUP, the capital of Greenup county Ky., situated on the Eastern Kentucky Railroad, and on the Ohio River, about 20 miles from Portsmouth, Ohio. There are several iron furnaces near the village, and coal is mined in the vicinity. Pop., 669.

GREENVILLE, a city and county-seat of Butler county, Ala., 45 miles south of Montgomery. It has two colleges, a shingle factory, a boot and shoe factory, and other mills. Cotton and timber furnish the chief industries. Pop. (1890), 2,806.

GREENVILLE, the capital of Muhlenburg county, Ky., situated on the Paducah and Elizabethtown Railroad, 92 miles from Paducah. It has a female college, and several tobacco factories.

GREENVILLE, a city and county-seat of Bond county, Ill., 50 miles northeast of St. Louis, Mo. Almira Female College is located here. Pop., 1,868.

GREENVILLE, a city of Montcalm county, Mich., on Flat River, which has two dams at this point, and thus furnishes the abundant water-power utilized in the flour, saw, planing and shingle mills, and the machine shops and woolen mill. Pop., 3,066.

GREENVILLE, the capital of Washington county, Miss., situated on the Mississippi River, 100 miles from Jackson. It is the western terminus of the Greenville, Columbus and Birmingham Railroad. Considerable cotton is shipped here. Pop. 6,653.

GREENVILLE, a post-borough of Mercer county, Pa., on the Shenango River, at the head of the Shenango Valley. It has abundant water-power, a rolling-mill and coal works. Thiel College, under Evangelical Lutheran control, is located here.

GREENVILLE, the county-seat of Darke county, Ohio, on Greenville Creek. It has planing-mills and a furniture factory. In 1793 a fort was built here by Gen. Wayne, and two years later a treaty was here made with over 1,100 Indians. Pop., 5,473.

GREENVILLE, a city and county-seat of Greenville county, S. C. It is a pleasant summer resort, a railroad center and a great manufacturing city, carriages, wagons and cotton being among its productions. The United States court meets here semi-annually. The city is the seat of Furman University and Greenville Female College.

GREENWEED, a name given to certain half-shrubby species of *genista*. Hairy greenweed (*G. pilosa*) is sometimes grown in France on light soils as fodder for sheep.

GREENWICH, a village of Fairfield county, Conn., in the southwestern corner of the State and on Long Island Sound. The famous ride of Gen. Putnam in 1779 took place in this township.

GREENWICH, a village of Washington county, N. Y., situated on a railroad and on the Battenkill River, about 16 miles east of Saratoga Springs, and 30 miles northeast of Troy. It contains several factories. Pop. (1890), 1,663.

GREENWOOD, a village of Jackson county, Mo., on the Missouri Pacific Railroad. Lincoln College (United Presbyterian) is located here.

GREER, JAMES AUGUSTIN, born in Cincinnati, Ohio, 1833; entered the United States navy in 1848; commanded the *Benton* and a division at Vicksburg, and was with the Red River expedition. In 1873 he participated in the *Polaris* search expedition, having command of the *Tigress*. He became captain in 1876 and commodore ten years later.

GREGG, ALEXANDER P., born in South Carolina, October 8, 1819; entered the Protestant Episcopal ministry in 1846, and became rector in the same year. In 1859 he was elected bishop of Texas.

GREGG, ANDREW, born in Carlisle, Penn., June 10, 1755; became a member of Congress in 1791, and served as such until 1807, from which year until 1813 he was one of the United States senators from Pennsylvania. In 1816 he was appointed secretary of State of his native State; and he died in 1835.

GREGG, DAVID McMURTRIE an American general, born at Huntingdon, Pa., in 1833. After graduating at West Point in 1855, he served against the Indians in Oregon from 1858 to 1860 as lieutenant. At the outbreak of the civil war he was made captain in the Sixth cavalry regiment, and in January, 1862, he was appointed colonel of the Eighth Pennsylvania cavalry. He served with distinction in the Virginia peninsular campaign, and was made

brigadier-general of volunteers in 1862. From this time on he commanded a division of cavalry, and was engaged at Gettysburg and other important battles. After the Richmond campaign, in which he was engaged with the Second cavalry division, he resigned on Feb. 3, 1865. In 1874 he was sent as United States consul to Prague, Bohemia. In 1866, he became commander of the Pennsylvania order of the Loyal Legion.

GREGG, JOHN IRVIN, born in Bellefonte, Pa., July 19, 1826, served through the Mexican war, becoming first-lieutenant of the 11th infantry in February, 1847, and captain in the following September. At the commencement of the civil war he was chosen colonel of the 5th Pennsylvania volunteers, and in May, 1861, was made captain of the 6th United States cavalry. Appointed colonel of the 16th Pennsylvania cavalry in October, 1862, he commanded a cavalry brigade in the Army of the Potomac from 1863 till 1865. He resigned from the army in 1865, and was brevetted major-general of volunteers, and brigadier-general of the United States Army for distinguished services during the war. Retired in 1879.

GREGORI, LUIGI, artist, was born in Bologna, Italy, July 8, 1819; studied in Rome and at the academy of his native city, and for several years was engaged in the restoration of old paintings in the Vatican galleries. In 1874 he came to the United States and was engaged on the Capitol at Washington, D. C., and in the decoration of a church at St. Louis, after which he became director of the art museum of the University of Notre Dame, Indiana. He remained here for fifteen years, during which he produced many fine works, including the series of Columbian paintings that adorn the main hall of the University. In 1891 he returned to Italy.

GREGOROVIVS, FERDINAND, a distinguished German historian, born in East Prussia in 1821. He studied theology, but soon devoted himself to poetry and literature. In 1852 he went to Rome, where he subsequently spent most of his time. His great work is the *History of the City of Rome in the Middle Ages* (8 vols., 1859-72; 3d ed., 1875). He has written also an Italian geography and a history of Corsica (1854), Capri, and Corfu; on the graves of the Popes (1857; 2d ed. 1881); on Lucrezia Borgia (1874); on Urban VIII (1879); on Athens (1881); and on the Byzantine Empress Athenias (1882); also a tragedy on the death of Tiberius (1881); and an epic, *Euphorion* (4th ed., 1880).

GREGORY, DANIEL SEELEY, educator, born in Carmel, Putnam county, N. Y., Aug. 21, 1832. He graduated at Princeton in 1857, studied theology, and after holding various pastorates became in 1871 professor of metaphysics and logic in Wooster University, Ohio, being transferred four years later to the chair of mental science and English literature. In 1879 he became president of Lake Forest University, Ill. Author of *Christian Ethics* (1875); *Why Four Gospels?* (1876); and *Practical Logic* (1881).

GRELLET, STEPHEN, born of wealthy parents in Limoges, France, Nov. 2, 1773, died in Burlington, N. J., Nov. 16, 1855. He was educated at the military college of Lyons, and at the age of 17 entered the body-guard of Louis XVI. During the Revolution he was taken prisoner and sentenced to be shot, but made his escape to Demerara, and in 1795 came to New York. Formerly a Roman Catholic, he now joined the Society of Friends, and removing to Philadelphia ministered to the sick during the prevalence of yellow fever in 1793. He returned to New York in the following year, and was for a short time engaged in mercantile

pursuits, but soon after devoted himself entirely to missionary work. He made a tour through the Southern and New England States and Canada, and in 1807 went to Europe, where he traveled extensively.

GRENADA, a city and county-seat of Grenada county, Miss. It is a business center and has flour, lumber, planing and rolling mills. Pop. (1890), 2,416.

GRESHAM, WALTER Q., born in Harrison county, Ind., March 17, 1832; was admitted to the bar in 1853. He was elected to the State Legislature in 1860, but resigned to accept a commission in an Indiana regiment. Colonel Gresham was severely wounded at Atlanta and received the brevet of major-general of volunteers for his gallantry. In 1869 he was appointed United States judge for the district of Indiana by President Grant, and in 1880 he was prominently mentioned for United States senator. In April, 1882, he resigned from the bench to become postmaster-general under President Arthur, and on the death of Secretary Folger, in July, 1884, he became secretary of the treasury. In October, 1884, he was appointed United States judge for the seventh circuit, which office he filled with dignity until 1893. On the accession of President Cleveland, March, 1893, Judge Gresham was appointed Secretary of State.

GRETNA GREEN, a village of Dumfriesshire, near the head of the Solway Firth. After the abolition of Fleet marriages, English persons wishing to marry clandestinely had to get out of England, to which alone that act had reference. Thus the practice arose of crossing the border into Scotland, where Gretna Green had by 1771 become "the resort of all amorous couples whose union the prudence of parents or guardians prohibits." The "priest" might be anyone—blacksmith, ferryman, toll-keeper, or landlord—and "church" was commonly the toll-house, where nearly 200 couples were sometimes united in a twelvemonth.

GRÉVY, JULES, ex-president of the French Republic, born in 1807 at Mont-sous-Vaudrez. A prominent jurist, he became a prominent member of the constituent assembly, and opposed the policy of Louis Napoleon as president. From 1871 to 1873 he was president of the national assembly, and from 1876 to 1879 president of the chamber of deputies, in the latter year succeeding Marshal MacMahon as president of the Republic. At the close of the seven-years term of office he was re-elected, and two years later resigned, Dec. 2, 1887. The unexpected fall of Monsieur Grévy was indirectly due to the Limousin or "decoration" scandals. He died September 9, 1891.

GREWIA, a genus of East Indian tiliaceae trees, yielding good bast for rope making, etc. Some yield timber, and the leaves of others are used as fodder.

GREYLOCK, the chief eminence of Saddle Mountain, Berkshire county, Mass. It rises to a height of 3,600 feet, and is the highest point of land in the State. The sides of the mountain are covered with forests.

GRIERSON, BENJAMIN HENRY, born at Pittsburgh, Pa., July 8, 1826; at an early age removed to Ohio, and was afterwards engaged in business at Jacksonville, Ill. At the beginning of the civil war he served on the staff of Gen. Prentiss; in August, 1861, was made major of the 6th Illinois cavalry, and became colonel in the following spring; brigadier-general of volunteers in June, 1863, he became major-general in May, 1865, colonel of the 10th U. S. cavalry in July, 1866, and in March, 1867, was brevetted brigadier and major-general U. S. Army. He commanded the district of the Indian Territory, 1868-73; from 1875 to 1881 was engaged in ex-

ploring parts of New Mexico and Texas, and in campaigns against hostile Indians, and in 1886 was placed in command of the District of New Mexico.

GRIFFIN, a city and county-seat of Spalding county, Ga., 40 miles south of Atlanta. Cotton furnishes the chief industry, and there are factories for the making of furniture and carriages. There is a mineral spring here and the place is a summer resort. The population in 1890 was 4,503.

GRIFFIN, CHARLES, born in Licking county, Ohio, in 1826, died in Galveston, Texas, Sept. 15, 1867. He graduated at the United States Military Academy in 1847, entered the army as brevet second-lieutenant of artillery and served during the Mexican war. In June, 1849, he was promoted first-lieutenant, served on frontier duty, and was instructor of artillery at West Point in 1859-61. In the civil war he commanded the West Point battery at Bull Run, and was brevetted major for gallant conduct; in June, 1862, was commissioned brigadier-general of volunteers, and commanded a brigade in the Virginia peninsula campaign, winning distinction at Yorktown, Gaines's Mill, and Malvern Hill. He was present at the second battle of Bull Run; was promoted to the command of a division and engaged in the battles of Antietam and Fredericksburg, and the various battles of the final campaign. As commander of the 5th corps, under Gen. Grant, he was one of the commissioners to carry out the terms of the surrender of Gen. Lee at Appomattox Court-house. In May, 1865, Gen. Griffin was brevetted brigadier and major-general in the Regular Army, was assigned to the command of the district of Maine in the August following; in July, 1866, was made colonel of the 35th infantry, and commanded military districts in Texas and Louisiana.

GRIFFIN, EDWARD DORR, D.D., born in East Haddam, Conn., Jan. 6, 1770, died in Newark, N. J., Nov. 8, 1837. He graduated at Yale in 1790, studied theology, and in 1795 became pastor of the Congregational church at New Hartford, afterwards holding pastorates at Newark, N. J., and Boston, Mass. He was professor of rhetoric in Andover Theological Seminary from 1809 to 1811, and president of Williams College from 1821 to 1836.

GRIFFIN, SIMON GOODSELL, born in New Hampshire, August 9, 1824, practiced law in Concord until 1860, and entered the volunteer service at the beginning of the civil war. He was at both battles of Bull Run, at Chantilly, Antietam, and Fredericksburg, and after the latter (May, 1863) was given a brigade, with which he operated against Vicksburg. In 1864 he commanded a brigade in the Wilderness, and on June 16th stormed the Confederate lines at Petersburg and captured 1,000 prisoners. He was mustered out as brevet major-general, and in 1866-68 served in the New Hampshire Legislature, being speaker of the lower House for two terms.

GRIFFIS, WILLIAM ELLIOT, DD., an American author, born in Philadelphia, Pa., Sept. 17, 1843; graduated at Rutgers in 1869, and the following year went to Japan. He was superintendent of education in the province of Echizen in 1871, and held the chair of physics in the Imperial University of Tokio in 1872-74. On his return to this country Mr. Griffis studied theology at New Brunswick, N. J., and at Union Theological Seminary, New York city, graduating from the latter in 1877. He was pastor of the First Reformed church in Schenectady, N. Y., from 1877 till 1886, and in the latter year took charge of the Shawmut Congregational church, Boston, Mass.

GRIFFITHS, JOHN WILLIS, naval architect, born in New York city, Oct. 6, 1809, died in Brooklyn, N. Y., April 29, 1882. Early apprenticed to a ship-

wright, at 19 years of age he laid the lines of the frigate *Macedonia*. He suggested the clipper model of the fast ships built for the China trade; in 1853 he began the construction of a steamer which when completed made the fastest time on record between Havana and New Orleans. In 1858 he was appointed by the Government special naval constructor to build the gunboat *Pawnee*, and in 1872 built the United States ship *Enterprise*. Mr. Griffiths was the originator of the idea of life-boat steamers; and the inventor of a timber-bending machine, iron keelsons for wooden ships, bilge keels to prevent rolling, triple screws for great speed, and improved rivets.

GRIGGSVILLE, a city of Pike county, Ill., 4 miles west of the Illinois River. It has manufacturing of implements, carriages and flour. Pop., 1,400.

GRIGORIOPOL, a town of Kherson, South Russia, on the left bank of the Dniester, eighty-two miles northwest of Odessa. Its 7,918 inhabitants cultivate tobacco, wine and fruit.

GRIGSBY, HUGH BLAIR, born in Norfolk, Va., November 22, 1806; represented his native county in the legislature and State convention and devoted himself to literature. In 1871 he became chancellor of William and Mary College. He died April 28, 1881.

GRIMES, JAMES WILSON, statesman, born in Deering, Hillsborough county, N. H., Oct. 20, 1816, died in Burlington, Ia., Feb. 7, 1872. He graduated at Dartmouth College in 1836, and soon afterwards settled to the practice of law in Burlington, Ia., in what was at that time known as the "Black Hawk Purchase," which was attached to the territory of Michigan. After the formation of Iowa Territory, Mr. Grimes was a delegate to its assembly in 1838 and 1843, and in 1852 was a member of the State legislature. Elected governor of the State in 1854, he fostered Free-soil sentiments, addressed a remonstrance to President Pierce against outrages perpetrated in Kansas upon former citizens of Iowa, and secured action upon measures which materially promoted the development of the State. He was elected to the United States Senate as a Republican in 1859, was a delegate to the peace convention in 1861, and in 1865 was reelected to the Senate. As a member of the committee on naval affairs he became a recognized authority on matters pertaining to the navy, and was the first in the Senate to suggest the introduction of iron-clad vessels. Mr. Grimes was compelled by failing health to resign his seat in the Senate in 1869.

GRIMKÉ, SARAH MOORE, born in Charleston, S. C., Nov. 6, 1792, died at Hyde Park, near Boston, Mass., Dec. 23, 1873. Becoming convinced of the evils of slavery, she left her home and in 1821 went to Philadelphia, where she became one of the most prominent members of the Anti-Slavery Society.

GRIMKÉ, THOMAS SMITH, LL.D., born at Charleston, S. C., Sept. 26, 1786, died near Columbus, Ohio, Oct. 11, 1834. He graduated at Yale College in 1807, studied law in Charleston, and attained distinction at the bar. As a member of the State Senate he made a notable speech in support of the general government on the tariff question, and an argument on the South Carolina test-oath question. He was a strong advocate of the temperance cause, a distinguished member of the American Peace Society, and a fine classical scholar. Author of *Addresses on Science, Education and Literature* (1831).

GRINNELL, a city of Poweshiek county, Iowa, 120 miles west of the Mississippi River. It is the seat of Iowa College, and has a foundry, flour mills, and a glove factory. Pop. (1890), 3,332.

GRINNELL, HENRY, born in New Bedford, Mass., in 1800, died in New York city, June 30, 1874. He graduated at the academy in his native place in 1818, and going to New York became a clerk in a commission house. In 1825 he was made a partner in the firm of Grinnell, Minturn & Co., retiring from business in 1852. He was greatly interested in Arctic exploration, and in 1850 fitted out two vessels at his own expense to aid in the search for Sir John Franklin and his companions. He also contributed freely to subsequent expeditions. Mr. Grinnell was throughout life a generous advocate of the interests of sailors, and was the first president of the American Geographical Society.

GRINNELL, MOSES HICKS, brother of Henry, born in New Bedford, Mass., March 3, 1803, died in New York city, Nov. 24, 1877. He was educated at private schools and at the Friends' Academy, and in 1818 entered a New York counting-house. He became a member of the firm of Fish & Grinnell in 1825; was a member of Congress, 1839-41; collector of the port of New York, 1869-70, and president of the chamber of commerce in 1843. He contributed toward Dr. Kane's Arctic expedition of 1853, and was a liberal supporter of the national cause during the civil war.

GRINNELL LAND, a barren mountainous Polar tract on the west side of Kennedy channel, the northern continuation of Smith's Sound. It was discovered by Dr. Hayes of Kane's expedition in 1854, and named after Henry Grinnell, of New York, who had fitted out the expedition. It was thoroughly explored by Greely in 1882. North and south it is covered with ice caps; between them lie valleys that are free of snow in summer and support herds of musk oxen and the usual Arctic fauna. In the interior he discovered Lake Hazen, 60 miles long, and two ranges of mountains, one containing a peak, Mount Arthur, 5,000 feet high.

GRIPING, or GRIPES, a popular name for all painful affections of the bowels, whether attended with constipation or diarrhoea. When pains of this kind are spasmodic they are termed colic. The action of purgative medicine is often attended by more or less griping pain, which may be averted in certain cases by the careful choice of the medicine, or by the combination of it with carminatives, or with a little opium.

GRIPPE, LA. See INFLUENZA, in Britannica, Vol. XIII, p. 73; also, in these Revisions and Additions.

GRIQUAS, a South African race of half-castes, the offspring of Hottentot and Bush-women by colonists of Dutch descent. They form a distinct community in a region known as Griqualand, annexed to Cape Colony in 1874. Many of the Griquas are considerably civilized, have adopted the Christian religion, and are successful agriculturists and cattle-breeders.

GRISCOM, JOHN HASKINS, M. D., born in New York city, Aug. 14, 1809, died there April 28, 1874. He graduated from the medical department of the University of Pennsylvania in 1832; was professor of chemistry in the New York College of Pharmacy from 1836 to 1840, and in 1843 became visiting physician of the New York hospital. Author of *Animal Mechanism and Physiology* (1839); *Uses and Abuses of Air* (1850); *Prison Hygiene* (1868); and other works. He also contributed largely to the medical journals.

GRISEBACH, AUGUST HEINRICH RUDOLPH, a German botanist, born at Hanover in 1814, died May 9, 1879. He studied botany and medicine at Göttingen and Berlin; was employed by the government in 1839 to explore the flora of Turkey; traveled extensively in pursuit of this mission, and in

1841 was appointed professor of botany at Göttingen and director of the botanical garden. He published *Reisedurch Rumelien* (2 vols., 1841); *Spiegleium Flora Rumelicae* (2 vols., 1843-45); *Ueber die Bildung des Torfs* (1846); and *Die Vegetationslinien des nord-westlichen Deutschlands* (1846), etc.

GRISI, GIULIA, a celebrated singer, born at Milan in 1810, died at Berlin in 1869. Her fame spread rapidly over Europe; in 1832 she appeared in Paris in *Semiramis*, where the purity, melodiousness and volume of her voice, as well as her classical beauty of features, secured general admiration. Bellini's *Puritani* and other operas were written for her, but *Norma* always remained her greatest part. London was the scene of her grandest and most successful performances; and here she married, in 1836, the Marquis de Melce, after whose death she became in 1856 the wife of the tenor, Mario, with whom she sang in America.

GRIS-NEZ CAPE, a headland in the French department of Pas-de-Calais, opposite Dover, and the point of land nearest to the English shore, the distance being barely 20 miles. About equally distant from Calais on the northeast and Boulogne on the south, the cape marks the dividing line between the North Sea and the English Channel. It is surmounted by a light-house.

GRISWOLD, ALEXANDER VIETS, D. D., born at Simsbury, Conn., April 22, 1766, died at Boston, Mass., Feb. 15, 1843. He first studied law, but, disliking the profession, prepared for the ministry, and was ordained in 1795. He had charge successively of the parishes of Plymouth, Harwinton, and Litchfield, Conn., and in 1804 accepted a call to the rectorship of St. Michael's church, Bristol, R. I. In 1811 he was consecrated first bishop of the eastern diocese of the Protestant Episcopal church, and on the death of Bishop White in 1836 became the presiding bishop. He published *Discourses on the Most Important Doctrines and Duties of the Christian Religion* (1830); *The Reformation and the Apostolic Office* (1843); and various special sermons and addresses.

GRISWOLD, RUFUS WILMOT, D. D., born at Benson, Vt., Feb. 15, 1815, died in New York city, Aug. 27, 1857. In early life he traveled in the United States and Central and Southern Europe; was apprenticed to a publisher, but tiring of the business studied theology, and became a successful minister of the Baptist denomination. Leaving the ministry for journalism, he edited "Graham's Magazine," Philadelphia, from 1841 till 1843; was afterwards associate editor of several weekly papers in Boston and New York city, and in 1852 became editor of the "International Magazine." His works include *Poets and Poetry of America* (1842); *Poets and Poetry of England in the 19th Century* (1845); *Washington and the Generals of the Revolution*, in connection with other writers (1847); *Sacred Poets of England and America* (1849); and a number of other works. He also compiled *Curiosities of American Literature*, edited the first American edition of Milton's prose works, and was one of the editors of the works of Edgar A. Poe.

GRISWOLDVILLE, a village of Jones county, Ga., on the Central Railroad, 10 miles from Macon. Before the civil war it was noted for extensive manufacture of cotton-gins. Here a sharp engagement occurred, between the Confederate and Union forces, Nov. 22, 1864.

GRODEK, a town of Austrian Galicia, 20 miles from Lemberg, in the center of a flax-growing region. Population (1880), 10,116; nearly one-third Jews.

GROOTE EYLANDT (Dutch, "Great Island"); an uninhabited island on the west side of the Gulf

of Carpentaria, in North Australia. It is surrounded by reefs, and its interior is hilly. In extreme length and breadth it measures about 40 miles each way.

GROS-VENTRE INDIANS. See INDIANS, AMERICAN, in these Revisions and Additions.

GROSS, SAMUEL DAVID, M. D., born near Easton, Pa., July 8, 1805, died in Philadelphia, May 6, 1884. He graduated at Jefferson Medical College in 1828, in 1835 became professor of pathological anatomy in the Cincinnati Medical College, Ohio; in 1840 accepted the professorship of surgery in the University of Louisville, Ky., and in 1850 was chosen Dr. Mott's successor in the University of New York. Six years later he became professor of surgery in Jefferson Medical College, Philadelphia, which position he held until within two years of his death. Dr. Gross was a member of the Royal Medical Society of Vienna; of the Royal Medico-chirurgical Society of London; and of the British Medical Association. He was president of the American Medical Association in 1867, and president of the International Medical Congress held in Philadelphia in 1876. He received the degree of D. C. L. from the University of Oxford, England, and that of LL. D. in this country. He commenced in early life to contribute to medical literature, and was the author of a number of well-known professional works.

GROSS, SAMUEL W., son of the foregoing, was born in Cincinnati in 1831, served in the Union army as brigade surgeon, and was brevetted lieutenant-colonel. He was attached to several colleges in Philadelphia as surgeon and professor of clinical surgery, and has written many valuable papers on anatomy and diseases of various organs.

GROSS, WILLIAM HICKLEY, born in Baltimore, June 13, 1837, entered the Redemptorist order in 1857, and was ordained priest in the Roman Catholic Church in 1863. On April 27, 1873, he was consecrated bishop of Savannah, and in 1884 became archbishop of Oregon.

GROTTE, LE, a town of Sicily, in the province of Girgenti. Population, 8,775, mostly employed in the sulphur works of the district.

GROUND-ANNUAL: in the law of Scotland, an annual payment made for land. It is little known where the law allows the constitution of a feuduty. Thus, when a vendor sells his land, and instead of taking a lump sum for the price prefers a sum by way of a perpetual annuity or rent, he conveys the land in fee to the disponent or purchaser subject to this ground-annual, which is the burden on the lands transferable and extinguishable like other real burdens. The vendor is then called the ground-annualler, and if the ground-annual is not paid he is entitled, as a remedy, to poind the ground—that is, seize all the goods whether of the owner or his tenants, which are found on the lands, and pay himself, and raise action of mails and duties against the tenant, or he may sue the debtor.

GROUND DOVE, a dove or pigeon, which lives chiefly upon the ground. In the United States it is one of several small pigeons of the genus *Columbigallina*, especially *C. passerina* of the Southern States. It is less than seven inches long, has short broad wings and tail, and naked tarsi. The plumage of the male is varied with tints of purplish-red and grayish-olive; the female is gray in color. It usually nests on the ground.

GROUND-IVY (*Glechoma hederaceae*), a plant of the natural order *Labiatae*, a native of Britain and other parts of Europe, growing in hedges, etc., in a dry soil, and naturalized in America. It has a creeping stem, kidney-

shaped crenate leaves, and axillary blue flowers growing in threes. A tea prepared from the leaves is in great repute among the poor in many places, and the plant is supposed to be stimulant, aromatic, and of use in pectoral complaints. The leaves were formerly used in England for clarifying and flavoring ale.

GROUNDLING (*Cobitis taenia*), the spinous loach, a little cyprinoid fish resembling the loach, from which it is distinguished by a forked erectile spine beneath the eye, and by its more compressed form. It is rare and very local in Britain, frequenting the muddy parts of rivers, habitually keeping close to the bottom. The genus is known to include only two other species.

GROUND PARAKEET, one of several Australian parrots, living mainly upon the ground, and belonging to the genus *Pezoporus*, or the genus *Geopsittacus*.

GROUND SQUIRREL, one of the various species of burrowing rodents of the genera *Tamias* and *Spermophilus*, especially applied in the United States to the Eastern striped squirrel or chipmunk, *Tamias striatus*. The genus *Spermophilus* includes the prairie squirrel and many allied Western species, commonly called gophers.

GROVE, SIR GEORGE, an English author, born in 1820. He was trained as an engineer, and erected in the West Indies the first two cast-iron light houses built. He was next employed on the Chester general station and the Britannia tubular bridge. From 1849 to 1852 he was secretary of the Society of Arts, and to the Crystal Palace company from 1852 to 1873. He was knighted in 1883 on the opening of the Royal College of Music, Kensington Gore, of which he was made director by the Prince of Wales. He assisted Dean Stanley in some of his works on the Bible and the East, and was founder of the Palestine Exploration Fund. He was an editor of "Macmillan's Magazine," a contributor to Smith's *Dictionary of the Bible*, and an editor (and part author) of the great *Dictionary of Music and Musicians*.

GROVE, SIR WILLIAM ROBERT, an English lawyer and physicist, born in 1811. In 1835 he was called to the bar; in 1871 was raised to the bench, receiving knighthood in 1872; and in 1875 became a judge in the high court of justice. He retired from the bench in 1887. In 1839 he invented the powerful voltaic battery known by his name, and from 1840 to 1847 was professor of natural science at the London Institute. He has contributed extensively to scientific journals, and published several very important lectures. He was president of the British Association in 1866.

GROW, GALUSHA A., born at Ashford, Windham county, Conn., Aug. 31, 1824, graduated at Amherst College in 1844, studied law, and was admitted to the bar in 1847. He was member of Congress from Pennsylvania in 1851, and represented his district for twelve successive years. Elected as a Democrat, he severed his connection with his party on the repeal of the Missouri compromise. During his period of office he rendered important services on various committees, and was Speaker of the House in 1861-63. He was a delegate to the National Republican conventions of 1864 and 1868.

GROWLER (*Grystes salmonoides*), a fish of the perch family, abundant in many of the rivers of North America. It attains a length of two feet, and is much esteemed for the table. It is of an olive color. The genus *Grystes* has small scales, and only fine villiform teeth. Nearly allied is the genus *Oligorus*, including the valuable murray cod (*O. macquariensis*), which may attain a length of three feet and a weight of a hundred pounds, and a

New Zealand coast form, the hapuku (*O. gigas*), also valuable as a food-fish.

GRUB, the name generally applied to the worm-like larvæ of insects when they have a distinct head but no legs, as bees and some beetles. The economic importance of many grubs, especially those of some beetles, is well known.

GRUNDY CENTRE, the capital of Grundy county, Iowa, situated on a railroad, about 22 miles from Cedar Falls.

GRUNDY, FELIX, born in Berkeley county, Va., Sept. 11, 1777, died in Nashville, Tenn., Dec. 19, 1840. He was educated by Dr. Joseph Priestly at Bardstown Academy, studied law, and achieved a great reputation as a criminal lawyer. He was chosen a member of the Kentucky constitutional convention in 1779, was a member of the legislature from 1799 till 1806; in the latter year was appointed a judge of the supreme court of errors and appeals, and in 1807 became chief justice. This position he soon after resigned, removing to Nashville, Tenn. He was a member of Congress (1811-15), United States Senator (1829-38), and Attorney-General in Van Buren's Cabinet. In 1840 he resigned his position in the cabinet and was reelected to the Senate.

GUACHOS, a name given to descendants of the early Spanish colonists and native Indians, inhabiting the pampas of South America. They live in mud huts, and are solely occupied in rearing cattle.

GUADALUPE RIVER rises in the southern part of the State of Texas, and flows in a southeast direction, emptying its waters into Espiritu Santo Bay. Its length is estimated at about 200 miles.

GUADALUPE-Y-CALVO, a town of Mexico, situated in a mountainous district in the State of Chihuahua. It derives importance from the rich silver-mines in its vicinity. Population, 10,000.

GUANARE, the capital of the State of Zamora, in Venezuela. It stands on a river of the same name, and has a population of 10,890.

GUANO, or VILLA GUANO, a town of Ecuador, province of Chimborazo, situated on the Rio Guano, 100 miles southwest of Quito. It produces various manufactures. Population, 9,000.

GUAPORÉ, a navigable river of South America, rising in Brazil, and for some distance forming the boundary between Bolivia and Brazil. It unites with the Mamore to form the Madeira.

GUARANTY, a term in international law applied to the promise given by the third power of a treaty to aid in case of the violation of its provisions by either of the others. It requires that the degree and amount of aid promised shall be given unless the promisee decline to receive it. The promiser differs from a surety in not being bound to make good a debt, but only to do his best to induce the party owing it to make payment. See *Britannica*, Vol. XI, p. 236.

GUADAFUI, CAPE, the most eastern point of the African continent, and the extremity of an immense promontory (the Somali country), stretching seaward in an east-northeast direction, and washed on the northwest by the Gulf of Aden and on the southeast by the Indian Ocean. The cape is in 11° 50' N. lat., and 51° 14' E. long.

GUATEMALA, a republic of Central America, long in an unsettled condition, politically. For its history and natural features, see *Britannica*, Vol. VIII, pp. 238-242. Guatemala is divided into twenty-two departments, under civil governors. The executive is vested in a president, elected for six years by direct popular vote; he appoints six secretaries of state, who with nine others form the council. The assembly is elected by universal suffrage, to the number of one for every 20,000 of

the population. The standing army consists nominally of 3,700 men, the militia of nearly 65,000. This force is a heavy drain on the resources of the country, whose finances are not in a flourishing condition. In 1890 the net public revenue was \$6,638,336, and the expenditure was \$8,300,338; but the internal debt was returned at \$6,495,062, the floating debt at \$5,554,995, and the foreign debt at \$4,613,500—making a total of \$16,663,557, including past interest. To meet the increase in the floating debt, which had grown up since 1887, in 1889-90 about three million dollars of paper money was put in circulation. On the other hand, since 1887 the interest on both the internal and the foreign debt has been punctually paid, and the bonds have risen in value.

From 1871 until he was killed in a war with Salvador in 1885, General Barrios was president, and under his iron rule the country made considerable progress; monastic orders were rigorously suppressed, and much of the church property was confiscated and appropriated to the uses of public education and for other purposes. There have been three or four nominal presidents, and as many revolutions, since the death of Barrios. There are at present only two short lines of railway (100 miles) in operation; a line from Puerto Barrios, on the Atlantic, to Guatemala city, to connect the Atlantic with the Pacific, was commenced in 1884, but in the meantime has been abandoned. In 1888 there were in the republic 157 post offices, and over 2,000 miles of telegraph. In May, 1892, President Harrison concluded a treaty of commercial reciprocity between the United States and Guatemala. Our imports from that country consist of coffee, dyewoods, rubber, indigo and drugs. We export to it a few manufactured goods, but its chief market is Great Britain.

GUELPH, a post-town of Ontario, Canada, county-seat of the county of Wellington, on the Speed, at a railway junction, 48½ miles west of Toronto. The Speed here falls about 30 feet, furnishing water-power to several large mills and factories. The town has also manufactories of iron castings, machinery, sewing-machines, musical instruments, leather, agricultural implements, soap and candles, boots and shoes, and wooden-ware. Guelph is an inland port of entry. Population in 1886, 10,216.

GUERANDE, a town of France, in the department of Loire-Inférieure, near the sea. It contains a mediæval church, and has manufactories of salt and linen. Population, 6,912.

GUERARA, a town of Algeria, in the oasis of Wady-Mزاب, 42 miles from Gardaia. It is the rendezvous for the tribes of the desert to buy and sell horses, sheep, and asses, and to exchange ivory, gold dust, and ostrich feathers for cottons, woollens, silk, and cutlery. Population estimated at 12,000.

GUERICKE, HEINRICH ERNST FERDINAND (1803-78), a German theologian belonging to the Old Lutheran school. He was professor at Halle, and is the author of a *Handbuch der Kirchengeschichte* (1853); of a *Christliche Symbolik* (1839); and of a *Lehrbuch der Christlichen Archæologie* (1847).

GUERRERO, VICENTE, President of Mexico, born in Tixtla, Mexico, in 1783, died in Cuilapam, Feb. 14, 1831. He took part in an insurrection in 1809; subsequently gained several victories over the Spaniards, and in 1818 became a leader of the patriotic troops. In 1829 he was declared President of Mexico. He was soon afterwards deposed in favor of Santa Anna and fled to the south, but was afterwards captured and shot.

GUERRILLA, properly an armed band carrying on an irregular, unauthorized warfare on occasions

of invasion or civil war, but now commonly an individual member of such a band. The word first came into popular use in Spain, where it was applied to the bands of peasants and shepherds who opposed Napoleon's armies in 1808-14; and they were active partisans of the Carlist cause in the civil wars of Spain. The name was brought to Spanish America, and thence introduced into the United States. In the late civil war there were numerous guerrillas in the border States.

GUESS, GEORGE, or SEQUOYAH, a Cherokee half-breed, inventor of the Cherokee alphabet, born about 1770, died in San Fernando, Northern Mexico, in August, 1843. He knew no language but his own, and was only known as an ingenious silversmith previous to his invention of the alphabet. This alphabet is considered to be the most perfect one ever devised, and consists of eighty-five characters, each representing a single sound. It has been employed in printing with complete success. Guess went with his tribe beyond the Mississippi, and emigrated with other Indians to Mexico in 1842.

GUEUX, or "THE BEGGARS," the name assumed by the confederated nobles who opposed the introduction of the Inquisition into the Low Countries by Philip II, of Spain. Forming themselves into an association, they presented a formal protest to the regent, Margaret of Parma. They represented the national feeling of the country, and maintained a long and vigorous contest against the despotic proceedings of Philip, but were compelled to succumb to superior force. "The Beggars of the Sea" seriously harassed the Spanish fleet, and succeeded besieged places along the coast. Their capture of Briel in April, 1572, was the beginning of the war which terminated in the independence of the Netherlands in 1648.

GUIANA, or GUAYANA, a region of South America comprised between the Orinoco and Amazon Rivers (see Britannica, Vol. XI, pp. 249-55). The name is now usually confined to the European provinces, British Guiana, Cayenne, or French Guiana, and Surinam, or Dutch Guiana. Guiana was the "El Dorado" of Sir Walter Raleigh, and formerly supposed to be rich in gold. Gold is still found in the interior, in the Sierra Parime, but the true wealth of Guiana lies in its fertile soil and its boundless capabilities in regard to tropical produce. Much of the interior is still unexplored.

BRITISH GUIANA has an area of 109,000 square miles, and a population (1891) of 284,887. In 1890 there were 81,486 acres under cultivation, as follows: Sugar, 78,110 acres; village acres, 12,833; and 92 cattle farms. The exports and imports for five years (1886-90) were as follows:

Goods.	1886.	1887.	1888.	1889.	1890.
	£	£	£	£	£
Exports	1,842,585	2,190,562	2,024,733	2,310,141	1,842,585
Imports	1,436,297	1,603,175	1,566,055	1,803,776	1,436,297

The chief exports in 1890 were: Sugar, £1,914,143; rum, £165,854; molasses, £66,020; timber, £18,978; gold, 28,282 oz., valued at £109,234. The chief imports were: Flour, £136,899; rice, £192,065; pork, £56,888; butter, £18,868; lumber, £38,538. In 1889 there were 23 miles of railway, 275 miles of post office telegraphs, and a telephone exchange in George Town of 240 miles, with 200 subscribers.

CAYENNE, or FRENCH GUIANA, has an area of 46,697, and a population of 26,502. The capital and

chief city is Cayenne. The exports to France amount to about \$3,750,000 annually. Cayenne was selected as a station by the Royal Astronomical Society as a point of observation of the total solar eclipse, Dec. 21 and 22, 1889.

SURINAM, or DUTCH GUIANA, has an area of 46,060 square miles, and a population (1889) of 57,365. The capital and chief city is Paramaribo, with 27,752 inhabitants. The superior administration and executive authority is in the hands of a governor, assisted by a council composed of the governor as president, the attorney-general as vice-president, and three members, all nominated by the king. The colonial states form the representative body of the colony. Four members are chosen every year by the governor; the others by electors, in proportion of one in 200 electors. Entire liberty is granted to the members of all religious confessions. The local revenue is derived from import, export and excise duties, taxes on houses and estates, personal imposts, and some indirect taxes. A subvention from the mother-country is necessary. For 1890 the estimated revenue was 13,408,130 guilders, and the expenditures 1,647,153 guilders. The following table shows the value of imports and exports during the years 1885-89:

Year.	Imports.	Exports.
1885	4,808,603 guilders.	3,113,270 guilders.
1886	4,592,714 "	3,036,533 "
1887	5,052,621 "	3,639,509 "
1888	4,346,840 "	3,316,377 "
1889	4,893,355 "	3,521,867 "

In 1889 sugar was produced on 114 plantations of 1,668 hectares to the amount of 7,507,649 kilogrammes. Cacao on 88 plantations and 370 small properties of 8,787 hectares, to the amount of 1,543,019 kilogrammes. The other productions were bananas, 516,799 bundles; coffee, 5,560 kilogrammes; cotton, 720 kilogrammes; rice, 15,197 kilogrammes; fruits, 186,812 kilogrammes; rum, 315,306 litres; and melasse, 1,104,389 litres. The export of gold in 1889 was 894,333 grammes, valued at 1,410,795 guilders. The declared value since the beginning of the gold industry (1876) to the end of 1889 is 12,472,808 guilders.

GUIANA BARK, FRENCH, the bark of *Portlandia hexanára*, also called *Conteria speciosa*, a tree of the natural order *Cinchonaceæ*, with opposite ovate leaves, and corymbs of very large purple flowers, a native of Guiana. The bark is esteemed a very powerful febrifuge.

GUIDES, in military affairs, are usually persons drawn from the country in which an army is operating, one or more being sent with every detachment of troops. A guide should be intelligent, experienced in the topography of the country, and faithful. As, however, guides must on many occasions be drawn from a hostile population, their conduct is always watched with the utmost jealousy, death being the punishment for the least departure from trustworthiness.

GUIGNIAUT, JOSEPH DANIEL, a French scholar and antiquary, born at Paray-le-Monial, May 15, 1794, died in Paris, March 12, 1876. In 1818-22 he held the position of *maître des conférences* in history at the normal school, and the corresponding chair in Greek letters, 1826-28. He was chosen to the Academy of Inscriptions in 1837, and in 1862 was made its perpetual secretary; in 1847 received the cross of an officer of the Legion of Honor. He wrote much on Greek literature.

GUITEAU, CHARLES JULES, assassin of President Garfield, was born in Freeport, Ill., Sept. 8, 1841. He was admitted to the bar, but achieved no success as a lawyer, and published some pamphlets setting forth his views on various moral questions, which were of the most erratic character. He married, but his wife obtained a divorce from him, and he obtained a precarious living by lecturing and writing. He had been a member of the Oneida Community, but was expelled from that body. Guiteau became an office-seeker and persistently solicited an appointment as consul from President Garfield. Enraged at being refused, he lay in wait for the president and shot him, July 2, 1881. He was tried in Washington, D. C., found guilty of murder, and executed June 30, 1882.

GULES (*gueules*, the French heraldic term for "red," is the plural of *gueule*, "the mouth." Lat. *gula*), the term by which the color red is known in heraldry.

GULFWEED (*Sargassum*), a genus of seaweeds (*Algæ*), of the sub-order *Fucaceæ*, of which two species are found in immense quantities in some parts of the Atlantic, Pacific and Indian Oceans. They are tropical plants, although sometimes carried by winds and currents to northern coasts. The frond is long, and is furnished with distinct stalked nerved leaves, and simple axillary stalked air-vessels. The receptacles are linear, in small axillary clusters or racemes. The gulfweed is generally found floating, but there is reason to think that it is at first attached to the bottom of shallow parts of the sea.

GULL, SIR WILLIAM WITHEY, was born in 1816, at Thorpe-le-Soken, Essex. He was educated privately, and subsequently pursued his medical studies at Guy's Hospital. He graduated M. D. in 1846, at the London University. Doctor Gull was professor of physiology at the Royal Institution of Great Britain in 1847-9; was elected a fellow of the Royal College of Physicians in 1848; and for twenty years acted as physician and lecturer to Guy's Hospital, retiring from that position about 1867. In 1872, he was created a baronet, in recognition of services rendered by him during the illness of the Prince of Wales, and in the following month was appointed one of her majesty's physicians extraordinary. He held other positions of honor and profit and wrote some medical works of high value. His specialty was in clinical practice. He died in 1890, leaving the largest fortune ever amassed by a practicing physician.

GUMMING (in vegetable pathology, *Gummosis*), a disease which attacks the plum, cherry, peach, and other stone-fruit trees, often proving fatal to the tree. Recent observations seem to prove that the cause of the disease is a fungus named *Coryneum Beijerinckii*. The mycelium of the fungus develops a ferment which transforms the cell-walls, starch granules, and other contents of the cells into gum. The fungus cannot penetrate sound, healthy bark; there must be some wound or abrasion before the germ-tubes can enter the cellular tissues in which alone they can spread; probably insects are the chief agents in carrying the contagion from tree to tree. Wounds as soon as they are observed should be coated with a thick paste of quicklime or coal-tar. Gummed branches should be cut away without delay and burned, and the wounds dressed at once with coal-tar.

GUM-PLANT (*Grindelia robusta*). This plant is one of a genus of the order *Compositæ*, named in honor of Dr. Grindel, a German botanist. It inhabits the dry regions of the American continent from the Mississippi River to the Pacific coast. There are about 25 species of *Grindelia*. Some are

found as far north as the Saskatchewan, in the British possessions, while Patagonia seems to be the limit on the south. The chief home of the gum-plant seems to be in Texas and Mexico. It has a pappus composed of 2 to 8 rigid, hornlike awns, which are early deciduous. The leaves are rather thick, and often covered by a viscid exudation, or gum. California has four species of this genus. In medicine it has gained popularity in the West as a remedy for poisoning by species of *Rhus*, as the poison-oak of California, and in asthma and bronchitis.

GUM-TREE, a name applied in the United States to various important trees. The sour gum, black gum, pepperidge, or tupelo (*Nyssa multiflora*), is a large tree, producing a firm timber, which is used for hat-blocks, windmill shafts, hubs, etc. The *Nyssa capitata* bears a sour, edible fruit. The *Nyssa uniflora* and *aquatica* have soft, light wood, and their roots are used somewhat as substitutes for cork. The *Liquidambar styraciflua*, the sweet gum, is a large tree with star-like leaves. The firm and fine-grained wood is used in furniture-making. It yields a balsamic resin, called American storax. *L. orientale* and *L. altingia* also yield storax, and the latter has a hard, heavy, fragrant red timber. Gum-trees are common in nearly every quarter of the globe.

GUNBOAT, a small boat or vessel armed with one or more guns of heavy caliber. From its small dimensions, it is capable of running close inshore or up rivers, and from the same cause it has little chance of being hit by a larger vessel at the long range which the carrying power of its guns enables it to maintain. At the outbreak of the Russian war, a large squadron of them was hastily constructed for the British navy for the first time. Their tonnage was small; and their armament usually consisted of one 8-inch gun and one 100-pounder Armstrong gun. Gunboats in their more modern form are small, mastless vessels mounting one large gun in the bow, and propelled by an engine with single or twin screws. The gun is pointed by means of the helm or the screws, and the gunboat is in fact a floating gun-carriage. In the British navy these gunboats carry an armor-piercing gun of 18 tons, on a draught of only 4 feet. But they have been designed to carry 35-ton guns, or heavier. In 1893 there were on the British Navy List 114 of these vessels, of which 43 were called third-class, and are intended for coast defense. The largest size of the first-class gunboats then in commission or building were of 735 tons and 4,500 horse-power. At the beginning of the century the United States had over 250 of these vessels; but the "gunboat system" was soon abandoned. In 1893 there were attached to the United States navy only six vessels called gunboats, all of the fourth rate, and including one torpedo ram; and two gun-vessels of 1,200 tons, newly built. Most continental navies are provided with gunboats of various size and construction.

Following are the names and description of the six vessels listed as gunboats in the "new" navy of the United States, Jan. 1, 1893:

Yorktown—Gunboat; D., 1,700; H. P., 3,500; cost, c\$455,000. Armament, 6.6-in. B. L. R.; 2 6-pdr., 2 3-pdr., 1 1-pdr. R. F.; 2 37-mm. H. R. C.; 2 Gatlings. In commission.
Petrel—Gunboat; D., 890; H. P., 1,513.41; cost, c\$247,000. Armament, 4.6-in. B. L. R.; 2 3-pdr., 1 1-pdr. R. F.; 2 37-mm. H. R. C.; 2 Gatlings. In commission.
Concord—Gunboat; D., 1,700; H. P., 3,405; cost, c\$490,000. Armament, same as Yorktown. In commission.
Bennington—Gunboat; D., 1,700; H. P., 3,533; cost, c\$490,000. Armament, same as Yorktown. In commission.
Machias—Gunboat; D., 1,050; H. P., 1,600; cost, c\$318,500. Armament, 8 4-pdr. R. F. B. L.; 4 6-pdr., 2 1-pdr. R. F.; 2 Gatlings. Completing at Bath Iron Works.

Castine—Gunboat; D., 1,050; H. P., 21,600; cost, c\$318,500. Armament, same as *Machias*. Completing at Bath Iron Works.

The initials, etc., used in the descriptions are explained as follows:—

a Estimated. b Limit of cost. c Contract price. D displacement. R. F. B. L. R. Rapid-firing breech-loading rifles. B. L. R. Breech-loading rifles. R. C. Revolving cannon. R. F. Rapid-firing cannon. mm. Millimetre, 39-1000ths of an inch.

GUN COTTON. There are now a very large number of explosive nitro-compounds, which may be divided into two main classes, viz., (1) those containing nitro-glycerin, in which is included the great dynamite class, and (2) those not containing nitro-glycerin. Gun cotton is an explosive nitro-compound of the latter class, and is by far the most important of the class.

Schönbein's discovery of gun cotton in 1845 gave a great impetus to the question and experiments continued to be made by many eminent chemists in nearly every country in Europe, with the idea of utilizing the new explosive for military purposes. It was first manufactured in England on a large scale in the year 1847 by Messrs. Hall & Son, of Faversham; but, in addition to the minor accidents, a terrible explosion took place in their works, which created so much distrust that the manufacture in England was discontinued for several years, as the cause of the explosion, with the then imperfect knowledge possessed of the subject, could not be satisfactorily accounted for. The first country to turn Schönbein's discovery to practical account was Austria. General Von Lenk, an Austrian artillery officer, after extensive trials succeeded in greatly improving the method of manufacture, by which means he was enabled to moderate and insure a uniform rate of combustion of gun cotton in air. His discovery was considered of so much importance that in the year 1852 several batteries of Austrian artillery were armed with gun cotton cartridges. But it soon fell into disrepute, not only on account of its unstable nature, but also because it was found that Von Lenk's improvements were of no practical utility when the gun-cotton was confined in the bore of a gun; the great heat generated caused the inflamed gas to penetrate rapidly through the whole cartridge, so that there was little or no retardation in the rate of combustion, and the rapid combustion caused excessive pressure in the bore, besides giving very unequal results when fired.

Since the failure of the Austrian cartridges, gun cotton has not been used as a propelling agent on a large scale. But its utility as a disruptive agent has been enormously increased by the discoveries of Professor Sir Frederick Abel and the late Mr. E. O. Brown. Nothing daunted by the failure of the Austrian experiments, nor by the explosion at Messrs. Hall's works, Sir Frederick Abel continued his experiments, and he ultimately discovered a method of manufacture whereby not only a complete purification from free acid is assured, but the material is converted into thoroughly compact homogeneous masses.

The properties of gun cotton as compared with gunpowder, are mainly as follows: (1) It can be ignited at a temperature of about 800°, whereas gunpowder requires a temperature of about 600° to insure ignition; (2) its combustion leaves no solid residue, and is unattended by smoke; (3) the action of gun cotton is much more rapid than that of gunpowder, and, as has already been pointed out, it is this rapidity of combustion which renders it unsuitable to be used as a propelling agent in cannon; (4) whereas gunpowder is greatly influenced and injuriously affected by moisture, gun cotton

on the contrary is perfectly uninjured, and may be kept for any length of time in water without change. For military purposes this is a most important consideration. Apart from the question of using gun cotton as a propelling agent, its value for destructive purposes was incontestable, but it was thought to be necessary, in order to develop its full power, that the charge should be strongly confined.

The discovery with regard to its detonation when in a wet state has led to this material being used as the charge for torpedoes and submarine mines. The first pattern of Whitehead torpedo was 14 feet long and 16 inches in diameter; the speed of the torpedo was 9 knots for 200 yards, and the charge was 118 pounds of compressed, wet gun cotton. Several subsequent patterns of torpedoes have been introduced, the latest being 14 feet long and 14 inches in diameter, and by reducing the charge of gun cotton to 80 pounds, the high speed of 27 knots for 600 yards has been attained. The immense importance of this increased speed can be readily appreciated, as it enables a torpedo to strike the vessel at which it is discharged before she has time to get out of the way. The torpedoes are fired by a striker actuated by a spring which is released on the torpedo striking the side of the ship; the striker is pointed, and penetrates a cap charged with 38 grains of fulminate; the cap is embedded in an 8-ounce disc of dry gun cotton, enclosed in a hermetically-sealed case, and placed as nearly as possible in the center of the wet gun cotton charge containing 12 per cent. of water. Gun cotton is also used as the charge of submarine mines, the charge consisting of from 50 to 500 pounds of wet, compressed gun cotton.

There are various descriptions of marine mines, (1) ground mines: in these the charge is contained in a case of sheet steel, with cast-iron sinkers attached to it to keep it at the bottom of the harbor or river; these mines are fired electrically by observation from the shore when an enemy's ship passes over them. (2) Buoyant mines: these are anchored a few feet below the surface of the water by a steel rope attached to a sunken weight; they are connected with the shore by electric wires; a buoy with a signaling apparatus is attached to the mine, and when a ship strikes a buoy it rings a bell in the signaling-room on shore; if the ship is a friendly one it is allowed to pass, but if it is an enemy's ship the mine is fired by electricity and the ship blown up. (3) Electro-contact mines: these are used only in places where an enemy's ship would pass. When the mine is struck by a passing ship a steel spring or pendulum moves towards the point of impact and thus closes the circuit and fires the mine automatically.

The French, in 1887, were the first to adopt a smokeless powder for the cartridges for their new small-bore rifle, the Lebel. It is known as Vieille's powder, or "Poudre B;" its exact composition has been kept a secret, but it is believed that picric acid is mixed with the paste as described above. The ballistics attributed to this powder when first introduced were remarkable; a charge of about 70 grains imparted a muzzle velocity of 2,000 feet per second, to a bullet weighing 230 grains, fired from a rifle-barrel whose caliber was 315. But it was found that the powder rapidly deteriorated, and that these results were only attainable with recently manufactured powder, there being a notable falling off in velocity a few months after manufacture. In consequence of this it is stated that the French in 1889 abandoned the use of this powder, and reverted to the use of a good type of black powder until they can discover a more stable one.

The Germans also in 1889 introduced a smokeless

powder for their new small-bore rifle; it is a nitrated gun cotton, but although it was very highly spoken of after the autumn maneuvers of 1889, when it was extensively tried, it is believed that, like the French powder, it is still wanting in stability, and the Germans are already endeavoring to find a better description of powder.

Several patents for smokeless powder have been taken out in England, but none of them are entirely satisfactory, so that at the beginning of 1890 the subject was still under the consideration of the Explosives Committee, to whom it has been referred by the English government; and, although the difficulty of obtaining a smokeless powder of the necessary stability has not yet been surmounted, those who have the matter in hand are confident of being able to provide such a powder.

There can, therefore, be but little doubt that, as has already been mentioned, not only in England, but also on the continent of Europe, the use of smoke-

less powder, as a propelling agent in all military firearms, will be universal.

One of the most powerful explosives known is blasting gelatine, which is made by dissolving 7 per cent. of gun cotton in 93 per cent. of nitro-glycerin; it forms a gelatinous mass somewhat resembling honey in color, and varying in consistency from a tough leathery material to a soft substance, like stiff jelly. It is stronger than dynamite, as the nitro-cellulose itself is explosive, and if made with great care, and if absolutely free from all impurities, is a safe and stable explosive. But, unless the ingredients of which it is composed are absolutely pure and free from all foreign matter, it becomes exceedingly dangerous when stored in large quantities.

GUNNISON, the capital of Gunnison county, Col., situated on a river of the same name. It is a railroad junction, and is connected by branch roads with many mining points. Pop. (1890), 1,105.

GUNS AND GUNNERY. See Britannica, Vol. XI, pp. 297-315. In speaking of guns we understand the large pieces of ordnance called cannons. Modern guns and armored ships have been mostly developed during and since our late war. The 300-pounder rifled Parrot gun and the 450 pounder smooth-bore Rodman gun were produced during the war. The latter had a bore of 15 inches, was 16 feet long, and weighed 20 tons. In 1886 a gun weighing 115 tons was produced, which throws an elongated projectile of 2,300 pounds weight to a distance of nine miles. This was constructed by Alfred Krupp, in Essen, Prussia. He and Sir William Armstrong, of Newcastle, England, constructed most of the heavy ordnance now used in Europe. Guns weighing 120 tons, and one of the latest even 139 tons, were constructed at Krupp's works since 1886. The last-mentioned gun discharges a projectile of 2,314 pounds, which penetrates wrought-iron plates nearly 4 feet in thickness when fired by a charge of 1,069 pounds of prismatic powder. For a description of this powder and the mode of its manufacture, see Britannica, Vol. XI, p. 329. Still larger guns, capable of firing shells weighing over a ton, are projected by Krupp's successor.

The Krupp guns are now all "built up" by shrinking red-hot steel hoops over a central tube of crucible steel. There is a single layer of hoops around the tube for guns below 9-inch caliber; while the guns of 9-inch caliber and upwards have two layers of hoops protecting the after-parts. The tubes and hoops are forged without weld. The chambers of the guns are slightly larger than the bores. Their rifling consists in shallow grooves, widening a little toward the breech of the gun. Sir J. Whitworth's guns are made of tubes of fluid-compressed steel, over which massive steel hoops are forced either by hydraulic pressure or by shrinkage.

In Sir William Armstrong's system of gun making, wrought-iron coils are shrunk over a central tube and over one another, so that the central tube is strongly compressed and the outer coils in a state of tension. Wrought iron being twice as strong in the direction of the fiber as across it, the hoops made up of wrought iron bars welded together can resist great circumferential strains.

GATLING'S CAST-STEEL GUN.—Dr. Gatling has invented a new steel gun, which he claims will be far superior to the built-up gun, and can be made at

half the cost. The patents consist of making guns cast from the highest grade of steel to shape around a central core. This central core is utilized for the purpose of cooling the casting from the interior while the exterior is still hot. The cooling process thus begins from the interior and works out, directly the reverse of the ordinary way. The metal is forced, as it were, from the interior outwardly, thereby avoiding the creation of a hard, resisting arch on the exterior of the casting, at which point the full intensity of the high-power force exercised by the exploding ingredients within the gun exerts itself. It makes the interior of the gun, where the greatest strain is felt, the toughest and hardest part, and the soft and spongiest part the exterior, which thus acts somewhat after the manner of a cushion. This is directly the reverse of the old style guns, in which the spongiest part is on the interior. Another important point is the method in which the metal is cast. A revolving motion is given it, which makes the grain spiral.

With regard to "quick-firing guns," we insert the following article from "Engineering:"

QUICK-FIRING GUNS.—The application of the "quick-firing" principle to guns which may fairly be classed as armor-piercing will probably do more to govern the tactics of naval commanders in any war which may arise in the immediate—if not the distant—future than any other phase of production of warlike materiel. For service on shore it has been said that: "By the aid of quick-firing guns and the position-finder we are enabled to carry out the ideal system of defense; viz., few guns in dispersed emplacements concealed by natural features. The system has long been advocated by Sir Andrew Clarke, and it is difficult to see how any further opposition can consistently be offered to it."

For the protection of mine fields the quick-firing gun would be invaluable; indeed, the authority we have just quoted considers the operations of sweeping, creeping, or counter-mining might be rendered absolutely impossible by the fire of quick-firing guns. "The only reliable defense against an assailant's in-shore squadron," continues Captain Stone, "will be the extensive employment of quick-firing guns of sufficient caliber not merely to annihilate landing or boarding parties, or to send a torpedo boat *hors de combat*, and equal to the task of putting a gunboat *hors de combat*, and either wrecking her or making it possible for the active harbor defense to capture her."

The use of shells charged with explosives more powerful than gunpowder has given additional importance to these projectiles of smaller nature, and with the increased development of higher explosives a corresponding development of shell fire may be anticipated. This has already taken effect in the science of war-ship design and naval constructors are now looking with less favor on large unarmored surfaces; and indeed the older battle-ships with comparatively thin armor, which a year or so ago were considered all but obsolete, are now considered as of some importance in view of the development of quick-firing guns and high explosive shells.

The part which the Elswick firm has taken in the introduction of quick-firing guns is well known. We give two views

of a quick-firing gun, of which the following is a description:

This weapon is the 4.7 in. simultaneous loading breech-loading gun, caliber 4.724 in., or 12 cm., firing a shell of 45 lb., with 12 lb. of P. or S. powder. The gun is entirely of steel, its total length 16 ft. 2 in., length of bore, 40 caliber; and weight, 41 cwt.

The breech is closed on the interrupted screw system, and to render the closing and opening more easy and rapid, the breech block is formed in two steps, both of which have portions of an interrupted screw on their surfaces, the threads on one step standing longitudinally opposite to the blank spaces on the other. This is well shown in Fig. 12, the breech block being there swung back. The breech block swings rapidly into place, and is secured by a small turning movement. The gun is fired by electricity. In the base of the

cartridge case is screwed an electric primer, against which presses an insulated steel pin, carried in the axis of the breech block. This pin is in communication with the electric wires, which carry the current to fire the primer, only when the breech block is closed, and secured by turning the lever downward against the rear of the block. The circuit is closed and the charge fired by pulling the trigger of a pistol handle arranged in a convenient position close to the sights.

In case of the failure of the electrical firing gear, each gun is also fitted with a percussion lock; the electric primer in the base of the cartridge is replaced by a percussion primer of the same form, and the steel pin, which in the former case supplied the electrical contact, now serves as a firing needle. The percussion firing gear also has a safety appliance to prevent the charge being fired till the breech is

Fig. 11

Fig. 12

THE ARMSTRONG 4.7 INCH QUICK-FIRING GUNS.

closed and locked. In this manner all danger of accidental discharge is avoided, and complete security gained. The gun is mounted in a rocking slide, in which it can only move in the direction of recoil. Fixed to this rocking slide is a combined spring and hydraulic buffer arrangement, which serves both to check the recoil and also to run the gun out again after discharge. An arm projects downward from the breech of the gun, and is attached by a nut to the ram of the hydraulic recoil press. The gun itself has no trunnions, but slides in the rocking slide to the extent of the recoil, which is only 9 inches.

The action on firing is as follows: The gun slides back within the rocking slide, the recoil being transmitted by the

arm to the recoil press, where it is absorbed; the spring in the second cylinder is at the same time compressed.

As soon as the recoil is absorbed the spring begins to act, and pushes the gun back along the rocking slide to its first position. The lower part of the mounting is formed by a strong transverse steel plate or transom, which rigidly supports the mounting, and at the same time forms a substantial protection or shield to the base of the structure and the men working behind it. Above this is a lighter steel shield, covering the detachment from rifle fire, the upper portion being arranged to hinge back, so as to admit of a more extended view when using the gun at night.

The under carriage is carried on live rollers running on a

bed-plate, so as to insure great freedom of training, which is effected either by means of a shoulder-piece rigidly connected to the under carriage or by a worm-wheel training gear, worked by a hand-wheel at the sighting or firing position. A clamp on the bed-plate is provided, so as to fix the gun at any desired point of training. The elevation and depression of the gun require very little power, as the gun and working slides are accurately balanced on their trunnion bearings. The rack and pinion gear for this purpose is worked by an elevated hand-wheel close to the training-wheel, and thus also at the sighting or firing position.

This description applies equally to the quick-firing guns and mountings of the larger natures. On account, however, of the increased weight of the ammunition, the carriage and projectile are often handled separately.

The quick-firing gun is an extension, or, at any rate, the outcome of the smaller machine guns of the Hotchkiss, Nordenfiet, and Gardner type. The Hotchkiss are, however, now made up to 3.94 in. bore, and throw a projectile of 33 lb. This class of gun is useful against torpedo boats and unarmored structures, but could hardly be used with effect upon any protection which could be dignified with the name of armor.

The ideal gun has been described as that which possesses high penetrative power, and a capacity for firing shells with the most effective bursting charges, while it could, when required, be fired with great rapidity to repel a flotilla of attacking vessels.

These points are secured with the weapons we are now considering. With the 4.7 in., 5.5 in., and 6 in. guns the projectiles are 45 lb., 70 lb., and 100 lb., or even 120 lb. The rate of fire has been found in actual practice to be from six rounds per minute with the 6-in. gun to fourteen rounds per minute with the 4.7-in. gun. If we compare the rate of fire of these guns with that obtained from the ordinary breech-loading guns in the service, we find that some experiments carried out on shipboard by the admiralty gave ten rounds in 47 seconds from the 4.7-in. quick-firing gun, while the 5-in. ordinary breech-loader took 5 minutes 7 seconds to discharge the same number of rounds.

It is unnecessary to dwell on the advantages of rapidity of fire in action. It was this feature which contributed so much in times past to naval victories.

In this epoch of mechanism, however, we must depend on the brains of our inventors rather than the muscles and nerves of our seamen to give like results; although we by no means wish to say that the day for nerve and muscle is past. Indeed, the value of cool and disciplined courage was never more apparent in the past than it will be in the next great naval war.

Hardly any superiority in *personnel* could compensate for the disadvantage in *material* of a gun requiring over five minutes for what another, though we must have quick-firing guns in spite of minor objections that may be raised against them, such as difficulties on account of smoke—when smokeless powder is not used—or in getting the ammunition to the gun with sufficient rapidity.

Naval authorities have not been slow to acknowledge the advantages of the new principle, and large orders for the navy for 4.7-in. and 6-in. guns have been given to the Messrs. Armstrong, the results of which are very plainly visible just now in the Elswick shops.

We have already described the mechanism of this gun, but there are some points in the design put forward by the makers to which attention may be called. By the interrupted screw system of breech-closing two advantages are secured. First, the action of opening and closing the breech is much simplified, as the breech piece need not be withdrawn before hinging away; and, secondly, the coned shape of the breech screw enables it to take hold, not only of the inner surface of the metal of breech piece or jacket, but also distributes the engagement, and therefore the strain and support, throughout a considerable thickness of the gun.

The breech screw is further arranged so that the threads of the smaller end of the cone correspond longitudinally with the interrupted spaces of the larger end, and *vice versa*, so that the strain and support are also distributed throughout the entire circumference of the breech screw, instead of as formerly, half the circumference being lost by the interrupted spaces. In the mounting the labor of training and elevating is reduced to a minimum. A shoulder crutch and a pistol trigger is provided, and the piece can be handled by a single man with the same ease as the small Hotchkiss 6-pounder.

The recoil is so arranged that the man aiming can alter the position of the gun up to the very instant of firing, and also keep control of the gun working and sighting gear during the actual discharge, or throughout any number of rounds. Naval officers will not be slow to appreciate the advantage secured by this arrangement under the varying conditions of actions at sea.

The carriage allows the gun to recoil always in the line of fire, and the fixings and deck are thus to a large extent relieved of the ordinary recoil strains. After discharge the gun returns instantly and automatically to firing position. A substantial shield of steel, $\frac{3}{4}$ in. thick, is provided in front, and protection is thus given to the men serving the gun.

In the ammunition the principle of the ordinary rifle cartridges has been extended to these guns; the projectile and

powder charge forming only one piece. The powder is put into a solid-drawn brass cartridge, in the mouth of which the projectile is fixed, so that the whole can be handled together. A great saving of time and labor is thus effected, and the incidental advantages of increased safety and the immunity of the powder from climatic deterioration are also secured. To the fact of the projectile and charge being thus placed in the gun at the same time is due the title of "simultaneous loading" which has been applied to these guns. To the improvement in the ammunition the quick rate of firing is very largely to be attributed. The solid-drawn cartridge cases, owing to their great size, have presented difficulties of manufacture; but these have been now surmounted, and it is found in practice these can be fired as many as ten times over without need of re-forming.

In apportioning the ammunition for these guns, penetrating shell will constitute a very large proportion of the whole equipment.

Side by side with the improvement in the guns and mountings have gone new discoveries and developments of gun powder. That specially designed for use in these guns is practically smokeless—an inestimable advantage where rapid firing is an essential—and the hanging smoke which makes good aiming impossible is thus almost entirely avoided. The pressures obtained with it are very uniform, and the velocities very high, ranging up to 2,450 ft. or 2,500 ft. per second.

One of the principal reasons that led to so large an employment of quick-firing guns in naval services was the necessity of being able to cope instantly and effectually with the attack of torpedo boats. The very high rate of speed possessed by the modern torpedo boat, while increasing its powers of offense, has at the same time diminished the risk of its being hit. It not only remains a much shorter time exposed to fire when making its attack, but its rapid motion necessitates a great alteration of aim between each round fired at it, and a corresponding likelihood of error.

Suppose a torpedo boat to be sighted at a distance of 1,500 yards by a war vessel having a broadside armament of three service 5-in. breech-loading guns, each capable of firing two rounds a minute. It is estimated that the torpedo boat could not hope to discharge a torpedo with much certainty at a longer range than 200 yards; and would, therefore, have to traverse a distance of 1,300 yards under fire before she could begin the attack.

Assuming the speed of a first-class torpedo boat to be twenty knots an hour, which is certainly a high figure, the time occupied in traversing 1,300 yards would be, roughly speaking, two minutes. The war vessel, therefore, armed with a broadside of three 5-in. guns, each firing two rounds per minute, would be able to discharge twelve shots at the torpedo boat before there was a chance of her being torpedoed. If, however, in lieu of the three service 5-in. guns she was armed with three of the improved Armstrong 4.7-in. 45 pounders, she could in the same time fire no less than seventy-two shots, each gun being capable of firing twelve shots a minute.

Besides the advantage of being able to fire six times as often, there is the collateral one of a very slight alteration of aim being required in one case and a very considerable one in the other. Between the rounds of the 5-inch breech-loading gun, the torpedo boat would move 340 yards, and the aim would have to be correspondingly altered; while between the rounds of the 45-pounder gun she would only move thirty yards, and a very slight alteration would be required, and a successful shot could thus be instantly repeated.

But although it was the torpedo boat which first gave such an impetus to the introduction of the quick-firing gun, the weapon has been so largely developed in the progress of time that it now holds a much higher position, and cannot fail to play an important part in encounters between important war vessels in the future.

DYNAMITE GUNS.—Concerning the dynamite guns which form the equipment of the fast cruiser *Vesuvius*, we append the following remarks: An official test of these guns was made under the direction of Commodore Goodrich in November, 1889, and the commodore reported that the test was successful beyond anticipation. According to an account in the "Army and Navy Gazette," by one who has been present at the test, these trials have demonstrated that the *Vesuvius* can fire 30 shells—all she can carry—without stopping to fill the air reservoirs. The shells were about 7 feet long, and 10 inches in diameter, holding 200 pounds of explosive gelatine, and weighing respectively 483, 504 and 505 pounds. The performance of these guns as to range and rapidity of flight of the projectiles was nearly twice as great as was demanded by the contract.

The eye-witness concludes by saying, "A vessel that can deliver and explode three tons of high-class dynamite a distance of a mile with any ap-

proach to accuracy is a most formidable agent for attack and defense."

In February, 1893, a new departure was inaugurated by the trials of the Hurst gun, for the construction of which Congress had appropriated \$50,000. The government had also contracted with the inventor, Gen. H. P. Hurst, a Kentuckian, for the purchase of all rights to manufacture and use it in the United States, paying for it \$150,000. Gen. Joseph R. Hawley, of Connecticut, invented, in connection with the gun, a projectile, said to be unique in its efficiency, and has assigned it, free of cost, to the government. The gun is to use what is known as the Hurst reinforced or multicharge cartridge, firing about three times as much powder as is burned in any other gun of equal dimensions. The reinforced charge first burns a third of the powder, and just as the projectile is leaving the arm the remaining charge is exploded, which guarantees safety, insures the minimum recoil and secures the greatest possible velocity.

The velocity for the projectile is said to be of 2,800 feet per second, while the government's guns give the same projectile but 2,150 feet per second. It penetrates twenty-one inches of steel, while the government's guns have but sixteen inches of penetration. It will throw an immense projectile with accuracy from 14 to 18 miles. Ordnance officers declare it the most wonderful invention of the age.

GUNTHER, ALBERT CHARLES, was born at Esslingen (Württemberg), 1830, and educated at the universities of Tübingen, Berlin and Bonn; entered the service of the trustees of the British Museum in 1858, and was appointed keeper of the department of zoology in 1875. Since that time he has devoted himself exclusively to the administration of the extensive collections under his charge. Doctor Gunther is a member of several academies and learned societies at home and abroad. He has published many and valuable works on zoology.

GURNEY, JOSEPH JOHN, born in 1788, of a Quaker family; died in 1847. He devoted his life to the cause of philanthropy, and took a special interest in prison reform, the question so ably advocated by his sister, Mrs. Elizabeth Fry.

GUROWSKI, ADAM, COUNT, born at Kalisz, Poland, Sept. 10, 1805, died at Washington, D. C., May 4, 1866. Expelled from the gymnasium of Warsaw and Kalisz for participating in revolutionary demonstrations, he continued his studies at German Universities. In 1825 he returned to Warsaw, assisted to organize and took part in the unsuccessful revolution of 1830, and at its close escaped to France. In 1835 he published *La Vérité sur La Russie*, which was favorably received by the Russian government, and he was recalled and employed in the civil service. In 1844 he went to Heidelberg, and devoted himself to study; afterwards he lectured in the University of Berne, Switzerland, spent some time in Italy, and in 1849 came to the United States. He was translator in the State Department at Washington from 1861 to 1863. Among his works published in the United States are: *Russia as It Is* (1854); *The Turkish Question* (1854); *A Year of the War* (1855); *America and Europe* (1857); *Slavery in History* (1860); and *My Diary*, notes on the civil war (3 vols., 1862-66).

GUTHRIE, JAMES, born in Nelson county, Ky., Dec. 5, 1792, died in Louisville, March 13, 1869. He was educated at Bardstown, Ky., studied law, and in 1820 commenced practice in Louisville. He was a member of the State legislature from 1827 to 1840, and was president of the convention that framed the present constitution of the State; was secretary of the United States Treasury in 1853-57, and United States Senator in 1865-68.

GUTHRIE, SAMUEL, chemist and inventor, born at Brimfield, Mass., in 1782, died at Sackett's Harbor, N. Y. Oct. 19, 1848. He invented and first manufactured a lock which took the place of the old flint-lock in firearms, and was one of the original discoverers of chloroform. His process of producing chloroform, which he termed "spirituous solution of chloric ether," was tested by the elder Silliman at Yale College in 1831, and a committee of the Medico-chirurgical Society of Edinburgh awarded him the merit of having first published an account of its effects as a diffusible stimulant.

GUTTIFERÆ, or CLUSIACÆ, a natural order of exogenous plants, consisting of trees and shrubs, natives of tropical countries, generally secreting an acrid yellow resinous juice. A few are epiphytes. The leaves are opposite, destitute of stipules, leathery and entire. This order is allied to *Hypericinae*. It contains about 150 known species, the greater part of them South American. The resinous secretions of some are valuable, and a few species afford valuable timber. The flowers of some are very fragrant; those of *Messua ferrea* are found in a dried state in every bazaar in India, and used as a perfume. The fruit of some is very highly esteemed.

GUYOT, ARNOLD, geographer, born in Switzerland in 1807, died at Princeton, N. J., Feb. 8, 1884. He took the degree of Ph. D. at Berlin in 1835; was the colleague of Agassiz at Neuchâtel in 1839-48, and in the latter year accompanied him to America. He delivered a course of lectures at Lowell Institute, Cambridge, which were translated and published as *Earth and Man*, in 1853; in 1854 was appointed professor of physical geography and geology at Princeton, which position he occupied until his death, being for some time senior professor. He had the management of the meteorological department of the Smithsonian Institution, where he delivered several courses of lectures, and in connection with which he published *Meteorological and Physical Tables* (revised ed., 1884). His other works include: *A Treatise on Physical Geography* (1873); *Creation, or the Biblical Cosmogony in the Light of Modern Science* (1884); and a number of valuable biographical memoirs.

GUYSBOROUGH, a seaport town, capital of Guysborough county, N. S., situated near the head of Chedabucto Bay, about 120 miles east-northeast of Halifax. It has a commodious harbor, and important industries of fishing and gold-mining. It is also the seat of a large academy.

GUY'S HOSPITAL, London, England, was founded by Thomas Guy (see *Britannica*, Vol. XI, p. 341), who leased from the governors of St. Thomas's hospital, a large piece of ground for a term of 999 years, at a ground-rent of £30 a year. The hospital admitted its first patient in 1725, a few days after the death of its founder. In 1829 Mr. Hunt bequeathed to the hospital £190,000, and additional bequests to the amount of £10,000 have since been received. There was at first room for about 400 patients; now 700 can be accommodated. The yearly average of patients is over 5,000; the out-patients relieved may amount to above 80,000. The annual income is about £40,000. Students enter the hospital for study, attending clinical practice, lectures, etc., and paying annual fees. A library and valuable museums are attached to the hospital. New wards, with tall towers for ventilation, were built in 1852, and a chemical laboratory in 1872. A dental school for complete instruction in dental surgery and mechanics and a residential college for the accommodation of fifty students and the junior medical staff have recently been added. In the chapel is a fine marble statue of Guy, by Bacon,

which cost \$5,000. Sir Astley Cooper, the eminent surgeon, is buried in the chapel.

GUZMAN-BLANCO, ANTONIO, born in Caracas in 1830, was banished for his share in political disturbances, and, after taking a prominent part in two invasions, became vice-president of Venezuela in 1863. Driven from office in 1868, he headed a revolution which restored him to power in 1870, and for many years he was virtual dictator of the country, though not continuously occupying the position of president. In 1889, however, popular discontent was aggravated by reports of corrupt contracts made in Paris; and Blanco, who was then acting as envoy to all the European powers, was practically deposed by Congress, which refused to accept the resignation of his former *protégé* and present rival, Dr. Rojas Paul.

GWIN, WILLIAM MCKENDREE, born in Sumner county, Tenn., Oct. 9, 1805, died in New York City, Sept. 3, 1885. He received a classical education, took his degree of M. D. in 1828 at Transylvania University, and removing to Clinton, Miss., obtained an extensive practice. He was appointed United States Marshal for the district of Mississippi in 1833, and in 1840 he was elected to Congress as a Democrat. In 1849 he removed to California, where he took an active part in favor of the formation of a State government. He was elected United States Senator for the long term; was reelected, and served till March 3, 1861. In 1863 he went to Paris, and becoming interested in a scheme to colonize Sonora, Mexico, with Southerners, spent the two following years in an unsuccessful attempt to carry out his plan. He afterwards returned to his home in California, and continued to take an active part in politics.

GWINNETT, BUTTON, born in England about 1732, died in Georgia, May 27, 1777. He received a good education, was for a time engaged in mercantile pursuits in Bristol, England; emigrated to Charleston, S. C., and in 1770 purchased a plantation on St. Catherine's Island, Ga., and engaged in agriculture. He took an active part in the political questions of 1776, was elected a representative to the General Congress in 1776, and signed the Declaration of Independence. He was reelected for the ensuing year, was appointed a member of the State government, and president of the provincial council. His death resulted from a duel with Gen. McIntosh, fought May 15, 1777.

GYMNASTICS, a term applied to those exercises not amounting in intricacy to games, by which particular limbs, either singly or in combination, are rendered more pliant or stronger. These exercises are arranged in a due progression, and the entire series becomes a system under the name gymnastics. Gymnasias now exist in most European countries, and are popular in the Northern United States.

Gymnastic exercises may be divided into two great groups, those conducted without and those conducted with apparatus, while the latter group may be again subdivided into those requiring movable apparatus and those requiring immovable apparatus—*i. e.*, so far as the gymnast is concerned.

Exercises without apparatus have been specially studied in Sweden, and there chiefly by Professor Ling. By various movements of the arms, trunk, and lower limbs, singly or combined, every muscle

in the body can be brought into play, and all that is required for keeping the body in health can thus easily be practiced. In schools these movements have often been carried out with great advantage between lessons, giving the children that exercise which their growing frames demand, and thus avoiding restlessness, which is the natural result of enforced quiet. When a number of children work together, and especially when in time to music, the interest of the practice is greatly increased.

Next in simplicity are gymnastic exercises with movable apparatus—*i. e.*, such as weights and bars. Of these, the commonest forms are dumb-bells, barbells and Indian clubs. The arms and shoulders can be made to do any amount of work with these, according to the weights employed, and, if so desired, many of the exercises of the first group designed for the trunk and lower limbs may be carried out while dumb-bells or bar-bells are held in the hands, thus materially increasing the work done.

The forms of apparatus required for the last group of exercises are numerous, but only a few are really essential. Thus we have any number and variety of exercises that only require the horizontal and parallel bars, though in most gymnasia there are, besides, iron rings hung by ropes from the roof, a trapeze-bar also hung from the roof, ladders horizontal at some distance above the floor and vertical, climbing poles and ropes, and various pulleys with weights attached for exercising the wrists and shoulders.

GYMNOCLADUS, a genus of trees of the natural order *Leguminosæ*, sub-order *Cæsalpinieæ*. *G. Canadensis* is a North American tree, found both in Canada and over a great part of the United States, attaining a length of fifty to sixty feet, with upright branches and a rough bark. The leaves of young trees are very large, three feet long, bipinnate, and armed with thorns. The flowers are white, in short spikes, the pods five inches long by two broad. It is sometimes called the *Kentucky Coffee-tree*, because the seeds were formerly roasted and ground as coffee in Kentucky. It grows well in Britain. The wood is used both by cabinet-makers and by carpenters. It has very little sap-wood. The pods, preserved like those of the tamarind, are said to be wholesome and slightly aperient.

GYMNODONTES, a group of plectognath fishes, distinguished by having teeth united into an ivory-like substance resembling a beak. The different species are eccentric in form; most of them can distend themselves into a more or less globular shape. Some are covered with spines or prickles, and in others the body is truncated behind. The group contains several families, as *Tetrodontideæ*, *Diodontideæ*, *Molidæ*, etc.

GYMNOGENS, Lindley's term, now obsolete, for the Gymnosperms.

GYPSUM. See Britannica, Vol. XI, p. 351.

GYPSY-WORT (*Lycopus Europæus*), sometimes also called water horehound, a perennial plant of the natural order *Labiataæ*. It is a tall erect branching plant, slightly hairy, with a creeping root-stock. It is found in Britain, on the Continent, in Russian and Central Asia, and North America, and is regarded as a febrifuge and stringent. It dyes a permanent black. The bugle-weed of North America (*L. virginicus*) has more powerfully astringent properties.

H

HABBERTON—HÆMATEMESIS

HABBERTON, JOHN, was born in Brooklyn in 1842. From 1859 until he entered the army in 1862 he was connected with the publishing house of Harper Brothers. He was literary editor of the *Christian Union* from 1873 to 1876, and since then has been an editorial writer on the *New York Herald*. His first literary work was a series of sketches of Western life. This was followed by a volume of *Selections from the Spectator*, 1876, and in the same year appeared *Helen's Babies*, of which nearly a quarter of a million copies have been sold in the United States. He has since written *The Barton Experiment*, 1876; *The Jericho Road*, 1877; *Other People's Children*, 1877; *The Scripture Club of Valley Rest*, 1877; *Some Folks*, 1877; *The Crew of the Sam Weller*, 1878; *Little Guzzy*, 1878; *The Worst Boy in Town*, 1879; *Just One Day*, 1880; *Who Was Paul Grayson?* 1880; *Bowsham Puzzle*, 1884; *George Washington*, 1884; and *Couldn't Say No*, 1890.

HACKENSACK, a railroad center and the county-seat of Bergen county, N. J., located on the Hackensack River, 13 miles from New York. It has numerous factories. Pop. (1890), 6,004.

HACKETT, HORATIO BALCH, born in Salisbury, Mass., December 27, 1808; graduated at Amherst in 1830, and studied in Germany. He became a tutor at Amherst, professor of ancient languages at Brown University, and in 1839 professor of Biblical literature in Newton Theological Institute, which last position he held until 1869. In 1870 he became professor of Greek in Rochester Theological Seminary, and died November 2, 1875. He was one of the American revisers of the Bible, and was the author of many important works.

HACKETTSTOWN, a railroad junction of Warren county, N. J., situated on the Musconetcong River. It contains the Newark M. E. Conference Seminary, a car manufactory, foundries and several carriage manufactories. Pop. (1890), 2,417.

HACKLÄNDER, FRIEDRICH WILHELM, VON, German novelist and comedy writer, born at Burtscheid, near Aix-la-Chapelle, Nov. 1, 1816, died at Munich, July 6, 1877. He commenced his literary career with the publication of *Bilder aus dem Soldatenleben* (1841), and three years later followed up his success with *Das Soldatenleben im Frieden* (9th ed., 1883). He accompanied Baron von Taubenheim on his travels to the East, and in 1843 was appointed private secretary to the crown-prince of Württemberg, with whom he traveled in the succeeding years. In March, 1849, he went to Italy, and was present with Radetzky's army during the campaign in Piedmont. From 1859 he lived chiefly in Stuttgart. The best of his longer novels are *Handel und Wandel* (1850); *Eugen Stillefried* (1852); and *Namenlose Geschichten* (1851). His best comedies are the *Geheimer Agent* (1850), which has been performed throughout Germany, and translated into several European languages.

HADDAM, one of the county-seats of Middlesex county, Conn., on the west bank of the Connecticut River. It has large granite quarries. Pop. (1890), 2,065.

HADDON HALL, an old English baronial mansion, the seat successively of Avenells, Vernons, and the Rutland family. It stands on a slope

overlooking the Wye in Derbyshire, 23 miles north-northwest of Derby. The styles of architecture range from Norman to the 16th century. Reference is made to it in Scott's *Peveril of the Peak*.

HADES, the Greek name for the under-world. See *Britannica*, Vols. VIII, p. 536; XX, p. 114; XIV, p. 646.

HADROSAURUS, the name given to a very large Dinosaurian of the cretaceous epoch, whose remains have been found in the United States.

HAECKEL, ERNST HEINRICH, a German naturalist, born at Potsdam, Feb. 16, 1834. He studied natural science and medicine at Würzburg, Berlin, and Vienna, and soon became distinguished for his enthusiasm and originality in zoological studies. After working for a time at Naples and Messina, he became a privatdocent in the University of Jena in 1861, a professor *extraordinarius* in 1862, and an ordinary professor of zoology in 1865. In this position he has remained, working indefatigably in his zoological institute, and by his lectures rendering the University a very famous school for biological science. Haeckel has devoted his life to applying the doctrine of evolution, and has brought forward many interesting facts in support of the theory. The most important of his numerous systematic works are: *Die Radiolarien* (1862); *Die Kalkschwämme* (1872); *System der Medusen* (1879); and his contributions to the *Challenger Reports on Deep-Sea Medusæ* (1882); *Siphonophora* (1888); and *Radiolaria* (1887).

HAGEN, HERMANN AUGUST, born in Prussia, May 13, 1817; graduated at Königsburg, and practiced medicine. In 1867 he came to Cambridge, Mass., as assistant to Prof. Louis Agassiz, and in 1870 became professor of entomology at Harvard. He has written many articles on his favorite study, and is a fellow of the American Association for the Advancement of Science.

HÄHNEL, ERNST JULIUS, a German sculptor, born at Dresden in 1811. He studied architecture, but in 1830 he went to Munich and became a sculptor. Being recalled to his native city, in 1838, he made many sculptures for the new theater there. Among these are the statues of Sophocles, Aristophanes, Molière, and Shakespeare, and a bas-relief of Bacchus. Afterwards he prepared a statue of Beethoven, now in Bonn; a statue of Charles V., for the University in Prague; and for the new museum at Dresden he made six statues: Alexander the Great, Lysippus, Michel Angelo, Dante, Raphael, and Peter von Cornelius. After 1858 he made statues of the four Evangelists for the cathedral tower in Dresden; an equestrian statue of Prince Schwartzenberg for Vienna; a bronze statue of Leibnitz for Leipzig; and many other statues for his native city. Hähnel has been a member of the academy at Dresden since 1842, and a professor since 1848.

HÆMATEMESIS (Gr. *haima*, "blood," and *eme-sis*, "vomiting"), the ejection of blood from the stomach by vomiting. Its most common causes are gastric ulcer, congestion of the stomach or the neighboring portions of the alimentary canal, and certain conditions of the blood, as in yellow fever, purpura, and sometimes in typhus.

HÆMATOZOA (Gr. *haima* "blood," and *zōon*, an "animal"), parasites occurring in the blood. See PARASITISM, Britannica, Vol. XVIII, pp. 258-71.

HÆMODORACEÆ, an order of monocotyledons, consisting of herbaceous plants with fibrous roots and sword-shaped leaves, differing from *Iridacæ* in habit, and in having the stamens six in number, or, if only three, opposite to the petals. There are about 50 known species, chiefly natives of America, South Africa and Australia.

HAGARTY, HON. JOHN HAWKINS, D.C.L., chief justice of the supreme court of Ontario, was born at Dublin, 1816. He entered Trinity College in 1832, but two years afterward emigrated to Canada, where, in 1840, he was admitted to the bar. He was made a queen's counsel in 1850, and elevated to the bench in 1856. In 1868 he was appointed chief justice of the common pleas, and in 1878 received the appointment of chief justice of Ontario.

HAGEN, HERMANN AUGUST, a Prussian entomologist, born in 1817. In 1840 he received a medical degree from the University at Königsberg, and later studied in Paris, Berlin and Vienna. He devoted much attention to entomology, and in 1834 published a paper on *Prussian Odontata*. For some time from 1843 he practiced medicine at Königsberg, and for three years was the first assistant at the surgical hospital. From 1863 to 1867 he was vice-president of the city council. In 1870 he was made professor of entomology at Harvard University, Cambridge, Mass. He has written upwards of four hundred articles on scientific subjects.

HAGERSTOWN, a city and the county-seat of Washington county, Md. It lies in the fertile Cumberland valley, 86 miles west of Baltimore. It is the terminus of the Shenandoah Valley Railroad and of a branch of the Baltimore and Ohio system. The Cumberland Valley Railroad and the Western Maryland Railroad run through the town. Hagerstown has a fine court-house, a jail, and an academy of music; also a free library, public water works, banks, hotels, churches, seminaries and public schools. Several newspapers are published here. This town is a local center of high social refinement, the population being mostly of American birth, many of German descent. The chief manufactures are furniture, wheels, doors, sashes, castings, farm tools, brooms, cigars and fertilizers. Population in 1890, 11,698. See Britannica, Vol. XI, p. 370.

HAGGAI. See Britannica, Vol. XI, p. 870; Vol. XIII, p. 418.

HAGGARD, HENRY RIDER, English novelist, born at Bradenham Hall, Norfolk, June 22, 1856, and educated at Ipswich Grammar School. At the age of nineteen he accompanied Sir Henry Bulwer to Natal as his private secretary, and subsequently served in a similar capacity under Sir Theophilus Shepstone, commissioner to the Transvaal. On his return to England he settled down to a literary life. He published *Ceterways* and *His White Neighbors* (1882); *Dawn* (1884); and *The Witch's Head* (1885). The publication of *King Solomon's Mines* (1886) won for him great popularity, which was further increased by the appearance of *She* in 1887. *Jess*, *Allan Quartermain*, *Maiwa's Revenge*, *Mr. Meeson's Will*, *Cleopatra*, *Allan's Wife*, and *Eric Brighteyes*, are among Mr. Haggard's recent writings.

HAGUE, ARNOLD, geologist, was born in Boston, 1840; graduated at the scientific school of Yale in 1863, and for several years studied at Göttingen, Heidelberg, and Freiberg. In 1867 he was appointed assistant on the United States geological exploration, under Clarence King. From 1867 to 1868 he was in California. He contributed a number of

papers to the United States Government reports. In 1877 he became government geologist of Guatemala. In 1878 the Chinese government employed him to examine the mines in northern China. In 1879 he returned to the United States and became one of the geologists of the government survey. In 1883 he became geologist of the Yellowstone Park division.

HAIMURA (*Erythrinus macrodon*), a large freshwater fish of Guiana. It measures from $3\frac{1}{2}$ to 4 feet in length; its flesh is well flavored, and at times it forms the principal article of food with the Indians. It is very voracious. The jaws are powerful, and the teeth are large and can inflict serious wounds.

HAIR GRASS (*Aira*), a genus of grasses having delicately paniced inflorescences, bearing spikelets with two unequal glumes and two perfect flowers, each with two thin membranous bracts, of which the outer is generally awned. The species are natives of temperate and cold climates. Five species are natives of Britain, and are chiefly found in situations where the soil is unfertile. The tufted hair-grass, or tufted grass (*A. caespitosa*), common in better pastures and meadows, is a beautiful grass when in flower. It attains a height of 2 to 4 feet, and is sometimes used for thatching ricks of hay or corn. It grows luxuriantly in moist situations, and indicates a badly drained soil. This grass is sometimes sown to form cover for game, particularly hares.

HAIR-POWDER, a pure white powder made from pulverized starch, scented with violet or some other perfume, and in the 17th and 18th centuries largely used in England for powdering over the head. The fashion became universal among the higher and middle classes, with ladies as well as gentlemen. To make the powder hold, the hair was usually greased with pomade, and accordingly the fashion was extremely troublesome. An act of Parliament fixed that the powder should be made from starch alone, and on November 20, 1746, fifty-one barbers were fined £20 each for keeping hair-powder not made from starch. In 1795 a tax was put on hair-powder, and it was not repealed until 1869. At the time of its abolition it was paid by about 800 persons, and yielded a revenue of about £1,000 a year.

HAIR-TAIL, a long thin sea-fish. See Britannica, Vol. XI, p. 877.

HALDEMAN, SAMUEL STEHMAN (1812-80), an American naturalist. From 1837 to 1842 he was engaged on the Pennsylvania geological survey, and during that time prepared five annual reports. In 1842-43 he was engaged in delivering lectures on zoölogy at the Franklin Institute in Philadelphia, and in 1851 was made professor of natural sciences in the University of Pennsylvania. In 1855 he became professor in Delaware College. From 1869 to his death he was professor of comparative philology in the University of Pennsylvania. Besides many articles on philology, conchology, entomology, geology, chemistry, and palæontology, he published *Fresh-Water Univalve Mollusca of the United States* (1840); *Zoölogical Contributions* (1842); *Elements of Latin Pronunciation* (1851); *Tours of a Chess Knight* (1865); *Afices in their Origin and Application* (1865); *Rhymes of the Poets* (1868); *Pennsylvania Dutch* (1872); *Outlines of Etymology* (1877); and *Word-Building* (1881).

HALE, BENJAMIN (1797-1863), an American educator. In 1822 he was licensed to preach as a Congregationalist, and in 1823 became tutor in Bowdoin, but subsequently became principal of the Gardiner Lyceum. From 1827 to 1835 he was professor of chemistry and mineralogy at Dartmouth:

from 1836 to 1858 he was president of Hobart College, Geneva, N. Y., resigning in the latter year on account of feeble health. He wrote *Introduction to the Mechanical Principles of Carpentry* (1827); and *Scriptural Illustrations of the Liturgy* (1835).

HALE, EDWARD EVERETT, an American author and Unitarian divine, born in 1822. He was licensed to preach in 1842; from 1846 to 1856 was pastor of the Church of the Unity in Worcester, Mass., whence he was called to the South Congregational (Unitarian) church in Boston. He has been a constant contributor to periodical literature, and has edited the Boston "Daily Advertiser," the "Sunday-School Gazette," the "Christian Advertiser," the "Old and New," and the "Lend a Hand;" a *Record of Progress and Journal of Organized Charity*. Besides numerous other writings he has published *The Rosary* (1848); *Margaret Percival in America* (1850); *Sketches of Christian History* (1850); *Letters on Irish Emigration* (1852); *If, Yes, and Perhaps* (1868); *Ten Times One is Ten* (1870); *Our New Crusade* (1875); and *The Kingdom of God* (1880).

HALE, EUGENE, a United States Senator, born in 1836. He was admitted to the bar in 1857; was for nine successive years county attorney for Hancock county, Maine; was a member of the State legislature in 1867, 1868 and 1880; and was a member of the 41st, 42d, 43d, 44th and 45th Congresses. He was elected to the United States Senate as a Republican; took his seat March 4, 1881, and was reelected in 1887 and 1893. His term of service will expire March 3, 1899.

HALE, JOHN PARKER (1806-73), an American statesman. He was admitted to the bar in 1830, and in 1832 was elected to the New Hampshire legislature. From 1834 to 1841 he was United States district attorney, and from 1843 to 1845 was a member of Congress. In 1847 and again in 1855 he was United States Senator, and in 1865 was minister to Spain. In 1852 he was the Free-soil party's candidate for President, and received 157,685 votes.

HALE, NATHAN (1755-76), an American soldier. He graduated at Yale in 1773, and then taught school in East Haddam, and later in New London, Conn. At the beginning of the Revolutionary war he enlisted as a volunteer, and became a lieutenant in Col. Charles Webb's regiment. In January, 1776, he was made a captain, and a little later held a similar post in a company in the "Connecticut Rangers." On Gen. Washington's call for a volunteer to enter the British lines and procure intelligence Capt. Hale responded, and disguised as a schoolmaster and loyalist, he visited all the British camps in New York and on Long Island. He obtained the needed information, but when about to return he was arrested and condemned to be executed before sunrise on the next morning. The execution took place in Col. Henry Rutgers' orchard, near the junction of East Broadway and Market Street, New York city. Capt. Hale's last words were: "I only regret that I have but one life to lose for my country."

HALE, NATHAN (1784-1863), an American journalist. He was admitted to the Connecticut bar in 1810, and in 1814 became an editor of the "Boston Weekly Messenger." The same year he purchased the "Boston Daily Advertiser," and continued as its chief editor until his death. He was a founder of the "North American Review" in 1815, and of the "Christian Examiner" in 1828, and in 1840 he edited and published the "Monthly Chronicle." For nineteen years he was president of the Boston and Worcester Railroad, and in 1846 was chairman of the commission for introducing water into the city. He was at various times

a member of the legislature, and held important offices in various literary organizations. He published *Journal of Debates and Proceedings in the Massachusetts Constitutional Convention* (1821), besides numerous pamphlets on public improvements.

HALE, SARAH JOSEPHA (BUELL) (1788-1879), an American authoress. From 1823 to 1837 she edited the Boston "Ladies' Magazine," and when this periodical was united with "Godey's Lady's Book," published in Philadelphia, she became editor of this magazine. In 1877 she retired from editorial work. Mrs. Hale was the author of *Woman's Record, or Sketches of All Distinguished Women from the Creation to the Present Day* (1853); *Northwood* (1827); *Sketches of American Character* (1830), and a number of other useful and entertaining works in prose and verse. Among her fugitive pieces *Mary's Lamb* is one of the most widely known. Her exertions in behalf of the Bunker Hill Monument Fund, her interest in seamen, in foreign missions, and in the higher education of women were untiring and effective. For more than twenty years she advocated the keeping of Thanksgiving Day as a national festival, to be held on the same day throughout the country, as it has been observed since 1864.

HALES, JOHN, M. A., "the Ever-memorable," English divine and critic, born at Bath, April 19, 1584, died at Eton, May 19, 1656. At the age of thirteen he entered Corpus Christi College, Oxford, obtained a fellowship at Merton College in 1605, and in 1612 became professor of Greek in his University. In 1618 he went to the Hague as chaplain to the ambassador, Sir Dudley Carleton, for whom he made a report of the proceedings at the famous Synod of Dort. He was there converted to Arminianism, and was subsequently appointed to a canonry at Windsor. The Puritan supremacy deprived him of this office and reduced him to poverty. Hales was one of the oldest of what is now called the Broad Church school—a rare example of a profound student without pedantry, a ripe theologian with an altogether untheological clearness of mind and directness of phrase. His writings were collected and published as the *Golden Remains of the Ever-memorable Mr. John Hales, of Eton College* (1659).

HALEVY, JOSEPH, a French orientalist, born at Adrianople, Turkey, in 1827. He studied the Semitic languages, and afterwards taught Hebrew in Adrianople and Bucharest. He became widely known through his Hebrew poems. The *Alliance Israélite Universelle* commissioned him in 1868 to examine the condition of the Fallashas of Abyssinia, which he did. His report attracted much attention. In 1869 the French government sent him to the southwestern part of Arabia, called Yemen (Arabia Felix of the Romans), to explore it archaeologically. Here he deciphered 68 inscriptions. He has published several volumes on oriental antiquities and epigraphy.

HALEVY, LÉON, a French poet and dramatist of Jewish extraction, born at Paris, in 1802, died at St. Germain-en-Laye, Sept. 3, 1883. He was educated at the Charlemagne Lyceum, where he became a proficient Greek scholar. Afterward he was a follower of Saint-Simon; assisted the latter in founding "Le Producteur;" issued the *Poésies Européennes*; wrote a *Résumé de l'Histoire des Juifs*; and in 1838 the *Histoire Résumée de la Littérature Française*. From 1838 to 1853 he was employed in the bureau of historic monuments in the department of public instruction. In 1855 he published the *Fables Nouvelles*, and in 1861 finished *La Grèce Tragique*. Besides, he published numerous poems, novels, tales, and translations from ancient and modern languages. His dramatic works cover a wide field. They in-

clude the tragedies *Le Czar Demetrius*, and *Electra*, the comedy *Le Duel*, and many dramas.

HALÉVY, LUDOVIC, born at Paris, Jan. 1, 1834, and in 1861 became secretary to the Corps Législatif. He first became known as the writer of the librettos to Offenbach's burlesques: *Orphée aux Enfers* (1861); *La Belle Hélène* (1865); *La Vie Parisienne* (1866); *La Grande-duchesse de Gérolstein* (1867); *Les Brigands* (1870). He wrote, besides, a large number of vaudevilles and comedies, among them *La Pêchole* (1868); *Frou-frou* (1869); *Tricouche et Cacolet* (1872); *La Petite Mère* (1880). His *Madame et Monsieur Cardinal* (1873) and *Les Petits Cardinals* (1880) are humorous sketches of Parisian theatrical life. In 1882 he published the charming idyllic story, *L'Abbe Constantine*, which was followed by *Criquette* and *Deux Mariages* in 1883. Halévy was admitted to the Academy in 1886. In many of his plays he had the collaboration of H. Meilhac.

HALF-BLOOD, related through one parent only. When two persons have the same father, but not the same mother, they are called brothers or sisters consanguinean; when they have the same mother only, they are called brothers and sisters uterine.

HALFORD, SIR HENRY, an English physician, born at Leicester, Oct. 2, 1766, died in London, March 9, 1844. He was educated at Rugby and Oxford, took his degree of M. D. in 1791, and three years later settled in London, where he became very popular. He was made a baronet in 1809, and was court-physician throughout the greater part of his career. Author of *Essays and Orations* (1831); *The Death of Some Eminent Persons* (1835); and *Nugæ Metricæ* (1842).

HALF-PAY, an allowance given in the British army and navy to commissioned officers who are not actively employed, and corresponds to the French *demi-soldé*. In the navy officers are appointed to a ship to serve for the period during which she is in commission. At the end of that period, or if promoted or otherwise removed from her, they are placed on half-pay until again called upon to serve. In the army permanent half-pay, first granted in 1698, was abolished in 1884, retired pay being substituted for it. Under the provisions of the royal warrant of 1887 lieutenant-colonels who have held command for four years are placed on temporary half-pay (11 s. a day) until promoted. Majors of seven years' regimental or five years' staff service in that rank may claim promotion to half-pay lieutenant-colonels; and these or any officers of lower rank may be placed on the half-pay of their rank while incapacitated through illness, or as a punishment for inefficiency. Seconded officers are those who are extra-regimentally employed, but whose names remain on the rolls of their regiments, additional officers being appointed in their places. On the termination of such employment they are absorbed into the regiment as soon as vacancies occur in their proper rank. Officers on retired pay are liable to be called upon to serve in case of national peril or great emergency.

HALL, ASAPH, an American astronomer, born in 1829. From 1857 to 1862 he was assistant in the Observatory of Harvard University, and then became aid in the United States Naval Observatory in Washington. He has been connected with all the important astronomical expeditions sent out under the United States Government since 1863, and has won great distinction by his discovery of the moons of Mars, which he named Deimos and Phobos (Terror and Fear). Prof. Hall is a member of numerous scientific societies, both in this country and in Europe.

HALL, DARWIN S., an American Congressman, born in 1844. In 1866 he settled in Minnesota, and

in 1869 and 1871 was elected county auditor of Renville county. He edited the Renville "Times" for several years, and was clerk of the district court in 1873 and 1877. In 1876 he was elected to the legislature; was appointed register of the United States land office at Benson in 1878 and 1882, and was chosen to the State Senate in 1886 for a term of four years. He was elected to the 51st Congress as a Republican.

HALL, DOMINIC AUGUSTINE (1765-1820), an American jurist. He was district judge of Orleans Territory from 1809 to 1812, and, when Louisiana was admitted to the Union, became one of its United States judges. He remained in the United States court until his death.

HALL, JAMES, an American palæontologist, born in 1811. From 1832 to 1836 he was assistant professor of chemistry and natural sciences at the Rensselaer polytechnic institute, and then became professor of geology. In the same year he was appointed assistant geologist of the geological survey of New York, and in 1837 was made State geologist in charge of the fourth district. He made his full report on the survey in 1843, and was then placed in charge of the palæontological work. In 1855 he was State geologist of Iowa, and in 1857 of Wisconsin. In 1866 he was appointed director of the New York State museum, still retaining the office of State geologist. He has written numerous important reports on geological and palæontological subjects.

HALL, JOHN, an Irish-American Presbyterian clergyman, born in 1829. He was licensed to preach in 1849, and engaged in missionary labor in the west of Ireland. In 1852 he became pastor of the First Presbyterian church at Armagh, and in 1858 of St. Mary's, Dublin. In 1867 he visited the United States as a delegate from the general assembly of the Presbyterian church in Ireland to the Presbyterian churches in the United States, and the same year was summoned to take charge of the Fifth Avenue Presbyterian church in New York. For several years he was chancellor of the University of the City of New York, resigning in 1891 because of the pressure of other duties. He is the author of *Family Prayers for Four Weeks* (1868); *Papers for Home Reading* (1871); *Familiar Talk to Boys* (1873); *Questions of the Day* (1873); *Foundation Stone for Young Builders* (1880); and *A Christian Home; How to Make and How to Maintain It* (1883).

HALL, LYMAN (1725-90), a Signer of the Declaration of Independence. In 1752 he settled in Sunbury, Ga., and acquired a large medical practice. He was a member of Congress from 1775 to 1780, and governor of Georgia in 1783. He was a member of the pre-Revolutionary conventions held in Savannah in 1774 and 1775.

HALL, NEWMAN, an English clergyman, born in 1816. From 1842 to 1854 he was pastor of the Albion Congregational church in Hull, and then went to London to take charge of Surrey Chapel, Blackfriars' road. In 1867 and again in 1873 he visited the United States, lecturing in the principal cities. Dr. Hall's publications include: *The Christian Philosopher* (1849); *Italy, the Land of the Forum and the Vatican* (1853); *Lectures in America* (1868); *Sermons and History of Surrey Chapel* (1868); *From Liverpool to St. Louis* (1869); *Prayer, its Reasonableness and Efficacy* (1875); *The Lord's Prayer* (1883); and *Songs of Earth and Heaven* (1885).

HALL, SAMUEL CARTER, author and editor, born at Geneva Barracks, County Waterford, Ireland, May 9, 1800, died March 16, 1889. In 1822 he went to London, studied law, and became a reporter for the "New Times." In 1825 he established the "Amulet," which he edited for several years; afterwards succeeded the poet Campbell as editor of the

"New Monthly Magazine," and did other journalistic work before founding the "Art Journal," which he edited from 1839 till 1880. He was an industrious worker and skillful compiler, the joint works written and edited by Mr. and Mrs. S. C. Hall exceeding 500 volumes. Among these were: *Ireland* (1841-43); *The Book of Gems; British Ballads*, one of the fine-art books of the century; and *Baronial Halls*. In 1880 he received a civil-list pension of £150 a year.

HALL, S. C., MRS. (ANNA MARIA FIELDING,) an Irish author, born in Dublin Jan. 6, 1805, died Jan. 31, 1881. At fifteen years of age she went to London, where her education was completed, and in 1824 married Samuel Carter Hall, whom she assisted in many of his works. She established a reputation of her own by her *Sketches of Irish Character* (1828); *Uncle Horace* (1837); *Lights and Shadows of Irish Character* (1838); *Marian* (1839); *Midsummer Eve* (1843); *The Whiteboy* (1845); and numerous shorter stories. She also contributed to the "Art Journal" and other periodicals, edited the "St. James's Magazine" for a year, and wrote various books for the young. She assisted in the formation of the Governesses' Benevolent Institution, and the Nightingale fund, the latter resulting in the endowment of a training-school for nurses.

HALL, SIR JOHN B., K. C. M. G., a New Zealand statesman, a member of Parliament since 1856 and premier, 1878-82. He was a member of the Federal conference held in Melbourne, Australia, in Feb., 1880.

HALLAMSHIRE, an ancient manor of the West Riding of Yorkshire, with Sheffield for its capital. It now gives name to a parliamentary division.

HALLÉ, SIR CHARLES, pianist, born in 1819, near Elberfeld, Germany. He studied chiefly in Paris. The revolution of 1848 drove him to London, where he soon came prominently into notice. He subsequently settled in Manchester as a classical pianist. Hallé has edited *Classical Composers*, and has done much for the culture of a high description of music. He was knighted in 1888.

HALLIWELL-PHILLIPPS, JAMES ORCHARD, F. R. S., an English antiquary and philologist, born at Chelsea in 1820, died at Brighton, Jan. 3, 1889. He studied for a time at Cambridge, and in 1839 began his long career as editor and publisher of old English authors and manuscript texts. His earlier work embraced plays, ballads, popular rhymes and folklore, chap-books, and English dialects, but he gradually came to concentrate himself upon Shakespeare alone. In 1872 he succeeded to the property of Thomas Phillipp. This wealth he made use of in the accumulation of an unrivaled collection of Shakespearean books, manuscripts, and rarities of every kind, in the entertainment of scholarly visitors, and in gifts of valuable books to Edinburgh University, Stratford, and Birmingham.

HALPINE, CHARLES GRAHAM (Miles O'Reilly), was born in Ireland, 1829, and died in New York, 1868. He graduated at Trinity College, Dublin, in 1846; married young and engaged in journalism. In 1852 he came to New York. At the beginning of the civil war he enlisted in a New York regiment; was immediately promoted lieutenant, and afterward served on Hunter's staff with the rank of major. While acting in this capacity he wrote the series of articles purporting to be the production of one "Private O'Reilly." He served on General Halleck's staff, and with Hunter in the Shenandoah Valley, and received the brevet of brigadier-general of volunteers.

HALLOWELL, a city of Kennebec county, Me., on the west bank of Kennebec River, two miles

south of Augusta. Cotton goods, oil-cloth, carriages, soap and candles are manufactured, and in former times ship-building was carried on. Granite of a superior quality is quarried. Pop. (1890), 3,181.

HALSBURY, HARDINGE STANLEY GIFFARD, a criminal lawyer of England, born in 1825. He became a queen's counsel in 1865. As such he was engaged in most of the celebrated criminal trials of his time, including the Overend, Gurney and Tichborne cases. In 1875-80 he was solicitor-general. On the accession to office of the Salisbury government in 1885 he was made lord chancellor of England. This is a remarkable exception to the rule of the English bar—that no criminal practitioner ever reaches the woolsack.

HAMBURG, FREE CITY AND STATE OF, a republic, constituting a part of the German empire. For its history, government and earlier statistics, see *Britannica*, Vol. XI, pp. 404-50.

The State reported in the census of Dec. 1, 1885, area of 160 square miles, and a population of 518,620. Included in the census returns were two battalions of Prussian soldiers, forming the garrison of Hamburg. The State consists of three divisions, the population of each of which was as follows on Dec. 1, 1885: City of Hamburg, with suburb, 305,690 (estimate for 1888, 315,033); 15 rural districts (Vororte), 165,737 (estimate for 1888, 201,057); Cuxhaven, Ritzebüttel, etc., 47,193. In the four years from 1867 to 1871 the population of the State increased at the rate of 2.51 per cent. per annum; from 1871 to 1875 at the rate of 3.41; 1875-80 at 3.10, and in 1880-85 at 2.66 per cent. yearly. A large stream of emigration, chiefly to America, flows through Hamburg. Of the population in 1885, 252,853 were males and 265,767 females, *i. e.*, 105.1 females per 100 males. There were 13,563 foreigners resident in Hamburg in 1885; of these 3,060 were Austrians, 2,403 Swedish and Norwegians, 1,825 Danes, 1,735 British, 2,674 other Europeans, 1,531 non-Europeans, and 335 unclassified.

The jurisdiction of the Free Port was on Jan. 1, 1882, restricted to the city and port by the inclusion of the Lower Elbe in the Zollverein; and on Oct. 15, 1888, the whole of the city, except the actual port and the warehouses connected with it (population 152 in 1885), was incorporated in the Zollverein. The alterations in the port necessitated by this step have involved an expenditure of six millions sterling, to which the imperial government contributes two millions.

The following table shows the number of emigrants for 1885 to 1889, inclusive, via Hamburg:

Year.	From Hamburg itself.	Total.	Bound for the United States.
1885.....	1,368	69,408	63,966
1886.....	1,450	88,633	83,504
1887.....	1,632	71,007	66,545
1888.....	1,291	88,737	83,515
1889.....	1,393	74,843	68,481

Hamburg is the principal port of Germany. In 1889 the number of ships which entered the port was 8,079, with a tonnage of 4,819,892.

During 1892 Hamburg suffered terribly from an epidemic of Asiatic cholera introduced by emigrant Russian Jews.

HAMBURG, a village and railroad junction of Fremont county, Iowa, situated near the Missouri River, 12 miles from Nebraska City. It has flour mills and a foundry. Pop. (1890), 1,634.

HAMBURG, a post-borough of Berks county, Pa., at the foot of Blue Mountain and on the east bank

of the Schuylkill River. It has a rolling-mill, foundries, tanneries and steam mills, and several German weekly newspapers. Pop. (1890), 2,134.

HAMERTON, PHILIP GILBERT, an English author, born at Laneside, near Shaw, in Lancashire, Sept. 10, 1834. He began his career as an art-critic by contributing to the "Fine Arts Quarterly," the "Fortnightly," and the "Saturday Review." Since 1869 he has edited the "Portfolio," an art journal which gives special prominence to etchings. Author of *Isles of Loch Awe*, poems (1855); *A Painter's Camp in the Highlands* (1862); *Thoughts About Art* (1862); *Etching and Etchers* (1866); *Contemporary French Painters* (1867); *Wanderholme*, a novel (1869); *The Unknown River* (1870); *The Intellectual Life* (1873); *The Life of Turner* (1878); *The Graphic Arts* (1882); *Landscape* (1885); and *French and English* (1889).

HAMILTON, a city of Hancock county, Ill., opposite Keokuk, Iowa, on the Mississippi River, and at the foot of Des Moines Rapids. It is an excellent fruit region, has abundant water-power, and several manufactories. Pop. (1890), 1,301.

HAMILTON, a post-village of Caldwell county, Mo., 50 miles east of St. Joseph. It has machine shops, flouring-mills, and is a shipping point for grain, cattle, horses and hogs. Pop. (1890), 1,641.

HAMILTON, a city and capital of Butler county, Ohio, located on both sides of the Miami River. In 1890 more than 800 new houses were completed, with nearly as many more in process of construction. The city controls and operates its own gas and water works, and there is a private gas and electric company. Street cars traverse the principal streets. North of the city the river is turned from its channel into an immense reservoir, which feeds a system of hydraulics, and gives fine power to the factories. The city is connected by four railroads with all parts of the country. There are several national and other banks. The public schools are of a high order, and occupy fine buildings. There is a free library and charitable institutions, such as a children's home and the county infirmary. The county court-house, completed in 1890, is a noble edifice, which cost \$300,000. Greenwood cemetery, with its beautiful lake, is well situated. Safe and lock works, stove foundry, buggy factory, carriage factory, Corliss engine works, canning-factory, a hosiery mill, autographic register factory, shop for making laundry machinery, and many others have been established during the last year. The Niles tool shop is well equipped, and the Hamilton tile factory is on a large scale. There are woolen mills, flouring-mills and six paper mills. Population in 1880, 11,000; 1890, 17,519.

HAMILTON COLLEGE. See COLLEGES, in these Revisions and Additions.

HAMILTON, FRANK HASTINGS (1813-86), an American surgeon. He was licensed to practice medicine in 1833; was chosen professor of surgery in the Western College of Physicians and Surgeons, in Fairfield, N. Y., in 1839; and in 1840 was called to the Medical College in Geneva, N. Y. In 1846 he became professor of the Buffalo Medical College, and in 1859 was elected to fill the chair of principles and practice of surgery in the Long Island College hospital. From 1861 to 1863 he served as surgeon in the army, and attained the rank of lieutenant-colonel. From 1868 to 1875 he was professor of surgery in the Bellevue Hospital Medical College, and was surgeon to the hospital from 1863 to his death. Besides numerous contributions to medical journals, Dr. Hamilton wrote *Treatise on Strabismus* (1844); *Treatise on Fractures and Dislocations* (1860); *Practical Treatise on Military Surgery* (1861); and *The Principles and Practice of Surgery* (1872).

HAMILTON, JAMES (1786-1857), an American statesman. He was admitted to the bar; practiced in Charleston, S. C.; served in the war of 1812 as a major; and for several years was mayor of Charleston. He was several times a member of the legislature, and from 1822 to 1829 was a member of Congress. Subsequently he removed to Texas, and at the time of his death was a United States Senator-elect from that State.

HAMILTON, JAMES (1819-78), an American artist. He was born in Ireland, emigrated to Philadelphia, Pa., and in 1856 began furnishing illustrations for books. He illustrated Dr. Kane's *Arctic Explorations*, the *Arabian Nights*, the *Ancient Mariner*, and other popular works. Among his pictures are *Capture of the Serapis*, *Old Ironsides*, *Wrecked Hopes*, *Egyptian Sunset*, *Morning off Atlantic City*, and *Moonlight Scene Near Venice*.

HAMILTON, JOHN CHURCH (1792-1882), an American lawyer, son of Alexander Hamilton. He practiced law for a time in New York city, and in 1814 joined the United States Army, but resigned the same year. During his active service he was aide-camp to Gen. W. H. Harrison. He wrote *Memoirs of Alexander Hamilton*, and edited his father's *Works*.

HAMILTON, LORD GEORGE FRANCIS, an English statesman, born at Brighton in 1845. In 1868 and again in 1874, he was elected to Parliament; became under-secretary for India, and four years later succeeded Lord Sandon as vice-president of the committee of council on education. In 1885 Lord Salisbury nominated him first lord of the admiralty, which office he held also under Salisbury's recent administration. Lord George was made governor of Tasmania in January, 1887.

HAMILTON, SCHUYLER, an American soldier, son of John Church, born in 1822. He entered the United States Army in 1841; served on the plains; was assistant instructor at West Point; distinguished himself several times during the Mexican war, and from 1847 to 1854 was aid-de-camp to Gen. Winfield Scott. In 1861 he volunteered as a private in the 7th New York regiment; acted as military secretary to Gen. Scott; was commissioned brigadier-general of volunteers; participated in several important undertakings, and was made major-general in September, 1862. On account of feeble health he resigned in 1863. He published a *History of the National Flag of the United States* (1852).

HAMLEY, GENERAL SIR EDWARD BRUCE, K. C. B., K. C. M. G., M. P., born in 1824. He served throughout the Crimean war, and in the Egyptian campaign (1882); was commandant of the Staff College 1870-77, and has held other important positions. He has received the Crimean medal with four clasps, the Egyptian war medal, and eight other decorations. In 1854 he produced a charming tale called *Lady Lee's Widowhood*. His *Operations of War*, of which several editions have appeared, is a recognized text-book for military examinations. He has written several other books and pamphlets on various subjects. In 1890 *The War in the Crimea* appeared from his pen. He has represented Birkenhead in Parliament since 1885.

HAMLIN, HANNIBAL, an American statesman, born in 1809. He was admitted to the Maine bar in 1833, and from 1836 to 1840, and again in 1847, was a member of the legislature. In 1842 he was elected to Congress, and reelected in 1844. In 1848 he was elected United States Senator, but resigned in 1857 to be inaugurated governor. Less than a month later, however, he resigned the governorship to accept a full term in the United States Senate. He held this last position until 1861, when he

again resigned and became Vice-President with Mr. Lincoln. His term expired in 1865. Mr. Hamlin was United States Senator from Maine from 1875 to 1881. He died in 1891.

HAMLINE, LEONIDAS LENT (1797-1867), an American M. E. bishop. For several years he practiced law at the Ohio bar, and in 1828 was united with the M. E. church. Shortly afterward he was licensed to preach, and in 1834 was stationed at Wesley Chapel, Cincinnati. In 1836 he became assistant editor of the "Western Christian Advocate," and in 1841 became editor of the "Ladies' Repository." In 1844 he was elected bishop. He resigned the office in 1852, and, by his own request, was placed on the list of superannuated preachers of the Ohio Conference.

HAMMER-BEAM, a portion of an open timber roof, forming a truss at the foot of the rafter, which gives strength and elegance to the construction.

HAMMER-CLOTH, a cloth which covers the driver's seat in some carriages.

HAMMOND, a railroad center of Lake county Ind., 20 miles from Chicago. It has large steel works and an extensive slaughter-house.

HAMMOND, JAMES HENRY (1807-1864), a United States statesman. He was admitted to the bar in 1828, and in 1830 became editor of the "Southern Times," published at Columbia, S. C. In 1835-36 he was a member of Congress, and from 1842 to 1844 was governor of South Carolina. From 1857 to 1860 he was a United States Senator, retiring on the secession of South Carolina.

HAMMOND, SAMUEL (1757-1842), an American soldier. He served in the Indian wars of the American colonies, and in the Revolution was present at the battle of Stono Ferry, S. C., at the siege of Savannah, at Blackstocks, at the siege of Augusta, and at the battles of King's Mountain, Cowpens and Eutaw. He was twice wounded, and attained the rank of colonel of cavalry. After the war he was appointed surveyor-general of Georgia, and from 1803 to 1805 was a Democrat in Congress. From 1805 to 1824 he was military and civil commandant of Upper Louisiana, and from 1831 to 1835 Secretary of State.

HAMMOND, WILLIAM ALEXANDER, an American physician, born in 1828. He entered the United States Army in 1849 as assistant surgeon, and in 1860 accepted a professorship of anatomy and physiology in the University of Maryland. At the beginning of the civil war he again entered the army, and in 1862 was appointed surgeon-general. In 1867 he became a professor in Bellevue Hospital Medical College, and then a member of the faculty of the University of the City of New York medical department. In 1882 he lectured on diseases of the nervous system in the New York Post-Graduate Medical School. Among his published works are *Physiological Memoirs* (1863); *A Treatise on Hygiene*, with special reference to the military service (1863); *Sleep and Its Derangements* (1869); *Diseases of the Nervous System* (1871); *Lal* (1884); *A Strong-Minded Woman* (1885); *On The Susquehanna* (1887).

HAMMONTON, a village of Atlantic county, N. J., on the Camden and Atlantic and the Philadelphia and Atlantic City railroads, half way between Philadelphia, Pa., and Atlantic City, N. J. Much fruit is grown here, and the village has manufactories of boots and shoes. Population (1890), 3,833.

HAMPDEN-SIDNEY COLLEGE. See COLLEGES, in these Revisions and Additions.

HAMPTON, a village of Franklin county, Iowa, situated on the Central Railroad of Iowa, 29 miles south of Mason City. It is the county-town, and contains a court-house, several churches, and a high school.

HAMPTON, the county-seat of Elizabeth City county, Va., two miles from Fortress Monroe. The principal trade is in oysters, fish, and garden produce. The village contains a famous normal and agricultural school, organized in 1868, for Indians and colored youth. A national cemetery is here, and an asylum for disabled soldiers. The small harbor opens into Hampton Roads. Pop. (1890), 2,513.

HAMPTON ROADS, the deep, broad channel opening from Chesapeake Bay into the James River. It was the scene of important operations during the civil war.

HAMPTON, WADE (1754-1835), an American soldier. He served with distinction in the Revolutionary war; was a member of Congress from 1795 to 1797 and from 1803 to 1805, and in the war of 1812 was a major-general. At the time of his death he was the wealthiest planter in the United States, and the owner of 3,000 slaves.

HAMPTON, WADE (1791-1858), an American soldier, son of the preceding. He was a lieutenant of dragoons in 1813, and acting inspector-general and aid-de-camp to Gen. Jackson at New Orleans in 1815. He succeeded to his father's estate.

HAMPTON, WADE, a United States Senator, born in 1818. He served in both branches of the South Carolina legislature; was a member of the Senate when the State seceded; was a member of the Confederate army during the war; was elected Governor of the State in 1876; and again in 1878, and was chosen to the United States Senate in December, 1878. He took his seat in 1879, and in 1884 was re-elected. His term of service expired March 3, 1891.

HANCHINOL (*Heimia salicifolia*), a Mexican plant of the natural order *Lythaceæ*, with lanceolate leaves, and flowers on one-flowered stalks. It is esteemed as a medicine.

HANCOCK, a village of Houghton county, Mich., situated on Portage Lake, opposite Houghton. It is connected with Lake Superior by a ship-canal, is a terminus of the Mineral Range railroad, and derives prosperity from its location in the copper region. The village contains several smelting-furnaces and stamping-mills. Pop. (1890), 1,172.

HANCOCK, WINFIELD SCOTT, was born in Montgomery county, Penn., February 14, 1824. He graduated at West Point in 1844, served with credit in Scott's campaign in Mexico, and on frontier duty until 1861, when he held the rank of captain. Having been appointed brigadier-general of volunteers in 1861, he served in the army of the Potomac throughout its existence. For distinguished service on the peninsula and at South Mountain and Antietam, he was given a division and the rank of major-general, and in 1863 he was placed in command of the second corps, for his services at Fredericksburg and Chancellorsville. His crowning glory was won at Gettysburg. Reynolds fell on the first day, and Hancock was sent forward by Meade to arrange the line until the commander could arrive. On the second and third days Hancock commanded the left center, on Cemetery Ridge, where, just in the moment of victory, he was severely wounded. He received the thanks of Congress, and returned to the command of his corps early in 1864, in time to take part in Grant's campaigns of that year. He distinguished himself again and again at the Wilderness, at Spottsylvania, and in the Cold Harbor and Petersburg operations. At the end of the war he commanded various departments, having been made a major-general in the regular army. From September, 1867, to March, 1868, he commanded the department of the Gulf, under the reconstruction acts; and certain orders issued by him, particularly those of November 29,

(1.) THE ATLANTIC SEABOARD.—Calais, Me., is the easternmost harbor of the United States. It is the center of a considerable lumber trade. At Calais's point, five miles from the town, there is a bar or ledge only eight feet deep at low water. There is no anchorage in the harbor. Eastport, Me., has a harbor free of ice in winter. There are two entrances to Rockland, Me., has an open harbor five fathoms deep within half a mile of the wharves, and three fathoms to the wharves. But it is often closed by ice in winter. Bangor Harbor, Me., is in Frenchman's Bay, and one of the best on the east coast. Penobscot Bay can carry six to fourteen fathoms up to the town of Bucksport, and there is a good anchorage but a very strong current. Bangor, at the head of this bay, has an extensive lumber and ice trade. The bay is closed by an extensive winter. Fort Knox, at the narrows of the Penobscot, defends the harbor. The harbor of Wiscasset, near Bath, Me., can hardly be surpassed by any. Its depth is six fathoms in the channel of the river. Bath has the largest ship-building and ship-owning interest in the State of Maine. It is 12 miles up the Kennebec River, which has so strong a

current that the ice can seldom close it up. The entrance of the river is defended by Fort Poplar, Portland, Me., on a peninsula of the Casco Bay, has a harbor which can carry five fathoms to within half a mile of the wharves and 16 feet up to the wharves. There are four entrances to the harbor, three of them rather crooked and shallow. Only the most southern entrance can be used by large vessels. The harbor is defended by Forts Gorges, Preble, Scammel, and a battery on Portland Head. Portland has a large foreign and coasting trade, and is the principal shipping port for Canada during the winter, as the harbor is always free of ice. Richmond Island harbor, near Portland, has a good anchorage of five fathoms' depth, and can easily be entered when vessels cannot get into Portland.

Portsmouth Harbor, N. H., has a good anchorage, and six fathoms can be carried up to the city. A U. S. navy-yard is opposite Portsmouth, distant half a mile. For vessels not going up to the city or navy-yard the usual anchorage is at Pepperell's Cove in from six to 11 fathoms. Portsmouth harbor is never closed by ice. It is defended by Forts Constitution, McClary and Sullivan, all in a dilapidated condition.

Newburyport Harbor, Mass., has a bar with only six feet of water at low tide, but this obstruction is being removed. Rockport harbor, Mass., on the northern shore of Cape Ann is 8 fathoms deep to the wharf. It is the best harbor of refuge in that neighborhood. In Massachusetts Bay, between the headlands of Cape Ann and Cape Cod, there are several important harbors, those of Gloucester, Salem, Boston, Plymouth and Provincetown. Gloucester harbor has a good anchorage in five fathoms within 600 yards of the shore, and in three and a half fathoms close to the shore. But it is frozen over in winter. The city of Gloucester has the largest fishing industry in the United States. Salem harbor can carry three and a half fathoms within half a mile of the town of Salem. The inner harbor is often closed by ice during January and February. Forts Lee, Pickering and Sewall defend this harbor. The city of Salem has a considerable coasting and ice trade. Boston harbor can carry 21 feet at any tide through the main channel. There are two other channels. It is defended by Forts Warren and Independence. The U. S. navy-yard is situated near Charlestown, opposite the city of Boston. A very extensive foreign and coastwise trade is carried on here, only second to that of New York. Plymouth harbor is often frozen over, especially the inner harbor. Only 21 feet can be carried into the outer harbor. Provincetown has one of the finest harbors on the Atlantic coast. It has plenty of water, good holding ground, and is easy of access. Except during severe winters this harbor is clear of ice. Sandwich harbor, in the southwestern part of Cape Cod Bay is the proposed terminus to the ship-canal from Cape Cod Bay, to the head of Buzzard's Bay; now it has a narrow and difficult entrance. New Bedford harbor can carry 16 feet into the inner harbor through a narrow, crooked channel. The outer harbor is an open roadstead with 4½ fathoms of water. There are forts at Clark's Point and Fort Point.

Newport, R. I., has a fine harbor with water enough for the largest ships; 19 feet can be carried into the inner harbor; Block Island Basin is an artificial harbor made by the United States Government for the shelter of small vessels. It is 7 feet deep and protected by a solid stone breakwater. The United States torpedo station is located at Newport harbor. Fort Adams and some earthworks on Dutch Island defend it. The town of Bristol, R. I., north of Newport, has a good anchorage in 5 fathoms of water, and off the lower end of the town the anchorage is 21 feet. Twenty-one feet can be carried through a dredged channel up to Providence. The nearest anchorage, in 5 fathoms, is four and a half miles distant from the city.

New London Harbor, Conn., is on Long Island Sound. It is formed by the lower portion of the Thames River and has a depth of 80 feet. Being three miles in length, it is one of the finest harbors in the United States. The entrance is defended by Forts Trumbull and Griswold. New Haven Harbor is only 12 feet deep near the city, and even this depth is only found in a narrow channel. But four miles south of New Haven the water becomes 5 fathoms deep. The harbor is defended by Fort Hale. Long Island Sound is very free from dangers throughout its length, and affords many anchoring places for light-draught coasters.

New York Harbor is one of the finest and most capacious harbors of the world. It is entered from Long Island Sound through the East River; the Upper New York Bay is entered from the ocean through the Narrows, between Staten Island and Long Island. The East River forms a large part of the water front of New York and Brooklyn, and for miles there are docks stretching along its shores. The East River channel was formerly obstructed by dangerous rocks and reefs at Hell Gate, both in mid-channel and projecting from the shores of small rocky islands; but these obstructions have been removed (see HELL GATE in these Revisions and Additions), and a large foreign trade now takes this route. Eight miles below the Upper Bay is Lower New York Bay. It is itself a harbor sufficiently large to accommodate all the fleets of the world. The Hudson or North River forms also a large part of New York's water-front. The defenses of the New York harbor are Fort Schuyler on Throgg's Neck, at the western entrance of Long Island Sound, and a fort on Willet's Point on the opposite shore; Forts Wadsworth and Tompkins at the Narrows, and several detached batteries on

the Staten Island shore; and Fort Hamilton and several batteries on the opposite Long Island shore. The forts in the bay are Fort Columbus, Castle William and some batteries all on Governor's Island, and Fort Gibson on Ellis Island.

Perth Amboy, N. J., has a harbor with 11 feet of water up to the town; mean rise and fall of tide, 5½ feet. It seldom freezes over. Steamers can generally force their way through the ice when any is formed.

The harbor of Wilmington, Del., has only 12 feet of water, while the Delaware River has 20 feet up to near the city of Wilmington.

Hampton Roads, Va., is a channel between Chesapeake Bay and the estuary of the James River, where the naval action between the *Monitor* and the Confederate iron-clad *Merrimac* took place in 1862. It is defended by Fortress Monroe. This channel affords an excellent rendezvous for a fleet. There is plenty of water for vessels of any draught from the entrance of Chesapeake Bay very near the fortress. Newport News is on the north, and Norfolk and Portsmouth are on the south side of this channel. The United States navy-yard is situated at Gosport, adjoining Portsmouth, and nearly opposite to Norfolk. Vessels drawing 21 feet of water can be carried to any of these cities. At Annapolis harbor, Va., vessels drawing 19½ feet of water can be carried over the bar. The United States Naval Academy is situated at Annapolis. To the city of Baltimore, Md., 24 feet can be carried through a dredged channel, and 19 feet can be carried to the city of Washington, which is 200 miles from the ocean.

Newberne, N. C., is at the head of Pamlico Sound. Ten feet can be carried to the town, but only 8 feet over the bar from the sea into the Sound. The same can be said about Plymouth, N. C., which is at the head of Albemarle Sound. These places ship lumber, tar, and turpentine. Wilmington, N. C., is 30 miles above the mouth of the Cape Fear River. Eight feet can be carried over the outer bar at the mouth of the river, and 7 feet in the river channel to the city. The town of Wilmington has a considerable trade in lumber, cotton, and turpentine.

Georgetown, S. C., is 14 miles from the bar at the entrance on Winyaw Bay. Seven and one-half feet can be carried to the town. Georgetown ships some lumber and turpentine. To Charleston harbor, S. C., 21 feet can be carried up the South Channel; but over the bar to the channel only 14 feet can be carried. Charleston has a large foreign trade, shipping quantities of cotton, phosphate, and Southern products. Port Royal, S. C., at the head of Port Royal Sound, has a fine harbor with 21 feet of water over the bar. Brunswick, S. C., has one of the best harbors on the coast, a deep arm of the sea, 20 miles long, leads to the town and approaches it by a channel 17 feet deep.

To Savannah, Ga., 9 feet can be carried, while 17 feet can be carried over the bar at the mouth of the river. The town ships large quantities of cotton, rice, lumber, and naval stores. St. Mary's, Ga., on St. Mary's River, has a good harbor. There are several anchorages inside the bar in from 4 to 7 fathoms of water. Seventeen feet can be carried to the town, 10 miles from the ocean.

To Jacksonville, on the St. John's River, nine feet of water can be carried over the bar through a narrow, crooked channel. It is 20 miles from the mouth of the river. The Florida harbors ship mostly lumber. St. Augustine has a shifting bar with 10 feet of water, inside of which there is a good harbor north of the town 18 to 20 feet deep.

(2.) THE GULF COAST.—Key West, southwest of the southern end of Florida, has a good anchorage for the largest vessels within a mile of the town. Three channels, the main ship channel, the southwest and the northwest channels, having from 12 to 30 feet of water, lead to this harbor. It is defended by Fort Taylor, some batteries, and two Martello towers. Key West ships mostly cigars and sponges. The Dry Tortugas, a group of ten low islets, west of Key West, form a large, deep and commodious harbor. It is of great strategic importance in the case of a war with a foreign naval power, because it will afford its possessor an excellent base for naval operations. This splendid harbor is defended by Fort Jefferson, on Garden Key. Tampa Bay, Fla., is an estuary from six to ten miles wide and extending northeast for 20 miles, where it forms two arms. It affords anchorage in five fathoms of water. Cedar Keys, Fla., has three channels leading to the town. Cedar Key is the deepest of these channels, with 15 feet of water up to its bar. Cedar Key is the terminus of the Florida Railroad. Apalachicola Bay is the seaport of Tallahassee. It is very shallow, and therefore seldom visited. To Apalachicola, at the mouth of the river of the same name, 15 feet can be carried over the bar at the entrance of the bay; but only four feet can be carried to the town. It is a shipping port for lumber. St. Joseph's Bay is a large, deep and commodious harbor just north of Cape San Blas. It can be entered in a gale or hurricane, and affords excellent anchorage. Pensacola Bay, Fla., is protected by Santa Rosa Island, and has an entrance 20 feet deep. It is defended by Forts Pickens, McRee, and Barrancas, besides a redoubt on the north side. The city of Pensacola is 10 miles from the entrance, and ships large quantities of lumber. The United States navy-yard is within three miles of the city.

Mobile Bay, Ala., is an estuary 35 miles long. The Mobile River, a large navigable stream, flows into this bay. The bay's entrance between Fort Morgan and Dauphin Island is nearly three miles wide. Eighteen feet can be carried through a dredged channel 21 miles long to the city of Mobile. This

harbor is the natural outlet of the greatest cotton region of the United States.

New Orleans, La., is 120 miles from the sea. The Mississippi River surrounds the city on three sides. Where the river flows into the Gulf of Mexico it spreads out into four prongs, called the Southwest, Southeast, Northeast, and South Passes. The famous jetties of Captain James B. Eads are at the entrance of the South Pass. It is 26 feet deep and 800 feet wide. The other three passes are only from 7 to 15 feet deep. The Mississippi delta and the neighboring waters are defended by the following works: Forts Pike, Macomb, Livingston, Jackson, and Philip, Tower Dupré, Battery Bienvenue, and the Tower at Proctorsville. New Orleans ships large quantities of cotton and sugar.

To Galveston harbor, Texas, 11 feet can be carried over the outer bar, and 9½ feet to the city wharfs. Appropriations have been made for deepening the entrance. It is defended at Fort Point and Bolivar Point. Galveston's trade is similar to that of New Orleans.

(3) THE PACIFIC COAST.—Port Townsend, Washington, on the Strait of Juan de Fuca, has a fine harbor, and five to nine fathoms can be carried within 400 yards of the town. Up to the wharfs of Seattle on Puget Sound five fathoms can be carried, and there is plenty of water at the anchorage off the town. Seattle has a large trade in lumber.

Astoria, Oregon, at the mouth of the Columbia River, has usually over 25 feet of water from the bar to the town. The depth of the bar varies.

Crescent City, Cal., has a very dangerous harbor with many shoals and rocks. San Francisco has one of the finest harbors in the world. Twenty-three feet can be carried over the bar to the city and in almost any part of the bay. It is connected with the ocean by a strait called the Golden Gate. The entrance of the harbor is defended by Fort Point, on the south shore of the Golden Gate, and another fort has been constructed on Alcatraz Island, two miles north of the city. Vallejo is situated 27 miles north of San Francisco Bay, on the opposite side of Napa Creek from the United States navy-yard. To the anchorage between the town and the navy yard 21 feet of water can be carried at low tide. Santa Cruz, Cal., has a well-protected harbor with good anchorage in water from 3½ to 15 fathoms deep. Santa Barbara, Cal., has a harbor open on the south side, but partially protected by an island. It is 19 feet deep at the wharfs. It exports much fruit and some wood. The harbor of San Diego is formed by a projecting point of land on the west side, which terminates at

the south end in Point Loma, and on the east side by a flat peninsula. The entrance to this fine harbor is over a bar with 21 feet of water.

(4.) For LAKE HARBORS, see NAVIGATION, INLAND, in these Revisions and Additions.

Docks are divided into wet docks, dry docks, and floating docks. For the description of the wet and dry docks, see Britannica, Vol. XI, p. 465.

"Floating sectional dry-docks" consist of several sections joined together by sliding beams. Each section consists of a large rectangular tank, at the sides of which are frames formed of four uprights. In each of these frames a float moves up and down in suitable gearings. It rises when a section is being lowered, and goes down when a tank is being raised.

In the "tubular floating-docks," both the bottom and vertical sides consist of large wrought-iron tubes. The bottom consists of eight such tubes running longitudinally; and the sides consist of many similar tubes fixed vertically inside of the two outer longitudinal tubes. The tubes are divided into many water-tight compartments, and have water-valves at the bottom. When the dock is to be sunk these valves are opened. When it is to be raised, compressed air is forced into the tubes, and the water is thus expelled through the valves. As soon as the dock and its vessel are fully raised the bottom valves are closed again.

By the "hydraulic lift-dock" the vessel is lifted bodily out of the water upon a raft-like pontoon, which has sufficient buoyancy to sustain the weight of the vessel. For this purpose the pontoon is brought up between two rows of columns extending down to the dock below. These columns carry hydraulic lifts. From the heads of these lifts some rods extend and are made fast to lattice girders reaching across to the opposite column. Upon these girders the pontoon rests. When the pontoon is raised the water is let out by valves in the bottoms of its tubes. As soon as the ship is lifted it may be floated away on its own pontoon; and the dock is left free to be used on another pontoon to raise a second ship.

A "balance floating-dock" consists of a large rectangular tank having hollow walls along its two long sides, but no walls at the ends. It is divided into a number of compartments. By pumping water into these side chambers any part of the dock may be lowered; and by forcing compressed air into them and the water out of them, they may be raised. Thus the dock can be balanced at any desired level.

DRY DOCKS IN THE UNITED STATES OF MORE THAN 58 FEET BREADTH:

HARCOURT, SIR WILLIAM VERNON, son of the late Rev. W. V. Harcourt, of Nuneham Park, Oxford, and grandson of a former archbishop of York, was born Oct. 14, 1827, and educated at Trinity College, Cambridge, where he graduated with high honors in 1851. Called to the bar in 1854, he was made queen's council in 1866, and in 1868 was returned to parliament for the city of Oxford as a Liberal. In 1873 he was appointed solicitor-general, and received the honor of knighthood. He held office until Mr. Gladstone's retirement in February, 1874, and when that statesman returned to power in 1880 he was appointed home secretary. Failing to secure reelection at Oxford, he was soon afterward returned from Derby, for which constituency he has continued to sit up to the present time. In 1886 he was appointed chancellor of the exchequer. Retiring the same year with Mr. Gladstone he again came into office with him in 1892 and was at once installed in the Exchequer as before.

HARDEE, WILLIAM JOSEPH (1818-73), an American soldier. He served in Florida for a time as first-lieutenant of 2d dragoons, and in 1844 was made captain. In 1847 he was promoted major for gallantry at the siege of Monterey, and at the close of the war was brevetted lieutenant-colonel. From 1856 to 1861 he was at West Point as commandant of cadets, and then joined the Confederate army with the rank of colonel. He served with distinction during the war, and attained the rank of lieutenant-general. At the close of the war he retired to his plantation in Alabama.

HARDIE, JAMES ALLEN (1823-76), an American soldier. He entered the artillery service in 1843; was an assistant professor in West Point in 1844, and served in garrison, frontier and Indian service till 1861. At the beginning of the civil war he was made lieutenant-colonel of the 5th artillery, and served through the war with distinction, attaining the brevet rank of major-general, United States Army. In 1866 he was senior member of a commission to inspect ordnance and ordnance stores in forts and arsenals.

HARDING, CHESTER (1792-1866), an American artist. He became a house-painter, and later devoted himself to portrait painting. He established himself in St. Louis, and in 1826 settled in Boston, where he became very popular. Among the distinguished persons who sat before him were James Monroe, James Madison, John Quincy Adams, Chas. Carroll, John Marshall, Wm. Wirt, Henry Clay, John C. Calhoun, Washington Allston, the dukes of Norfolk, Hamilton, and Sussex, Samuel Rogers, Sir Archibald Alison, Daniel Webster, and W. T. Sherman. He wrote *My Eglogistography*.

HARDING, SIR ROBERT PALMER, an English lawyer, born in 1821. He commenced his law practice in 1847, and has since taken part in many important liquidation cases, including the celebrated case of Overend, Gurney & Co., in which the liabilities amounted to nearly 20 million pounds sterling. In 1864 he was appointed a commissioner to inquire into the working of the Bankruptcy act; and in 1883 he reorganized this department on the basis of the Bankruptcy act of 1883. In January, 1890, he was knighted. At present he is a director in the Imperial British East Africa Co.

HARDWOOD TREES, forest trees, of comparatively slow growth, producing compact, hard timber, as oak, ash, elm, chestnut, walnut, beech, birch, etc. From these willows, elders, poplars, etc., are distinguished as *soft-wooded trees*. Neither term is of ordinary use extended to firs, pines, cedars or other coniferous trees.

HARDY, ARTHUR SHERBURNE, an American author, born in 1847. In 1869 he entered the United

States Army as second-lieutenant, but resigned the following year and became professor of civil engineering and applied mathematics in Iowa College, Grinnell. He then became professor in Chandler Scientific School of Dartmouth, and held this position until 1878, when he became professor of mathematics in the college proper. Prof. Hardy is the author of *Elements of Quaternions* (1881); *Imaginary Quantities* (1881); *New Methods in Topographical Surveying* (1844); a poem entitled *Francesca of Rimini*, and two novels, *But Yet a Woman* (1883); and *The Wind of Destiny* (1886).

HARDY, THOMAS, an English novelist, born in Dorsetshire June 2, 1840, commenced his career as an architect and prosecuted his studies in design at London, gaining such professional distinctions as the prize and medal of the Institute of British Architects, and Sir W. Tite's prize for architectural design, both in 1863. His first literary effort was a novel published in 1871, entitled *Desperate Remedies*. His next novels, *Under the Greenwood Tree* (1872), and *A Pair of Blue Eyes* (1873), prepared the way for his best work, *Far from the Madding Crowd*, which was published in the "Cornhill Magazine," in 1874. Other novels from his pen are: *The Return of the Native* (1878); *The Trumpet-Major* (1880); *A Laodicean* (1881); *Two on a Tower* (1886); *The Mayor of Casterbridge* (1886); and *The Woodlanders* (1887).

HARDY, SIR THOMAS DUFFUS, born in 1804 at Port Royal, Jamaica, died in London, June 15, 1878. At the age of fifteen he became a junior clerk in the Tower of London, was made deputy-keeper of the public records in 1861, and knighted in 1870. He won great distinction by his editions of ancient manuscripts. Among his important works were two folio volumes of the early *Close Rolls* (1833-44); one of the *Patent Rolls* (1835), and others of the *Norman Rolls and Charter Rolls*; *William of Malmesbury* (1840); a *Descriptive Catalogue of MSS.* relating to the history of Great Britain and Ireland (1862-71); and other works of much historical value.

HARE, a rodent mammal of the family *Leporidae*. See *Britannica*, Vol. XI, p. 476.

HARE, AUGUSTUS JOHN CUTHBERT, an English writer, born at Rome, Italy, in 1834. He received his education at Harrow and at the University College, Oxford. Afterwards he edited Murray's *Hand-books* for some English counties. His most interesting books are: *Walks in Rome*; *Days Near Rome*; *Wanderings in Spain*; and *Walks in London*. His *Memorials of a Quiet Life* contains charming biographies of various members of the Hare family. He wrote all the books here mentioned from 1870 to 1877.

HARE, ROBERT (1781-1858), an American scientist. He early showed an interest in chemistry and physics, and before he was twenty was a member of the chemical society of Philadelphia. In 1801 he invented the oxyhydrogen blowpipe, and later made many valuable contributions to science. In 1818 he became professor of chemistry in William and Mary College, and also accepted a similar position in the medical department of the University of Pennsylvania. He resigned his position in 1847. Later he became a believer in spiritualism, and lectured in its advocacy. He made numerous contributions to scientific literature, and published *Brief View of the Policy and Resources of the United States* (1810); *Chemical Apparatus and Manipulations* (1839); *Compendium of the Course of Chemical Instruction in the Medical Department of the University of Pennsylvania* (1840); *Memoir on the Explosiveness of Nitre* (1850); and *Spiritualism Scientifically Demonstrated* (1855).

HARE, SILAS, a United States Congressman, born in 1827. He served one year in the war with Mexico; was admitted to the Indiana bar in 1850, but shortly afterwards removed to Texas. In 1862 he was chief justice of New Mexico under the Confederate government, and then served till the close of the war as a captain. In 1865 he settled in Sherman, Texas, and was criminal district judge from 1873 to 1876. He was elected to the 50th Congress as a Democrat, and reelected to the 51st.

HARE, WILLIAM HOBART, an American P. E. bishop, born in 1838. He was ordained deacon in 1859, and priest in 1862. In 1864 he was elected rector of the Church of the Ascension in Philadelphia; next became general agent of the foreign committee of the board of missions, and in 1872 was elected missionary bishop of Niobrara. His jurisdiction in 1883 was extended over the southern part of Dakota.

HARELD (*Harelda*), a genus of the duck family, having a short thick bill, and two feathers of the middle of the tail, in the male, greatly elongated. Two species are known; the best known, the long-tailed duck, or hareld (*H. glacialis*), inhabits the arctic regions of the Old and New Worlds, its winter migrations in America extending to the Carolinas.

HARGRAVES, EDMUND HAMMOND, the discoverer of the gold-fields of Australia, born at Gosport, England, in 1815. At the age of eighteen he settled in Australia, and in 1849 was attracted to California, where he tried his luck as a gold-digger. While thus engaged he was greatly struck by the similarity in the geological formation of California and Australia, and on his return home he entered upon explorations which resulted in the discovery of the valuable gold-fields of Australia in 1851. He was appointed commissioner of crown lands, and received from the government of New South Wales a reward of £10,000. In 1855, one year after his return to England, he published *Australia and Its Gold-Fields*.

HARLAN, JAMES, born in Clarke county, Ill., August 25, 1820; graduated at Indiana Asbury University in 1845; became superintendent of public instruction for Iowa in 1847, and president of Iowa Wesleyan University. He sat in the United States Senate as a Whig from 1855 to 1857; was disqualified on a technicality, but reelected the same year, and again in 1861. In 1865 he resigned to become secretary of the interior; was again elected to the Senate in 1866, and served from March, 1867, to March, 1873. In 1869 he was appointed president of the Iowa University. He afterward edited the *Washington Chronicle*, and from 1882 to 1885 was presiding judge of the court of commissioners of Alabama claims.

HARLAN, JOHN MARSHALL, was born in Kentucky, June 1, 1833; graduated in law in 1853, and was a judge in Franklin county, Ky. He was in the volunteer service during the war; was attorney-general of his State (1863-67), and an unsuccessful candidate for governor in 1871 and 1875. On November 29, 1877, he became associate justice of the United States Supreme Court.

HARLESS, GOTTLÖB CHRISTOPH ADOLPH VON, German Lutheran theologian, born in Nuremberg in 1806, died Sept. 5, 1879. He studied at Erlangen and Halle; was professor of theology at Erlangen in 1836-45, and at Leipzig from 1845. In 1850 he became chief court preacher at Dresden, and exercised much influence on ecclesiastical affairs in Saxony. In 1852 he was appointed president of the Protestant consistory at Munich. His most important works were his *Theologische Encyclopädie und Methodologie* (1837); and *Christliche Ethik* (1842.)

HARMALIN, a vegetable base, and *Harmin* another, both of which occur in the husks of the seeds of *Peganum harmalas*, or Syrian rue, a zygo-phylleaceous, shrubby plant that grows abundantly in the steppes of Southern Russia. The seeds have been used in dyeing silk, to which they impart various shades of red.

HARMAN, FRANÇOIS JULES, a French explorer, born at Saumar in 1845, died at Florence, April 14, 1883. As a member of the surgical staff in the French navy he took part in various expeditions. He went to Algeria in the campaign against the Kabyles in 1871, then with Garnier to Tonquin. For some time he was governor of Tonquin. In 1874 he returned to France, but set out for Cambodia the next year, and pushed his explorations far to the north of that country. In 1881 he returned to France seriously ill with consumption, and was made keeper of the colonial museum.

HARMER, ALFRED C., a United States Congressman. In 1856 he was elected a member of the city council of Philadelphia, Pa., and served four years. In 1860 he was chosen recorder of deeds for that city, and held the office three years. He was elected to the 42d, 43d, 45th, 46th, 47th, 48th, 49th, 50th and 51st Congresses.

HARMONIC PROPORTION. Three numbers are said to be in harmonic proportion when the first is to the third as the difference between the first and second is to the difference between the second and third. See *Britannica*, Vol. II, pp. 535-36; Vol. X, pp. 382-83.

HARMONISTS, members of a religious community organized by George Rapp (1770-1847), a German of Württemberg. Disturbed by the authorities, they removed in 1803 to Pennsylvania and formed a settlement which they called Harmony. In 1815 they removed to New Harmony, Ind., but returned to Pennsylvania ten years later, and formed the township of Economy, a few miles from Pittsburgh, where they own a large tract of land and carry on important manufactures. They hold all property in common, and strongly discourage marriage and sexual intercourse.

HARMONY OF THE SPHERES, a music, imperceptible to human ears, which the ancients imagined was produced by the motions of the heavenly bodies. These motions were supposed to be governed by fixed laws, the seven planets producing severally the seven notes of the gamut. By some the sound was thought to be imperceptible because always heard; others thought it too powerful for our hearing.

HARMS, KLAUS, a German divine, born at Fahrstedt, Holstein, May 25, 1778, died at Kiel, Feb. 1, 1855. He studied theology at the University of Kiel, was appointed assistant pastor at Lunden in 1806, and pastor at Kiel in 1817. He exercised a powerful influence on the religious life of Germany and the Scandinavian countries. His memorial work, *Das sind die 95 Thesen oder Streitsätze Luther's* 1817, published in celebration of the ter-centenary of the Reformation, produced a sensation in Germany.

HARMS, GEORG LUDWIG DETLEF THEODOR, a German clergyman, born at Walsrode in Lüneburg in 1808. After studying theology at Göttingen he taught a private school till 1844, when he became the assistant of his father, the pastor of Hermannsburg. In 1849, after he had succeeded his father, Harms founded an institute for training young men as missionaries for Africa. He died in 1865.

HARNACK, ADOLF, born in 1851 at Dorpat, Russia, where he studied in 1869-72. In 1874 he was appointed privatdocent for church history at Leipzig, extraordinary professor there in 1876, and ordinary professor successively at Giessen (1879).

Marburg (1886), and Berlin (1888). In critical knowledge of the sources of church history he is thought to have no superior. His chief writings are: *Zur Quellenkritik der Geschichte des Gnostizismus* (1873); *Die Zeit des Ignatius und die Chronologie der antiochenischen Bischöfe* (1878); *Das Mönchtum, seine Ideale und Geschichte* (1882); and *Lehrbuch der Dogmengeschichte* (1886).

HARNACK, THEODOSIUS, a German Lutheran theologian, born at St. Petersburg in 1817, died in 1889. After studying theology at Dorpat, Bonn, and Berlin, he became in 1843 privatdocent of theology at Dorpat. In 1848 he was made professor in the same place. From 1853 to 1866 he was professor at Erlangen, but in the latter year he returned to Dorpat, and in 1873 he retired from the professorship. He published *Die Idee der Predigt*; *De Theologia practical*; *Der Christliche Gemeindegottesdienst*; *Luther's Theologie*; *Die Kirche, ihr Amt, ihr Regiment*, etc.

HARNETT, CORNELIUS (1723-81), an American statesman. He was a promoter of the Revolutionary cause, and in 1773 was placed on the committee of continental correspondence for the Wilmington, N. C., district. He was president of the Provincial Congress, and a signer of the "articles of confederation and perpetual union."

HARNEY, WILLIAM SELBY, an American soldier, born in 1800. He entered the army in 1818 as second-lieutenant of the 19th infantry, and remained in continuous service until 1863, when he was placed on the retired list, having attained the brevet rank of major-general "for long and faithful service." After his retirement he lived in St. Louis. He died in 1889.

HAROERIS, the elder Horus, son of Seb, the Egyptian Saturn, and Nu, or Rhea; the brother of Osiris. He was ruler over heaven, illuminating the world with the brightness of his eyes.

HARPER, a city of Harper county, Kan., situated about 60 miles southwest of Wichita. Population, 1,579.

HARPER, ROBERT GOODLOB (1765-1825), a United States Senator. At the age of fifteen he served in the army, and in 1786 became a member of the North Carolina bar. He was elected to the legislature, and from 1795 to 1801 served in Congress. He served in the war of 1812, and became a major-general. From 1816 to 1821 he was a United States Senator from Maryland. He published *Observations on the Dispute between the United States and France* (1797); *An Address on the British Treaty* (1796); *Letters on the Proceedings of Congress*; and *Letters to His Constituents* (1801).

HARPER'S FERRY, a post-village of West Virginia, situated among beautiful scenery at the confluence of the Shenandoah with the Potomac, where the latter is crossed by a bridge, 81 miles west of Baltimore by rail. It was the scene of John Brown's Abolition raid in 1859; and here a Union army of over 11,500 men, under General D. H. Miles, surrendered to Stonewall Jackson in 1862. The arsenal and armory were burned in 1861, to prevent their falling into the hands of the Confederates. The most flourishing part of the town was destroyed by a flood in the Shenandoah, 1878. Pop. (1890), 958.

HAARP-SHELL (*Harpa*), a genus of gasteropodous mollusks of the whelk family (*Buccinidae*), having the last whorl of the shell large, and covered with numerous sharp, smooth ribs, resembling the strings of a harp. The foot is large, and there is no operculum. These shells are much prized for their beauty. Nine species are known, all of them tropical, and living in deep water, on sandy or muddy bottoms.

HARRIS, HOWELL, one of the fathers and founders of Welsh Calvinistic Methodism, born in 1713 at Trevecca, Wales, in the county of Brecon. His mind was first seriously awakened to religious questions in 1735, and for seventeen years from that date he spent his time as a lay itinerant preacher, confining his ministrations for the most part to Wales. After his retirement to Trevecca in 1752, he still continued to preach daily at his own home; and in order to accommodate those who came to hear him he built a large house, the inmates of which led a kind of monastic life.

HARRIS, ISHAM GREEN, a United States Senator, born in 1818. He was admitted to the bar in 1841, and commenced practice at Paris, Tenn.; was elected to the State legislature as a Democrat in 1847; was chosen to Congress in 1849, and was re-elected in 1851. In 1853 he moved to Memphis, and from 1857 to 1863 was governor of the State. During the last three years of the war he was a volunteer aid on the staff of the commanding general of the Confederate army of Tennessee. In 1877 he was elected to the United States Senate, and re-elected in 1883 and in 1889. His term of service expires March 3, 1895.

HARRIS, JOEL CHANDLER, an American author, was born in Eatonton, Georgia, December 8, 1848, and was in turn printer, lawyer, and journalist. His delightfully original and unexpected book, *Uncle Remus, his Songs and his Sayings; The Folklore of the Old Plantation* (New York, 1880), quickly carried his name even to the Old World, at once to children and scientific students of folklore. Later works are *Nights with Uncle Remus* (Boston, 1883), *Mingo and Other Sketches* (1883).

HARRIS, SAMUEL, an American clergyman and educator, born in 1814. He taught from 1838 to 1841, and then held pastorates at Conway and Pittsfield, Mass., until 1855. He then became professor of systematic theology in Bangor Seminary, and held the position till 1867, when he was chosen president of Bowdoin College. In 1871 he was made professor of systematic theology at Yale. Among his published works are *Zaccheus; the Scriptural Plan of Beneficence* (1844); *Christ's Prayer for the Death of His Redeemed* (1863); *Kingdom of Christ on Earth* (1874); and *Philosophical Basis of Theism* (1883).

HARRIS, SAMUEL SMITH, an American P. E. bishop, born in 1841. He was admitted to the bar in 1860, and engaged in the practice of his profession in Autauga county, Ala., until 1865, when he removed to New York. In 1869 he was ordained priest, and held pastorates at Montgomery, Ala., Columbus, Ga., New Orleans, La., and Chicago, Ill. In 1879 he was consecrated bishop of Michigan. He published *Bohlen Lectures* (1882).

HARRIS, THADDEUS WILLIAM (1795-1856), an American entomologist. He practiced medicine at Milton Hill, Mass., from 1818 to 1831, and then became librarian of Harvard. In 1837 he was appointed a commissioner for a zoological and botanical survey of Massachusetts. Besides many papers on antiquarian research he published *Insects Injurious to Vegetation* (1841).

HARRIS, THOMAS LAKE, an American spiritualist, born in 1823. He entered the ministry of the Universalist church at an early age, and later organized an "Independent Christian Society." In 1850 he became a convert to the spiritualistic faith, and has since lectured throughout the United States and England. He has published *The Epic of the Starry Heavens* (1854); *Modern Spiritualism* (1856); *A Lyric of the Morning Land* (1854); *A Lyric of the Golden Age* (1856); *Truth and Life in Jesus* (1860); and *The Millennium Age* (1861).

HARRISBURG, the county-seat of Saline county, Ill., situated in a county abounding in salt, iron, coal and lead. Agricultural implements are manufactured here. Pop. (1890), 1,723.

HARRISBURG, the county-seat of Dauphin county, Pa., and capital of the State, pleasantly situated on the left bank of the Susquehanna River, which is here crossed by four bridges, each over a mile in length. Besides the State Capitol building, the city contains a court-house, the State arsenal, the State insane asylum, a Roman Catholic cathedral, and some forty other churches. The State library contains about 60,000 volumes. The city is well provided with schools and academies, having, besides Harrisburg Academy and Miss Woodward's Seminary, about 20 large and a number of small public school buildings. The new water-works are extensive; the streets are macadamized and well lighted. The prosperity of Harrisburg is due chiefly to its facilities for communication with the coal and iron districts of the State; the Cumberland Valley, Northern Central Pennsylvania, Philadelphia and Reading, and the Vanderbilt or Southern Pennsylvania railroads, all centering here, to which the facilities afforded by the Pennsylvania canal with its outlets may be added. As a result of the resources it has large and important manufacturing establishments of iron, steel, boilers, galvanized iron cornices, brick, and tile. Harrisburg is also an important depot for lumber via the Susquehanna River, and has extensive saw and planing establishments. For history, description of capitol building, etc., see Britannica, Vol. XI, p. 494. Population in 1880, 30,762; in 1890, 40,164.

HARRISON, a post-village of Hamilton county, Ohio, 25 miles northwest of Cincinnati. It contains tanneries, flour-mills, brush factories, corn-drill factory, railroad shops, woolen and furniture factories. Pop. (1890), 2,010.

HARRISON, BENJAMIN (1740-1791), a signer of the Declaration of Independence. In 1773 he was a member of the committee of correspondence which united the colonies against Great Britain, and was five times elected to a seat in Congress. He was governor of Virginia in 1782-85, and at the time of his death was a member of the legislature.

HARRISON, BENJAMIN, the twenty-third President of the United States, great-grandson of the preceding, born in North Bend, Ohio, Aug. 20, 1833. He graduated in 1852 from Miami University, and studied law in Cincinnati. In 1854 he removed to Indianapolis, Ind., and gained a large legal practice. In 1862 he entered the United States army, and served with conspicuous gallantry in the Atlanta campaign, returning to civil life at the close of the war with the rank of brevet brigadier-general. In 1876 he was the Republican candidate for governor of Indiana, and in 1881 was chosen to the United States Senate for six years. In 1888 he was nominated on the Republican ticket for President of the United States, with Levi P. Morton for Vice-President. The election resulted in favor of Mr. Harrison, who received 233 electoral votes to 168 for Grover Cleveland, the Democratic nominee. In 1892 President Harrison was again the nominee of his party, with Mr. Whitelaw Reid on the ticket for vice-president, but this time he encountered an overwhelming defeat from the same rival, now President Cleveland.

HARRODSBURG, a town and the county-seat of Mercer county, Ky., said to be the oldest town in the State. It enjoys a reputation for its mineral waters; is the seat of Daughters' College; has a variety of manufacturing establishments, and car-

ries on an important trade in horses, cattle and other live stock. Pop. (1890), 3,230.

HART, the name given to the stag or male deer from the age of six years, when the crown or sur-royal antler begins to appear.

HART, JOEL T., sculptor, born in Clark county, Ky., 1810; died in Italy, 1877. In 1847 Hart went to Italy for study, and while there modeled a statue of Henry Clay, which is at the present time in Richmond, Va. This was followed by a large bronze statue and also a marble statue of the same statesman. During his thirty years' residence in Florence, Hart completed many busts and statues. Of original compositions, his *Charity*, *Woman Triumphant*, and *Penserosa* are among the best.

HART, JOHN (1708-80), a signer of the Declaration of Independence. He served in the provincial legislature for several years, and was a member of the Congresses of 1774, '75, and '76. In 1777-78 he was chairman of the New Jersey council of safety, and when the State was invaded by the British his farm and stock were destroyed and he had to fly with his family to the forest. After peace was restored he returned to his farm and passed the remainder of his days in agricultural pursuits.

BENJAMIN HARRISON.

HART, JOHN SEELY (1810-77), an American author. In 1832 he became tutor in Princeton College, and in 1834 adjunct professor of ancient languages. From 1836 to 1841 he had charge of the Edgehill School; from 1842 to 1859 he was principal of the Philadelphia high-school; from 1863 to 1871 of the State Normal School of New Jersey, and in 1872 became professor of rhetoric and the English language at Princeton.

HART, SOLOMON ALEXANDER, painter, was born at Plymouth, in April, 1806, the son of a Jewish goldsmith, who in 1820 removed to London. Apprenticed first to a line engraver, in 1823 young Hart became a student at the Royal Academy. Amongst his works are *The Elevation of the Law*,

Isaac of York, English Nobility Receiving the Communion, Henry I. Receiving Intelligence of the Death of his Son, Milton Visiting Galileo in Prison, The Three Inventors of Printing. He also painted miniatures and portraits. In 1840 Hart became R.A., in 1854 professor of painting, and in 1865 librarian of the Royal Academy. He died in London, June 11, 1881.

HARTE, FRANCIS BRET, an American author, born in 1839. After a connection as editor with various California newspapers, he was appointed, in 1864, secretary of the United States branch mint, holding the position for six years. In 1868 he began the publication of *The Overland Monthly*, and about this time became widely known as an author. In 1871 he settled in New York City; from 1878 to 1880 he was United States consul at Crefeld, Germany, and from 1880 to 1885 consul at Glasgow, Scotland.

HARTFORD, a city of Connecticut, sole capital of the State since 1873, and county-seat of Hartford county. For an account of the site, history and government of Hartford, see *Britannica*, Vol. XI, pp. 496-497. The population in 1890 was 53,182, being an increase of 11,167 during the decade, and there had been a corresponding increase in the business and wealth of the city, resulting in the erection of new buildings and the improvement of old ones, and the display of business enterprise. A board of trade has been organized. It held its third annual meeting on Jan. 1, 1891, and has a fine building in process of erection. Hartford Theological Seminary has laid the foundation of the Case Memorial Library. The new buildings of Trinity College are, to some extent, a reproduction of those of Trinity College in Glenalmond, Perthshire, Scotland; the new post-office building was completed in 1883 and the county court-house in 1884, and many of the insurance companies and banks have very fine and substantial edifices. There are fifteen miles of street railway, and seven railroads enter the city.

HARTFORD CITY, the county-seat of Blackford county, Ind., 40 miles south of Fort Wayne. It contains a hub and spoke factory, a heading-factory, flour-mill, and a stove factory. Pop., 2,287.

HARTFORD CONVENTION, in the political history of the United States, was an assemblage of delegates from the New England States, at Hartford, Connecticut, December 15, 1814. The war with Great Britain in 1812-14 had been from the first opposed by the majority of the people of New England, who were Federalists, and looked upon the war as a mere party measure of the Democrats; and, in face of the destruction of the commerce and the fisheries, the chief interests of New England, this convention was called with the ostensible object of devising means of security and defense. It sat twenty days with closed doors, and, as it was supposed to be of a treasonable character, it was watched by a military officer of the government. The convention prepared a report recommending the adoption of measures by the state legislatures that would protect their citizens from conscriptions and impressments, and the militia from forcible drafts; the report also proposed certain amendments to the federal constitution. No treasonable act was committed, and no treasonable intention proved; yet the suspicion of disloyal tendencies clung to the convention, and completed the ruin of the Federalist party, which did not survive the election of 1816.

HARTINGTON, SPENCER COMPTON CAVENDISH, MARQUIS OF, born July 23, 1833, and graduated at Trinity College, Cambridge, in 1854. He entered Parliament in 1857, being first returned for North Lancashire, in 1869 for the Radnor boroughs, in 1880 for Northeast Lancashire, and in 1885 for the Ros-

sendale division of that county. Between 1863 and 1874 he held office as a lord of the admiralty, under-secretary for war, war secretary, postmaster-general, and, from 1871, chief secretary for Ireland. On Mr. Gladstone's temporary abdication, in February, 1875, he was chosen leader of the Liberal opposition, and in the spring of 1880, on the downfall of the Beaconsfield administration, was invited by the queen to form a ministry. He rejected the offer, and served under Mr. Gladstone, first as secretary of state for India, and then as war secretary from 1883 to 1885. But he wholly dissented from Mr. Gladstone's scheme of Irish Home Rule, and since 1886, as head of the Liberal Unionists, has stubbornly opposed it. In December, 1891, he succeeded his father as duke of Devonshire.

HARTMANN, ALFRED, a Swiss author, was born Jan. 1, 1814, near Langenthal, in the Canton of Bern, and attended from 1827 to 1831 the schools of Solothurn. After the latter date he studied law in the universities of Munich, Heidelberg, and Berlin. During a prolonged visit to Paris, however, he lost all taste for jurisprudence, and devoted himself to literary pursuits. On returning to his native country he permanently fixed his residence at Solothurn, where he formed a close friendship with the well-known painter Disteli, and where (from 1845) he published a comic periodical called *Postheiri*. But Hartmann became best known through his Helvetic romance, *Meister Putsch und seine Gesellen*, 1858; and, in the department of biography, by his sketch of his friend *Martin Disteli*, 1861; *H. J. Von Staal*, 1861; and *Hory, Kanzler-Denkwürdigkeiten*, 1876. Among his other works may be mentioned, *Junker und Bürger*, 1865; *Schweizernovellen*, 1877; *Neue Schweizernovellen*, and *Fortunat*, 1879.

HARTMANN, EDUARD VON, philosopher, was born in Berlin, in 1842. He entered the Prussian army in 1858; but lameness obliged him to leave the service in 1865, and he took to literature as a profession. His first work, *Philosophie des Unbewussten* (*The Philosophy of the Unconscious*), at once raised him to fame. It was published in 1869, and in 13 years passed through nine editions. An English translation, in three volumes, is published in Trübner's *English and Foreign Philosophical Library*. This has been followed by numerous important works.

HARTMANFT, JOHN FREDERICK (1830-89), an American soldier. In 1859 he was admitted to the bar, and at the beginning of the civil war organized the 4th Pennsylvania regiment. He commanded it during the three months of its enlistment, and then organized the 51st Pennsylvania regiment, becoming its colonel. He was present at the battles of Fredericksburg, Campbell's Station, Knoxville, Vicksburg, the Wilderness, and Spottsylvania, and in 1864 was made brigadier-general of volunteers. The following year he was brevetted major-general. In 1865 he was made auditor-general of Pennsylvania, and reelected in 1868. From 1872 to 1878 he was governor of the State. He became postmaster of Philadelphia in 1879, and in 1880 collector of the port of that city.

HART'S FALLS, a village of Rensselaer county, N. Y., situated on the Hoosac River, near its mouth, and on the Boston, Hoosac Tunnel and Western and the Troy and Boston Railroads. It contains paper and woolen mills, and has manufactories of cassimeres, gunny-cloth, and twine. It was formerly called Schaghticoke Point. Pop., 1,253.

HARTSHORNE, EDWARD (1818-85), an American physician, son of Dr. Joseph Hartshorne. He graduated in medicine at the University of Penn-

sylvania in 1840, and eight years later began practice in Philadelphia. For a time he was a surgeon in Will's Eye Hospital and afterwards in the Pennsylvania hospital. During the war he served as consulting surgeon in the United States Army hospitals and in connection with the United States sanitary commission. He is the author of *Separate System*; notes to Taylor's *Medical Jurisprudence* (1854); and *Ophthalmic Medicine and Surgery* (1856).

HARTSHORNE, HENRY, an American physician, born in 1823. He graduated in the medical department of the University of Pennsylvania in 1845. In 1859 he became professor of the practice of medicine, and in 1865 of hygiene, in the University of Pennsylvania. In 1867 he was given the chair of organic science and philosophy in Haverford College. He has also been a professor in the Pennsylvania College of Dental Surgery, in Girard College, and in the Woman's Medical College of Pennsylvania.

HARTSHORNE, JOSEPH (1779-1850), an American physician. He graduated in medicine at the University of Pennsylvania in 1805, and after two years of travel settled in Philadelphia. From 1815 to 1821 he was surgeon of the Pennsylvania Hospital.

HART'S-TONGUE (*Scolopendrium*), a genus of widely distributed ferns, of which one species, *S. vulgare*, is a native of Britain, and is common in moist woods, on shady banks, in caves on the seashore, and other cold and damp situations. Its fronds are in general undivided, although sometimes forked, and from a few inches to 2 feet in length and from 1 to 3 inches in breadth. The sori are in transverse lines on the lateral veins. Fine plants of this fern are ornamental, and are most luxuriant in winter.

HART, CHARLES FREDERICK, born in New Brunswick, August 23, 1840; died in Brazil, March, 1878. By the invitation of Louis Agassiz he entered the Museum of Comparative Anatomy at Cambridge, Mass. Later he became professor of natural history at Vassar College, and was afterward professor of geology and physical geography in Cornell. He made several exploring trips in the valley of the Amazon, and when on one of these he died.

HARTZENBUSCH, JUAN EUGENIO, a Spanish dramatic poet, born of German parentage, in Madrid, Sept. 6, 1806, died there August 3, 1880. He was intended for the church, and was educated by the Jesuits, but his liking for the drama led him to devote himself to literature. During the greater part of his life he was employed in the National Library at Madrid, of which he became director in 1862.

HARUGARI, a German order established in the United States in 1847. This organization comprises several hundred subordinate lodges, combined into State lodges, and these again into one national lodge. The aims of the order are principally benevolent and social.

HARVARD, a thriving village of McHenry county, Ill., 63 miles northwest of Chicago. It is a railroad junction, has several elevators, railroad repair shops, and manufactories of farm machinery and carriages. Pop. (1890), 1,967.

HARVARD COLLEGE. See COLLEGES, in these Revisions and Additions.

HARVARD, JOHN (1607-38), an American philanthropist, born in England. He sailed for America in 1637, and the same year was made a freeman of Massachusetts. In 1638 a tract of land in Charlestown was deeded to him, where he exercised his ministerial functions. At the time of his death his property was worth £1,500, one half of which he

left for the erection of the college which bears his name. He also gave a library of 320 volumes. See Britannica, Vol. XI, p. 500.

HARWICH, a village of Barnstable county, Mass., on the south side of Cape Cod. It carries on a good fishing and coasting trade.

HASE, KARL AUGUST, a German theologian, born at Steinbach, in Saxony, Aug. 25, 1800, died Jan. 3, 1890. Expelled from Erlangen University for his connection with the political students' unions, he became in 1823 a university tutor at Tübingen, but, as the result of another investigation was afterwards imprisoned for ten months. In 1829 he settled at Leipzig, and in the following year was called to Jena as professor of theology. Here he remained till his retirement in 1883, when he was ennobled and appointed a privy councillor.

HASE, KARL BENEDICT, a German philologist, born near Weimar in 1780, died at Paris, March 21, 1864. After studying philosophy and theology at Jena, he went to Paris, and obtained a position in the Imperial Library in 1805. In 1816 he became professor of Greek palæography and of modern Greek at the *École des Langues Orientales*; in 1830 professor of the German language and literature at the Polytechnic School; in 1832 keeper of manuscripts in the Imperial Library; and in 1852 professor of comparative grammar in the University of Paris.

HASHISH, from which the word *assassin* is derived, is an Arabian preparation of Indian hemp, known in India as *bang* or *siddhi*. It consists chiefly of the leaves and stalks of *Cannabis indica*. The drug is used in the East in various ways. Sometime it is smoked alone or with tobacco. At other times beverages are prepared from it, or it is taken in the form of lozenges or electuaries. The *majoon* of Calcutta, the *mapouchari* of Cairo, and the *dawames* or *dawamesc* of the Arabs are preparations of this kind. The effects differ according to the dose and the idiosyncrasy of the individual. Some become pugnacious, while others fall into a state of reverie. After small doses there is a great tendency to causeless merriment. In most cases there is an extraordinary susceptibility to hallucinations of various kinds.

HASSLER, FERDINAND RUDOLPH (1770-1843), an American surveyor. In 1807-10 he was professor of mathematics in the United States Military Academy, and in 1810-11 occupied a similar position in Union College. He then became first superintendent of the United States coast survey, and was sent to Europe to procure instruments, but was detained in England till 1815 as an alien enemy. In 1818 the work was discontinued and not resumed until 1832. From this time until his death he was at the head of the survey.

HASTINGS, according to the French chroniclers, the name of a viking or sea rover of the 9th century. The shores and cities of France, Spain, Portugal, and Italy are said to have been repeatedly wasted and burned by him and his savage comrades.

HASTINGS, a city and county-seat of Barry county, Mich., on Thornapple River, 32 miles southeast of Grand Rapids. It has a foundry and flouring-mills. Pop. (1890), 2,972.

HASTINGS, a city and county-seat of Dakota county, Minn., on the west bank of the Mississippi River. Carriages, furniture, and flour are manufactured, and the city contains grain elevators, saw mills, and is a wheat and lumber market. Pop. (1890), 3,705.

HASTINGS, a city and county-seat of Adams county, Neb. With the recent rapid growth in population there has been a corresponding growth in

all the important institutions of the city. A land company has been organized. Since 1886 railroad facilities have increased, five roads, with eleven outlets, connecting the city with all parts of the country. Street railway lines have increased to 18 miles. The streets are well paved and lighted. The public buildings are the court house, city hall, opera house, Masonic temple, State asylum for the insane, city hospital, Hastings College (Presbyterian), and Academy (Roman Catholic), and Young Men's Christian Association. There are six fine public school buildings, public library, three daily and four weekly papers, four national banks, one private bank and a loaning company. The water plant is owned by the city. There is a good police force and fire department, also free mail delivery. There are five extensive brick-yards, two flour mills, six lumber yards, two foundries, three sash and door factories, a cold-storage plant and a packing-house. There are thirty-one jobbing houses, and the wholesale trade in 1890 amounted to \$1,250,000. Population in 1880, 4,500; 1890, 13,793.

HASWELL, CHARLES HAYNES, an American civil engineer, born in 1809. In 1836 he was appointed chief engineer of the United States navy, and was a member of the board that designed the steam frigates *Missouri* and *Mississippi*. In 1844 he was appointed engineer-in-chief of the engineer corps, and held the position till 1850, when he left the service.

HATCH, EDWIN, a learned theologian, born at Derby, September 4, 1835. He was educated at King Edward's School, Birmingham, and at Pembroke College, Oxford, and took a second-class in classics in 1857. After some years of teaching as professor of classics at Trinity College, Toronto, and rector of Quebec High School, he returned to Oxford as vice-principal of St. Mary Hall in 1867, a post which he held till his resignation in 1885. He was appointed rector of Purligh, Essex, in 1883, and next year reader in ecclesiastical history at Oxford. The Grinfield lectureship on the Septuagint he held from 1880 to 1884.

HATTON, JOSEPH, born at Andover, England, in 1839; began to write at an early age. He has edited several provincial and London newspapers. In 1865 his first novel, *Bitter Sweets*, a love story, appeared in three volumes and in the following year, *Against the Stream*. This was followed in 1867, by *The Talents of Barton*. In 1868 he was appointed editor of the *Gentleman's Magazine*, which post he held for six years. He has published several novels, and has also occupied himself with adapting plays and stories for the stage.

HATZFELDT, COUNT VON, was born in 1831. His mother was the Countess Sophie von Hatzfeldt, the patroness and companion of Ferdinand Lassalle, the Jew philosopher and social democrat. In 1862 Count Hatzfeldt went to Paris with Prince Bismarck as one of his secretaries, and on the outbreak of the Franco-German war he was one of the select workers who formed the chancellor's diplomatic suite. In 1874 he was appointed imperial minister at Madrid. Soon after the signing of the treaty of Berlin he was sent to Constantinople. After a three years' residence at Stamboul he was recalled to Berlin to succeed Herr von Bülow as foreign secretary. In November, 1885, he was sent as German ambassador to London.

HAUPT, HERMAN, an American engineer, born in 1817. From 1835 to 1839 he was assistant engineer on the public works of Pennsylvania, and from 1844 to 1847 was professor of civil engineering and mathematics in Pennsylvania College. In the latter year he became principal engineer of the

Philadelphia and Columbia Railroad; was made superintendent in 1849; and from 1856 to 1861 was chief engineer of the Hoosac Tunnel in Massachusetts. He served in the civil war as aid to Gen. Irwin McDowell and chief of the bureau of United States military railways. Since 1875 he has been chief engineer of the Tide-water Pipe Line Company. Col. Haupt is the author of *Hints on Bridge-building* (1840); *General Theory of Bridge Construction* (1852); *Plan for Improvement of the Ohio River* (1855); and *Military Bridges* (1864).

HAUPUR, HAPOUR, or HAPUR, a town of India, in the northwest provinces, eighteen miles south of Meerut. The western portion is substantially built, and the streets metaled and drained; the eastern half resembles a large agricultural village, full of cattle. A famous government stud was formerly maintained here. Population, 14,294.

HAUSSMANN, GEORGE EUGÈNE, BARON, a French administrator, born in Paris, March 27, 1809, died there Jan. 12, 1891. Entering the public service under Louis Philippe he distinguished himself in various parts of France, and under Napoleon III., in 1853, rose to be prefect of the Seine. He then commenced his great work of improving and embellishing Paris, which continued until 1870 and imposed a financial burden of \$175,000,000. He was made baron and senator in recognition of his services. There was, however, much dissatisfaction with his enormous expenditures, and the charges of mismanagement being freely made he was dismissed from office in 1870. The following year he was appointed director of the *Crédit Mobilier*, and in 1881 was elected a member of the chamber of deputies. "Haussmannizing" has become a popular term for the destruction of ancient landmarks to make way for improvements.

HAVANA, a post-village and county-seat of Mason county, Ill., situated on the east bank of the Illinois River opposite the mouth of the Spoon River. It is a railroad junction, and has various public buildings and factories. Pop. 1890, 2,525.

HAVANA, a village of Schuyler county, N. Y., at the head of Seneca Lake, eighteen miles from Elmira. It contains machine shops, potteries, and mills, where flour, plaster, and woolen goods are made. Pop. (1890), 1,751.

HAVELOCK, SIR ARTHUR ELIBANK, K. C. M. G., the present governor of Ceylon, born in 1844. In 1877 he was appointed president of Nevis, a beautiful island of the Antilles, with Charlestown as capital, and two years later he became the chief civil commissioner of the Seychelles. His next promotion was in 1881 to the governorship of the West African settlements. In 1885 he became governor of Natal; after he had been created K. C. M. G., he was appointed to the governorship of Ceylon, in March, 1890.

HAVEN, ALICE BRADLEY, an American author, born in Hudson, N. Y., in 1823, died at Mamaroneck, N. Y., in 1863. She wrote sketches for various papers until 1847, when she took editorial charge of the Philadelphia "Saturday Gazette," on the death of her husband, Joseph C. Neal, its editor, her pen-name being "Cousin Alice." She conducted this journal for several years, contributing at the same time to other periodicals. In 1853 she married Samuel L. Haven.

HAVEN, ERASTUS OTIS, an American M. E. bishop, born in Boston, Mass., in 1820, died in Salem, Oregon, in 1881. In 1848 he entered the Methodist ministry in the New York conference, and in 1853 became professor of Latin in Michigan University. From 1856 to 1863 he was editor of the Boston "Zion's Herald," during which time he

served two terms in the Massachusetts Senate. In 1863 he became president of Michigan University; in 1869 of Northwestern University, Evanston, Ill.; in 1872 was made secretary of the M. E. board of education; and from 1874 to 1880 he was chancellor of Syracuse University, N. Y. In the latter year he was ordained a bishop. He published *American Progress; The Young Man Advised* (1855); and *Pillars of Truth* (1866).

HAVEN, GILBERT (1821-80), an American M. E. bishop. In 1846 he became a teacher in Amenia Seminary, N. Y., and in 1851 a member of the New England conference. For the next nine years he preached in churches in Massachusetts, and then traveled in Europe, Palestine, Egypt and Greece. In 1867 he became editor of the Boston "Zion's Herald," and in 1872 was ordained bishop. He is the author of *The Pilgrim's Wallet, or Sketches of Travel in England, France and Germany; National Sermons; Life of Father Taylor, the Sailor Preacher* (1871); and *Our Next Door Neighbor, or a Winter in Mexico* (1875).

HAVEN, JOSEPH (1816-74), an American Congregational clergyman. In 1839 he was ordained pastor of the Congregational church at Ashland, Mass., and from 1846 to 1850 had charge of the Harvard church, Brookline. In 1850 he was made professor of mental and moral philosophy in Amherst College, and in 1853 of systematic theology in the Chicago Theological Seminary. He then traveled in Germany, Palestine and Egypt, and from 1873 until his death was professor of mental and moral philosophy in Chicago University. He published *Mental Philosophy* (1857); *Moral Philosophy* (1859); *Studies in Philosophy and Theology* (1869); and *Systematic Divinity* (published posthumously, 1875).

HAVER, a term used in Scotch law to denote the person in whose custody a document is.

HAVERFORD COLLEGE. See COLLEGES, in these Revisions and Additions.

HAVERGAL, FRANCES RIDLEY, an English writer, born at Astley, Worcestershire, in 1836, died at Caswell Bay, near Swansea, Wales, June 3, 1879. She displayed great talents as a singer, pianist and organist while a child. When grown up she wrote to give expression to her strong religious feelings. Among her many published books, which are all of a devotional character, we mention: *Little Pillows; The Ministry of Song; Morning Bells; Our Work and Our Blessings; Under His Shadow; My King; Kept for the Master's Use; and Swiss Letters* (1882). They are partly in prose and partly in verse.

HAVERHILL, a city of Essex county, Mass., pleasantly situated on the Merrimac River, 18 miles from its mouth, and connected with Boston by the Boston and Maine Railroad. The principal industry is the manufacture of fine boots and shoes, in the production of which the city ranks third in the country. In February, 1882, a large part of the business portion of the city was destroyed by fire, involving a loss of nearly \$2,000,000. Rebuilding was promptly begun. See *Britannica*, Vol. XI, pp. 526-27. Population in 1880, 18,472; in 1890, 27,322.

HAVERHILL, a village and one of the county-seats of Grafton county, N. H., located on the east bank of the Connecticut River. In the township, leather, lumber, whetstones, paper, starch and boxes are made. Pop. (1890), 2,545.

HAVERSTRAW, a post-village and railroad junction of Rockland county, N. Y., situated on the Hudson River, 38 miles from New York City. It has a paper mill, large print works, a rolling mill for copper, and engages extensively in the manufacture of brick. Pop. (1890), 5,170.

HAVIDLAR, highest rank of non-commissioned officer among native troops in India and Ceylon.

HAVRE DE GRACE, a village of Harford county, Md., on the south bank of the Susquehanna River. It has a fine harbor, ship-yards, a trade in lumber and coal, flour mills, fruit-canning factories, and extensive fisheries. The famous canvas-back ducks are obtained in the vicinity. Pop. (1890), 3,244.

HAWAIIAN ISLANDS, a group of 12 islands (8 inhabited and 4 uninhabited) in the North Pacific Ocean. Area, as officially stated in 1891, 6,640 square miles. Population, 80,578. Capital, Honolulu (on the southwest coast of Oahu), with a population of 20,487. For the history, government, productions and early statistics, see *Britannica*, Vol. XI, pp. 528-32.

In 1843 the independence of the Hawaiian government was formally guaranteed by the English and French governments. Kamehameha III. was succeeded by Kamehameha IV. in 1854. He was succeeded by his brother in 1863. When Kamehameha V. died in 1872 it ended the line of the Kamehamehas and a chief named Luñailo was elected to the throne. He died in 1874 and another chief, Kalakaua, was elected. In 1886 the unsatisfactory state of the public finances demanded a change in the system, and a new constitution was adopted in the following year. Under it the members of both houses of parliament are elected by the vote of all the adult male subjects, under the provisions of an educational qualification on suffrage, and, in the case of the house of nobles, a property qualification. The judiciary power is lodged in a supreme court, composed of a chief justice, who is also a chancellor, and at least two judges, district courts, police, and other tribunals.

King Kalakaua died at the Palace Hotel in San Francisco, Jan. 20, 1891, of Bright's disease. His visit to this country was on account of his health. King Kalakaua was a great traveler. He visited this country in 1876 and visited most of the principal cities. It was his travels and extravagance that caused the financial troubles that led to a change in the form of government. Princess Liliuokalani succeeded her brother and has since been the Queen of the Hawaiians. Her husband is an Englishman.

Liliuokalani has proved herself to be an erratic and self-willed ruler. She has constantly been at variance with her legislature and advisers, and in January, 1893, attempted to promulgate a new constitution, depriving foreigners of the right of franchise and abrogating the existing house of nobles, at the same time giving herself power of appointing a new house. This was resisted by the foreign element of the community, who at once appointed a committee of safety, consisting of thirteen members, who called a mass meeting of their class, at which 1,200 or 1,500 were present.

That meeting unanimously adopted resolutions condemning the action of the queen and authorizing a committee to take into further consideration whatever was necessary to protect the public safety. The committee issued a proclamation to the Hawaiian people, formed itself into a provisional government, took possession of the national property, and sent commissioners to the United States inviting this Republic to annex the Hawaiian Islands. A treaty to that end was proposed by President Harrison in February, 1893.

The naval and military forces consisted of 250 men, authorized by law, and a volunteer force—the Honolulu Rifles—of 250 men. All natives are liable to serve if called on.

AREA OF THE ISLANDS AND MOVEMENT OF POPULATION.—The areas of the island groups are as follows: Hawaii, 4,210 square miles; Maui, 760; Oahu, 600.

Kauai, 590; Molokai, 270; Lanai, 150; Niihau, 97; Kahoowe, 63.

According to the census in 1884, the population was 80,578—51,539 males, and 29,039 females; and according to the census of 1890, 89,990—58,714 males, and 31,275 females. Of the population in 1890, 34,436 were natives, 6,186 half-castes, 7,495 born in Hawaii of foreign parents, 15,301 Chinese, 12,360 Japanese, 8,602 Portuguese, 1,928 Americans, 1,344 British, 1,034 Germans, 227 Norwegians, 70 French, 588 Polynesians, and 419 other foreigners. The native population is closely allied to the Maoris of New Zealand. At the time of Captain Cook's discovery of the islands, upwards of a century ago, the population numbered probably 200,000. Since then the natives have rapidly decreased, and since the census of 1884 there has been a decrease in the native population of 5,578. The foreign element is, however, rapidly increasing. The total arrivals in 1883 were 11,194; departures, 3,535; the immigration in 1884, was 7,654, and emigration 4,941; in 1885 the former, 5,410, and the latter, 1,805; in 1886 there were 3,725 arrivals and 2,189 departures; in 1887, arrivals 3,250, departures 2,220; in 1888, 5,532 arrivals, 2,890 departures; in 1889, 3,671 arrivals, 2,313 departures; in 1890, 2,484 arrivals, 1,852 departures; excess of arrivals 632. Most of the immigrants are Chinese and Japanese. The capital, Honolulu (20,487 inhabitants), is in the island of Oahu.

All forms of religion are permitted and protected. Nearly all the natives are Christians. The sovereign belongs to the Presbyterian Church. There is a Church of England, of which there is a bishop at Honolulu; there is a Roman Catholic bishop, and ministers of various denominations. According to latest statistics there are 29,685 Protestants, 20,072 Roman Catholics, 72 Jews, 3,576 Mormons, 30,821 undesignated. Schools are established all over the islands, the sum allotted for public instruction in 1890-92 being \$326,922. In 1890 there were 178 schools, with 10,000 pupils; of the pupils, 5,559 were Hawaiians and 1,573 half-castes.

The estimated revenue of Hawaii for 1890-92 was \$2,862,505; expenditure, \$2,853,116. The revenue is largely derived from customs (\$1,082,766 in 1888-90) and internal taxes (\$901,803 in 1888-90), while the largest item of expenditure for the interior was \$1,180,125, (1888-90). The debt on March 31, 1890, was \$2,599,502. The interest varies from 5 to 7 per cent.

The islands are to a great extent mountainous and volcanic, but the soil is highly fertile and productive. Sugar and rice are the staple productions, while coffee, hides, bananas and wool are also exported.

Of the reports of 1890, sugar was valued at \$12,159,585 (259,000,000 lbs.); rice, \$545,239; bananas, \$176,351; hides, \$70,949; the imports are mainly groceries and provisions, clothing, grain, timber, machinery, hardware, cotton goods. Ninety-one per cent. of the trade is with the United States.

Steamers connect the islands with the American continent, Australasia, and China. In the inter-island traffic, 20 steamers and 28 sailing vessels are constantly engaged. In 1889 there were 59 vessels belonging to the islands, of 15,403 tons. There are about 56 miles of railway in the islands of Hawaii, Maui, and Oahu. There are telegraphs in the islands of Maui, Hawaii, between Hawaii and Oahu, and around the latter island; total length, 250 miles; nearly every family in Honolulu has its telephone. In the two years, April 1, 1888, to March 31, 1890, the total number of letters, etc., transmitted and received by the post-office was 3,159,034; there were 54 post-offices. Postal savings banks, 1890: depositors, 2641; amount, \$956,999. Honolulu is lighted by electricity and has lines of tramways. The

various islands will shortly be connected by telegraphic cable.

HAWARDEN (pronounced *Harden*), a small market-town of Flintshire, North Wales, seven miles west of Chester. The church, almost destroyed by fire in 1857, was restored from designs by Sir G. G. Scott. A free library was opened in 1889. Hawarden Castle, the seat of the Right Hon. W. E. Gladstone, dates from 1752. The park contains the ruined circular keep of a 13th-century castle, which commands a good view of the valley of the Dee.

HAWELS, HUGH REGINALD, an English clergyman and author, born at Egham, Surrey, in 1838. He received his education at Trinity College, Cambridge, and graduated in 1859. After being curate of some London churches for six years he was appointed incumbent of St. James Church, Marylebone, in 1866. He took a great interest in the welfare of the lower classes, diffused knowledge among them by his *Penny Readings*, and advocated the opening of the museums on Sundays. In 1868 Hawels was made editor of "Cassell's Family Magazine," and in 1885 he visited the United States.

HAWES, JOEL (1789-1867), an American Congregational clergyman. In 1818 he was ordained pastor of the first Congregational church in Hartford, Conn., and was sole pastor until 1860, senior pastor until 1864, and pastor *emeritus* until his death.

HAWESVILLE, the county-seat of Hancock county, Ky., on the Ohio River. Tobacco-raising and coal-mining are the chief occupations. This village is in the center of the Kentucky coal-beds, and eight mines are in operation. Pop. (1890), 1,013.

HAWKBIT, the *Leontodon autumnale*, or fall dandelion, a plant of weedy aspect, belonging to the natural order *Compositæ*, closely related to and formerly included with the dandelion, from which it has been separated on account of its feathery pappus. The name is due to the deep, tooth-like lacerations of the leaves. The species are natives of Europe, but are naturalized in parts of the United States.

HAWKERS, also called PEDDLERS, or, in England, petty chapmen, persons who go from town to town, or door to door, selling goods or merchandise, or exercising their skill in handicraft. In the United States hawkers are generally required to take out licenses under the local laws of the several States. In some States and Territories, as Florida and Arizona, and in the District of Columbia, commercial travelers must pay a license-fee of from twenty-five to two hundred dollars; while in Pennsylvania it is a great misdemeanor to sell goods unless the agent or his principal be a tax-payer of the State. But in many States no such law has ever been enacted; and in others, as in Montana and Nevada, similar acts, although on the statute-book, are held to be unconstitutional, and are not enforced. In England hawkers who use beasts of burden, and hawkers who go from place to place, hiring rooms or booths for the exhibition of their wares, are by the hawkers' act, 1888, required to take out an annual or half-yearly license from the excise, which is valid all over the kingdom.

HAWKE'S BAY, a provincial district of New Zealand, on the east coast, between Auckland and Wellington. Area, 4,765 square miles; population, 24,568. It presents rich alluvial plains and undulating hills, with enormous forests. The bay known as Hawke's Bay was first entered by Captain Cook on October 8, 1769, and was so named after Sir Edward Hawke, then first lord of the admiralty. It is almost all suitable for farming, and the forests are of enormous extent. Napier is the port and chief city.

HAWKSBEARD (*Crepis*), a genus of annual and biennial plants belonging to the natural order Compositae, so closely related to Hawkweed (*Hieracium*) that some of the species are referred to the one genus or the other according to the peculiar views of individual botanists. The species are widely distributed through Europe and Asia. Doubtful medicinal properties have been ascribed to several species, and *C. lacera*, a native of the Apennines, is said to be poisonous.

HAWKESBURY, a river of New South Wales, which rises in the Cullarin range, and under the names of Wollondilly and Nepean flows northeast; then turns as the Hawkesbury southeast, and enters the Pacific at Broken bay, about twenty miles northeast of Sydney. Its length is 330 miles, and it is navigable for vessels of one hundred tons as high as Windsor. The Hawkesbury is crossed by a steel girder bridge (1886-89) on the railway between Sydney and Newcastle. This bridge is one of the largest structures of its kind in the world, and completes the system of railway communication between Brisbane and Adelaide.

HAWKESBURY, a Canadian lumbering village of Prescott county, Ont., situated on the Ottawa River, across from Grenville.

HAWKINSVILLE, a city and county-seat of Pulaski county, Ga., 40 miles south of Macon. It has cotton ware houses, grist mill, and manufactures carriages, wagons, and cotton goods. Pop. 1,755.

HAWKS, FRANCIS LISTER (1798-1866), an American Episcopal clergyman. In 1819 he was admitted to the North Carolina bar, but after a few years of marked success in the practice of law took up the study of theology, and was ordained deacon in 1827, and priest shortly afterward. In 1829 he became assistant rector of Trinity church, New Haven, Conn., and the same year at St. James's, Philadelphia. In 1830 he was made professor of divinity in Trinity College, and in 1831 became rector of St. Stephen's church, New York. From December of 1831 to 1843 he was rector of St. Thomas's, New York, and from 1845 to 1849 of Christ church, New Orleans. In the latter year he returned to New York, and became rector of Calvary church. In 1862 he resigned and went to Baltimore, where he became rector of Christ church, but in 1865 returned to New York. He was the author of many important works on legal, ecclesiastical, and other subjects.

HAWKSBEER, or **HAWKSBERE**, FRANCIS, English natural philosopher, born in the latter half of the 17th century, and died about 1730. He was admitted a fellow of the Royal Society in 1705, and appointed curator of experiments to the society, and in 1723 was elected assistant secretary. He carried further the tentative observations by Dr. Gilbert and Boyle (see *Britannica*, Vol. VIII, pp. 3-4) on the subject of electricity, and by his experiments laid the scientific foundations of that branch of knowledge. He contributed forty-three memoirs to the "Philosophical Transactions," chiefly on chemistry and electricity, between 1704 and 1713. His chief independent work, published in 1709, was entitled *Physico-Mechanical Experiments on Various Subjects*. He is also well known as the improver of the earlier air-pumps of Boyle, Papin, and Hooke, and as the first who used glass in the electrical machine.

HAWLEY, a village of Wayne county, Pa., situated on the Lackawaxen River, eight miles southeast of Honesdale. It is a railroad junction, and has a large business in the transfer and forwarding of coal. Pop. (1890), 1,968.

HAWLEY, JOSEPH ROSWELL, a United States Senator, born in 1826. He was admitted to the

Connecticut bar in 1850, and in 1857 became editor of the Hartford "Evening Press," which was consolidated with the "Courant," of which he is editor, in 1867. He enlisted in the Union army as a lieutenant in 1861; became brigadier and brevet major-general, and in 1866 was mustered out. In April of the same year he was chosen governor of Connecticut, and in 1872 was made a member of Congress. In 1881 he took his seat as a United States Senator, and was reelected in 1887 and 1893. His term of service expires March 3, 1899.

HAWSE (akin to *heel*, *hals*, "the neck"), part of a vessel's bow, in which the hawse-holes are cut. Through the hawse-holes the cables pass which hold the vessel when she is moored with two anchors out forward—one on the starboard, the other on the port bow. *Hawser* is a small cable or a large rope.

HAWTHORNE, JULIAN, an American author, son of Nathaniel Hawthorne, born in 1846. He was engaged in various occupations until 1871, when he decided to devote himself entirely to literature. He has published: *Bressant* (1873); *Idolatry* (1874); *Garth* (1875); *Sebastian Strome* (1880); *Fortune's Fool* (1883); *Dust*, and *Noble Blood* (1884); besides numerous novelettes and short stories. He edited his father's posthumous romance, *Dr. Grimshaw's Secret*.

HAY. See AGRICULTURE and GRASSES, in these Revisions and Additions.

HAY, JOHN, an American author, born in 1838. In 1861 he was admitted to the bar of the Supreme court of Illinois, but immediately afterward became assistant secretary to President Lincoln. He acted also as his adjutant and aid-de-camp, and served for some time under Gen. Hunter and Gen. Gillmore. He was first secretary of legation at Paris, *chargé de affaires* at Vienna in 1867-68, and then secretary of legation at Madrid. From 1870 to 1875 he was on the editorial staff of the New York "Tribune," and from 1879 to 1881 was first assistant Secretary of State. He published *Pike County Bal-lads* (1871); *Castilian Days* (1871); and, with John G. Nicolay, *History of the Administration of Abraham Lincoln*.

HAYBOTE, an implied right of a tenant to take wood off the land he occupies to repair the hedges, gates and fences thereof.

HAYDEN, FERDINAND VANDEVEER (1829-87), an American geologist. In 1853 he explored the "Bad Lands" of Dakota, and in 1854-55-56 was in the basin of the upper Missouri. From 1859 to 1862 he was naturalist and surgeon to the expedition sent out to explore the Yellowstone and Missouri Rivers under Capt. W. F. Reynolds, and in the latter year became assistant surgeon of volunteers in the United States Army. In 1863 he was promoted full surgeon, and in 1865 resigned with the brevet of lieutenant-colonel. From 1865 to 1872 he was professor of mineralogy and geology in the University of Pennsylvania. He then became connected again with the government geological surveys, and remained in charge of the Montana division until 1886, when failing health compelled him to resign. He was the author of numerous scientific papers and government reports.

HAYES, ISAAC ISRAEL (1832-81), an American explorer of the Arctic regions. In 1853 he sailed as surgeon of the second Grinnell expedition in search of Sir John Franklin, and was the first civilized man to place foot on Grinnell Land. In 1860 Dr. Hayes sailed in command of the *United States*, and claimed to have reached a point which he called Cape Lieber, in lat 81° 35' N., long. 70° 30' W. Some explorers, however, surmise that his calculations were incorrect, and that he reached Cape

Joseph Good, about lat. 80° 15' N., long. 70° W. In 1863 Hayes again entered the Arctic Circle in the *Panther*. During the civil war he was surgeon of volunteers, and attained the brevet rank of lieutenant-colonel. He published *An Arctic Boat Journey* (1860); *The Open Polar Sea* (1867); *Cast Away in the Cold: a Story of Arctic Adventure for Boys* (1868); and *The Land of Desolation* (1871).

HAYES, RUTHERFORD BIRCHARD, the nineteenth President of the United States, born in Delaware, Ohio, Oct. 4, 1822. He began the practice of law at Lower Sandusky in 1845, and in 1850 removed to Cincinnati, where he was city solicitor in 1859-60-61. At the outbreak of the civil war he was appointed lieutenant-major of the 23d Ohio infantry, and shortly afterward lieutenant-colonel. He distinguished himself in the campaigns of West Virginia, and in the battles around Winchester. At South Mountain he was severely wounded. In 1864 he was promoted brigadier-general, and the following year was brevetted major-general. From 1864 to 1866 he was a member of Congress from Ohio, and

R. B. HAYES.

from 1867 to 1875 was governor of the State. In 1876 he was the Republican candidate for President of the United States. At the following election he was chosen over Mr. Samuel J. Tilden, by a majority of one vote in the Electoral College, and Mr. Hayes was inaugurated March 5, 1877. As President his career was marked with moderation, wisdom, and a sympathy with all true reforms. His independence of character was shown by his vetoes, his steady adherence to principle, and his refusal to pander to mere party politics. His term expired March 3, 1881, and Mr. Hayes retired to his home in Fremont, Ohio. He died in January, 1893.

HAYES, WALTER L., a United States Congressman, born in 1841. He was admitted to the Michigan bar in 1863; was city attorney for Marshall; was United States Commissioner for the eastern district of Michigan, and also for Iowa; was city solicitor of Clinton, Iowa, and was district judge of

the seventh judicial district of Iowa from 1875 to 1887. He was elected as a Democrat to the 50th Congress, and reelected to the 51st, 52d and 53d.

HAYNAU, JULIUS JAKOB, BARON VON, Austrian general, born at Cassel, Germany, Oct. 14, 1786, died at Vienna, March 14, 1853. Entering the Austrian service in 1801, he became noted during the Italian campaigns of 1848-49 for military skill and ruthless severity. He was engaged in the siege of Venice, when he was summoned by the emperor to Hungary, in May, 1849, to take the supreme command of the forces in that country. The storming of Raab, his victory at Komorn, his occupation of Szegedin, and his victories on the Theiss contributed materially to the final success of the imperialists; but his atrocious severity towards the defeated Hungarians excited the detestation of Europe. Appointed governor of Hungary after its pacification, he was dismissed in 1850 for insubordination.

HAYNE, ISAAC, a patriot, born in South Carolina in 1745; was a wealthy planter and iron founder at the beginning of the Revolution, and at the same time was State Senator of South Carolina. He took the field as a captain of artillery. In 1780, when the British invaded his State, Hayne served in a cavalry regiment. At the capitulation of Charleston he was paroled. In 1781 he with others, was required to join the royal army, and, being assured that he would not be made to bear arms against his country he took the oath of allegiance. Afterwards he was summoned to join the army immediately, and as this was in violation of the promises made to him he went to the American camp and was commissioned colonel of a militia company. In July, 1781, he captured Gen. Andrew Williamson, a former patriot, who had gone over to the British. But the British captured Hayne in return, threw him into the provost's prison, and after a brief examination hanged him at Charleston.

HAYNE, PAUL HAMILTON, an American poet, was born at Charleston, S. C., in 1831, and died July 6, 1886. He received his education at the Charleston schools. He published a volume of poems in 1855, a second in 1857, and a third in 1859. During the civil war Hayne wrote some fiery poems which were reprinted in Simms's *War Poetry of the South*. In 1872 he published *Legends and Lyrics*, and in 1873 he edited the *Poems of Henry Timrod*.

HAYNE, ROBERT YOUNG, was born in South Carolina, in 1791, and died in 1839. He practiced law in Charleston, and from 1818 to 1822 was attorney-general of his State, and in 1822 was elected United States senator. He opposed the tariff measures proposed in 1828, and his oratorical efforts in opposition to Henry Clay are of historical record. The great debate between Daniel Webster and Mr. Hayne upon the principles of the constitution, and the rights of the individual States, is also of historical value. In 1832 Mr. Hayne was elected governor of South Carolina.

HAYS, ISAAC, an American physician, born at Philadelphia in 1796, died there April 12, 1879. He graduated at the University of Pennsylvania and practiced in Philadelphia, especially as an oculist. In 1820 he became editor of the "American Journal of Medical Science," and had sole charge of it till 1869. In the latter year was associated with him his son, Dr. I. Minis Hays, who still edits the periodical. In 1843 Dr. Hays also established a monthly, called "Medical News," and in 1874 the "Monthly Abstract of Medical Science." He also edited *Wilson's American Ornithology*, and a number of medical works. The code of ethics of the American Medical Association was framed by Dr. Hays. It has been adopted by every medical society in the United

States. He was president of the Philadelphia Academy of Natural Sciences from 1865 to 1869. He edited Wilson's *American Ornithology*, and was the author of several useful works on medicine and the natural sciences.

HAYTER, SIR ARTHUR DIVETT, British statesman, was born in 1835. He was educated at Eton, and at Balliol and Brasenose Colleges, Oxford; he graduated in classical honors in 1857. In 1856 he obtained a commission in the Grenadier Guards, retiring in 1866 with the rank of captain. Sir Arthur Hayter was in the House of Commons as representative for Wells from 1865 till 1868, when he unsuccessfully contested East Somerset. In 1873 he was elected as member for Bath, in the Liberal interest. He succeeded to the baronetcy on the death of his father in 1878. In 1880 he was appointed a lord of the treasury, and in May, 1882, he succeeded Mr. Campbell-Bannerman as financial secretary at the war office. In 1885, and again in 1886, he stood for Bath, but was both times defeated.

HAYTI, a Republic, formerly a French colony, now governed by a constitution adopted June 14, 1867. Area (embracing the western portion of the island of Hayti), 10,204 square miles. Population (there is no official census) estimated in 1891, by best authorities, at 572,000, about nine-tenths of whom are colored persons. Capital, Port-au-Prince, with a population, in 1891, of about 40,000. For early history, productions, government, and statistics, see *Britannica*, Vol. XI, pp. 543-46.

The religion of the Republic is chiefly Roman Catholic. Public elementary education is free. There were in 1891 about 400 national schools, besides several private schools, and five public lycées. As a result largely of long-continued civil war, there has been much disorder in financial affairs, and in 1890 there was an external government debt of \$4,320,000, and an internal debt of \$9,180,000; total, \$13,500,000.

The army, under a "law of reorganization" passed in 1878, consists nominally of 6,828 men, chiefly infantry. There is a special "guard of the government," numbering 650 men with 10 generals, who act as aids to the president. In 1890 Hayti had one gun-vessel of 900 tons, a corvette, and two sloops.

In 1888 the total imports were valued at 7,543,294 piastres; exports valued at 13,250,307 piastres. The chief articles exported were: Coffee, 84,028,583 pounds; cacao, 9,927,089 pounds; mahogany, 39,262 ft.; logwood and cotton, 242,219,476 pounds—the latter chiefly to France.

The following is a list of the presidents of Hayti, from the date of the Republic:

Presidents.	Assumed Office.
Gen. Fabre Geffrard.....	Jan. 23, 1859
Sylvetre Salnave.....	March 27, 1867
Gen. Nissage Saget.....	May 15, 1870
Michel Domingue.....	May 15, 1874
Boisrond Canal.....	July 1876
Gen. Salomon.....	Oct. 22, 1879
Gen. Légitime.....	Oct. 22, 1888
Gen. L. M. L. Hippolyte.....	Oct. 17, 1889

The present constitutional term is for 7 years; salary of the president, £4,800—(\$24,000).

The historic outline for the last decade has been largely interwoven with that of San Domingo, which embraces the eastern portion of the island of Hayti. On Jan. 1, 1880, the Republic of Hayti was reported as "tranquil," and this state of things continued notwithstanding serious government trouble in San Domingo until 1883, when a negro insurrection broke out in Port-au-Prince; but this was suppressed September 22d, of the same year. In 1886 great troubles arose because of large thefts

of funds from the national bank of Hayti, resulting in convictions of doubtful desert and imprisonments against which the English and American governments protested. The prisoners were soon after released. In 1888 a revolution took place in Hayti, and Salomon was deposed. He fled to Cuba August, 1878, and died in Paris, Oct. 19, 1888. A little later an insurrection took place under Gen. Télémaque, and during the month of October, while engaged in an attack on the Palais National at Port-au-Prince he was killed with about 300 of his followers. Gen. Légitime was elected president Oct. 22, 1888, and Gen. Hippolyte was installed as president at Haytien, Jan. 1, 1889. A conflict of authority and immediate war followed. Légitime was defeated Jan. 29, 1889, and Gen. Hippolyte was defeated Feb. 20, 1889; subsequently the latter advanced on Port-au-Prince, and soon became re-established in office. During 1891 there was another outbreak at Port-au-Prince, which Hippolyte suppressed with great severity, finally extending amnesty to the lesser participants in January, 1892.

HAYWARD, ABRAHAM, essayist was born at Wishford, in Wiltshire, October 31, 1802. He had neither public school nor university education, but after keeping terms at the Inner Temple was called to the bar in 1832. His leanings were, however, more to letters than to law, yet he founded and edited the *Law Magazine*, and to every one's surprise was made Q. C. by Lord Lyndhurst in 1845. He published in 1833 his excellent prose translation of the first part of *Faust*, and soon became a busy contributor to the newspapers and magazines, especially the *Quarterly Review*, in which readers soon learned to recognize his personality in an unusual combination of vivacity, epigrammatic verve, and critical acumen. By his brilliant conversation, his wealth of anecdotes, his whist-playing, and his artistic interest in "the art of dining" he delighted society almost down to his death, at London, February 2, 1884.

HAZARD, ROWLAND GIBSON, an American manufacturer and philosopher, born at South Kingston, R. I., in 1801, died in 1888. Being engaged from his youth in manufacturing pursuits he accumulated a large fortune. In 1841, while in New Orleans, he secured the release from the chain gang of many free negroes who belonged to vessels from the North. He was twice elected to the State legislature of Rhode Island, and in 1866 also to the State senate.

HAZARD, SAMUEL, an American antiquarian, born at Philadelphia, in 1784, died there May 22, 1870. Ebenezer Hazard, the first postmaster-general of the United States was his father. S. Hazard was first engaged in mercantile pursuits, and made several voyages to the East Indies.

HAZEN, WILLIAM BABCOCK, an American general, born at West Hartford, Vt., in 1830, died in 1887. He graduated at West Point in 1855, and served in the Eighth infantry against the Indians in California, Oregon and Texas. In 1861 he became assistant professor of infantry tactics at West Point, and was made a captain in the same year. Soon after this he took command of the Forty-first Ohio regiment, and joined Gen. Buell's army. In 1862 he was appointed to command a brigade. Hazen was with Buell in Alabama, fought bravely at Shiloh, and afterwards drove the Confederates from Danville, Ky. At the battle of Stone River he saved the left wing from being vanquished. After the battle of Chickamauga he deprived the Confederates of the advantages they had gained, and relieved the army at Chattanooga. At Missionary Ridge he captured 18 cannons. During Sherman's famous march to the sea Hazen commanded a division.

With this he captured Fort McAllister, Dec. 13, 1864, and was promoted major-general of volunteers. Afterwards he took part in forcing Johnston to surrender, and was made commander of the Fifteenth corps, May 19, 1865. After the war Hazen was made colonel of the Sixth infantry of the Regular Army. In December, 1880, he was appointed chief signal officer, with the rank of brigadier-general. While in this office he sent Lieut. Greeley to Lady Franklin Bay to make meteorological observations, introduced the "cold-wave signals," promoted the use of local and railway weather signals, organized special observations for the cotton-producing States, established frost warnings, and initiated forecasts for vessels coming to this country from Europe. He published: *The School of the Army in Germany and France, with a Diary of Siege-Life at Versailles*, in 1872.

HAZLETON, a city of Luzerne county, Pa. Its location, in the midst of a great coal region, and on two great railroads, the Lehigh Valley and the Pennsylvania roads, has been favorable to its leading industries. Among its manufactures are undertakers' supplies, pianos and organs, spring guns, iron and flour, and a beef company, established in 1884, does an extensive business. The public schools are excellent. The miners' new hospital is an extensive and commodious building. There are public halls and numerous churches. There are two daily, one semi-weekly, and two weekly papers, and three banks in the city. Population in 1880, 7,161; 1890, 11,818. See *Britannica*, Vol. XI, p. 549.

HEADACHE can scarcely ever be called a disease, but it is a common symptom of many ailments. It is sometimes caused by serious mischief within the cranium, but far more frequently it depends upon an alteration in the quality of the blood, or in a deficient or excessive supply of it to the head. The deterioration in quality may be caused by fevers, by inflammations of various organs—e. g. the kidneys, or even by breathing the air of a crowded room. The congestive form of headache is often produced by mere mechanical obstruction to the return of blood from the head. A tight collar or an awkward position of the neck during rest may cause it. This form of headache is aggravated by stooping. On the other hand the anæmic variety is often relieved by lying down. The neuralgic headache is one of the commonest of all, and is especially associated with the hysterical tendency. Another variety which is on the increase in this hurried and hard-driven generation is that caused by excessive brain-work. Lastly, there is the sick headache, *megrin* or *migraine*, which comes on periodically in paroxysms, often associated with bilious vomiting.

HEADLEY, JOEL TYLER, an American author, born at Walton, Delaware county, N. Y., in 1814. After graduating at Union College in 1839 he studied theology at Auburn Theological Seminary, and became pastor of a church at Stockbridge, Mass. Ill-health soon obliged him to give up pastoral work. In 1842 he went to Europe, and on his return published *Letters from Italy and the Alps and the Rhine*. In 1855 he was elected Secretary of State of New York.

HEADLEY, PHINEAS CAMP, an American author, born at Walton, N. Y., in 1819. He studied law and was admitted to the bar in 1847. Afterwards he studied theology in the Seminary at Auburn, N. Y., and held pastorates in the Presbyterian and Congregational churches.

HEALDSBURG, a city of Sonoma county, Cal., situated on the San Francisco and North Pacific Railroad, 66 miles north of San Francisco, and 20 miles from the ocean. It has an academy, a graded

school, and manufactories of chairs, baskets and wine. Population (1890), 1,485.

HEALY, GEORGE PETER ALEXANDER, an American portrait painter, born at Boston, Mass., in 1813. He studied for several years in Paris, and painted afterwards the portraits of Louis Philippe, Marshal, Sout, Lewis Cass, Clay, Calhoun, Daniel Webster, Seward, Pierce, Gen. Sherman, William H. Prescott, H. W. Longfellow, Cardinal McCloskey and Stephen A. Douglas. In 20 years he executed nearly 600 portraits. In 1851 he completed his large historical picture of *Webster's Reply to Hayne*, which contains 130 portraits and hangs now in Faneuil Hall, Boston. In 1855 he exhibited at Paris a large picture representing Franklin urging the claims of the American colonies before Louis XVI, besides a series of 13 portraits. To the Philadelphia Centennial Exhibition he sent portraits of Thiers, the Princess of Roumania, Elihu B. Washburn, and Lord Lyons.

HEALY, TIMOTHY M., a member of Parliament, born at Bantry, Ireland, in 1855. He took an active part in the Land League agitation in 1880, and was arrested on a charge of intimidation, but was acquitted at the trial. Elected to parliament without opposition, he took a lively interest in the discussions of the Land Bill of 1881, and obtained the insertion of the clause which excluded the improvements made by tenants from rent. This clause was since known as the *Healy clause*. In 1882 he was sentenced to imprisonment for six months for intimidation; but he was released after four months' service. In 1884 Healy was called to the Irish bar, and was afterwards one of the counsel for the scheduled members before the Parnell commission. In the Parliamentary session of 1890 Healy delivered many speeches in Ireland's cause, and appeared on behalf of the Irish members at Tipperary. In 1892 he was returned for North Louth.

HEARD, JOHN T., a United States Congressman, born in 1840. He was admitted to the Missouri bar in 1862, and in 1872 was chosen to the State Legislature. In 1881 he was elected to the State Senate, serving four years, and then to the 49th, 50th, 51st 52d and 53d Congresses.

HEARD'S ISLAND, an island in the South Indian Ocean, extending between 53° 2' and 53° 14' S. lat., and between 73° 30' and 72° 30' E. lon. It is 30 miles long and 10 miles wide, and its highest point, Kaiser Wilhelm Peak, is about 6,000 feet high. The island was discovered by Captain Heard in 1853.

HEARING IN PRESENCE: in the law of Scotland, a hearing of a difficult or important case before the whole of the thirteen judges of the court of session. In England it is not in general competent for any court, when equally divided, to order a case to be argued before all the other courts sitting together.

HEARING OF A CAUSE, the phrase used in the court of chancery, when the merits of the case and the arguments on both sides have been entered upon.

HEARNE, a post-village of Robertson county, Texas, about 3 miles east of the Brazos River, at the junction of the Houston and Texas Central Railroad and the International and Great Northern Railroad. The car shops of the latter railroad are located here.

HEARSE, the carriage in which the dead are conveyed to the grave, but originally the term applied to a triangular bar or framework with upright spikes for holding candles at a church service, and especially at funeral services. It was originally very simple in form, but in the 15th and 16th centuries hearses or "horses" of great splendor

came into use, and were erected in the churches over the bodies of distinguished personages. From this the transition to the modern funeral hearse can be easily traced.

HEARST, GEORGE, a United States Senator, born in 1820, died Feb. 28, 1891. In 1865 he was elected to the California State Legislature, and in 1886 he became United States Senator to fill the vacancy caused by the death of John F. Miller. In 1887 he was again sent as a Democrat to the United States Senate to succeed A. P. Williams, Republican.

HEART'S CONTENT, a port of Newfoundland, beautifully situated on the S. E. side of Trinity Bay, in lat. 47° 50' N., lon. 53° 20' W. It is the landing-place of the Atlantic telegraph cables extending to Valentia, Ireland, and there are overland wires connecting with St. John's and Cape Ray. It has a fine telegraph building. Most of the inhabitants are engaged in fishing. Population, 900.

HEATH, WILLIAM, an American Revolutionary general, born at Roxbury, Mass., in 1737, died there June 24, 1814. He was active in organizing the militia before the Revolution; was a captain in the Suffolk regiment, of which he afterward became the colonel, joined the artillery company of Boston, and was chosen its commander in 1770. In 1774-75 he was a member of the Provincial Congress, and as provincial brigadier-general he performed valuable services in the pursuit of the British troops from Concord on April 19, 1775. He organized and trained the undisciplined forces at Cambridge before the battle of Bunker Hill. Upon the organization of the Continental Army he was commissioned a brigadier-general, and stationed at Roxbury with his command; and on Aug. 9, 1776, he was made a major-general in the Continental Army. In March, 1776, he opposed the evacuation of the city of New York. After the battle of White Plains he took command of the posts in the Highlands. In 1777, he had charge of the prisoners of Burgoyne's army at Cambridge. In June, 1779, he took charge of the posts on the Hudson with four regiments, and remained in that vicinity till the close of the war. After the war he returned to his farm, was a member of the convention that ratified the Federal Constitution, was a State Senator in 1791-92 and probate judge of Norfolk county in 1793. In 1798 he published *Memoirs of Major-General William Heath, containing Anecdotes and Details of Skirmishes, Battles, etc., during the American War*.

HEAVYSEGE, CHARLES, a Canadian poet, born in Yorkshire, England, in 1816. After receiving a limited education he became a wood carver, and emigrated to Montreal, Canada, in 1853. There he worked at his trade, but in his leisure hours he studied the Bible and Shakespeare. Frequently he contributed to the daily press, and acquired after awhile a reputation as a poet. After his first juvenile effort at poetry, *The Revolt of Tartarus*, and some 50 sonnets, he published *Saul*, a drama, in three parts, in 1857; *Count Filippo or the Unequal Marriage*, a drama in 5 acts; *Ode on Shakespeare*, and *Jephtha's Daughter* (1855). He died in 1876.

HEBREWS, EPISTLE TO THE. See *Britannica*, Vol. X, pp. 602-07.

HECATOMB: in the worship of the Greeks and in other ancient religions, a sacrifice of a large number of victims; properly, although by no means necessarily, one hundred. As early as the time of Homer it was usual only to burn the legs wrapped up in the fat and certain parts of the intestines, the rest of the victim being eaten at the festive meal after the sacrifice. In Athens the hecatomb was a most popular form of sacrifice,

while the Spartans limited the number of victims and sacrifices. In the hecatomb, strictly so called, the sacrifice was supposed to consist of one hundred bulls, but other animals were frequently substituted.

HECKER, FRIEDRICH KARL FRANZ, a German revolutionist, born at Eichtersheim, Baden, in 1811, died at St. Louis, Mo., March 24, 1881. He studied law at Heidelberg, and had afterwards a good law practice at Mannheim, but he entered politics. In 1842 he was elected to the chamber of deputies of Baden, and soon became a prominent member of the opposition. While visiting Berlin he was arrested and ordered out of the Prussian domain. This made him popular with the revolutionary class. In 1846-47 he was the leader of the extreme left in the Baden Diet. At Heidelberg he appeared in 1848 as a red-hot republican and socialist-democrat, and with the aid of Struve tried to unite the South-Germans in a revolutionary movement. Soon he placed himself at the head of columns of armed workmen, unfolded the banner of the social republic, and advanced into the southern (Black Forest) part of Baden. Gen. Siegel was the military leader. They were beaten by the Baden soldiery at Kandern, May 20, 1848, and had to retreat into Switzerland. In September of the same year Hecker emigrated to America, but was recalled by the provisional government erected in Baden in 1849. Before his arrival in Baden the new government had, however, collapsed, and Hecker returned at once to America, settling as a farmer near Belleville, Ill., and became a citizen of the United States.

In 1856 he was a prominent speaker in behalf of the Republican party. The first German Illinois regiment was raised by him in 1860. He served in Gen. Fremont's division as colonel of this regiment, and afterwards as brigadier-general under Gen. Howard. At the battle of Chancellorsville he was wounded. In March, 1864, he resigned, and retired to his farm. In the winters he often delivered popular lectures to German-Americans. During the Franco-German war he hoped that Germany would soon be ripe for a republic, but after visiting Germany in 1873 he felt disappointed by the actual political condition in Germany.

HECKER, ISAAC THOMAS, an American clergyman, the founder of the Paulists, born at New York in 1819, died in 1889. In 1843 he joined the Brook Farm Community, near Boston, where for nine months he baked the bread eaten by the members. After this he worked with his two brothers in the flour business, and gave the workmen frequent lectures. In 1845 he became a Roman Catholic; went to Germany to study for the priesthood; joined the Redemptorist fathers in Belgium in 1847, and was ordained priest in London in 1849 by Cardinal Wiseman. After being released from connection with the Redemptorists, he founded in 1858 the new congregation of the missionary priests of St. Paul (the Paulist fathers), having their principal house in New York city. The members take no vows, and any priest can leave the order when he chooses. They are nearly all Americans converted from Protestantism. Hecker established "The Catholic World," a monthly periodical, in 1855; wrote the *Questions of the Soul*; *Aspirations of Nature*, and a pamphlet on *Martin Luther* (1883); and many other papers.

HECKEWELDER, JOHN GOTTLIEB ERNST, an American Moravian missionary to the Indians, born at Bedford, England, in 1743, died at Bethlehem, Pa., Jan. 21, 1823. His father brought him to Pennsylvania in 1754, where he was afterwards apprenticed to a cooper. In 1762 he visited the Indian

tribes on the Ohio with Christian F. Post, a colonial Indian agent, and in 1771 he became a missionary to the Delaware Indians. In 1792 and 1793 he accompanied the United States commissioners sent to make treaties with several Indian tribes near the Great Lakes. After staying in Ohio for some years as postmaster, justice of the peace, and also of the court of common pleas, he retired to Bethlehem, Pa., where he studied the languages and customs of the Indians, especially the Delawares, and wrote a *History of the Indians of Pennsylvania* (1819); *Narrative of the Mission of the United Brethren Among the Delaware and Mohegan Indians* (1820); and a collection of *Names Which the Delaware Indians Gave to Rivers, Streams and Localities Within the States of Pennsylvania, New Jersey, Maryland and Virginia, With Their Significations* (1822).

HECKLES (Mid. Eng., *hekele*, from the Dutch *hekel*, *traak*, "a hook"), very important parts of various machines employed in the preparation of animal and vegetable fibers for spinning. They consist of a series of long metallic teeth, through which the material is drawn so that the fibers may be combed out straight and so fitted for the subsequent operations. Gills are heckles with finer teeth. *Heckling* is also now the received term for the rough and trying process of catechization to which Parliamentary candidates and members are subjected by their British constituencies.

HECTIC FEVER (Gr., *hektikos*, "habitual"), the name given to the fever which occurs in connection with certain wasting diseases of long duration. It is one of the most serious and constant symptoms of consumption, and seems to be directly related to the progressive emaciation which marks the course of that malady. In the morning the patient's temperature may be normal, but towards evening or after eating he grows hot and flushed, and there is a preternatural vividness of expression, which, with the heightened color, sometimes gives a very fallacious impression of health. The patient retires to bed, has uneasy sleep, and awakens in the middle of the night or towards early morning, bathed in cold perspiration, and in a state of extreme languor. The same exhausting cycle repeats itself day after day. The only radical way of treating the fever is to cure the disease on which it depends. When the symptom itself must be combated, a pill containing a grain of sulphate of quinine, with half a grain of digitalis and as much of Dover's powder, taken three times a day, is often serviceable.

HEDDING, ELIJAH, bishop in the Methodist Episcopal church, born at Pine Plains, N. Y., in 1780, died at Poughkeepsie, April 9, 1852. He became a Methodist in 1799, and was licensed to preach in 1800. He preached in Northern New York, Vermont and New Hampshire, enduring sometimes great hardships. In 1807 he was appointed presiding elder of New Hampshire district, and in 1808 was a delegate to the general conference at Baltimore. After 25 years of itinerant labors he was elected and ordained bishop, and for nearly 28 years longer served his church with great zeal. During his episcopate he lived mostly at Lynn, Mass., but in 1851 he removed to Poughkeepsie, N. Y. Hedding assisted in founding "Zion's Herald," the first Methodist Episcopal journal in the United States, subsequently merged in the "Christian Advocate." He was an eloquent preacher, forcible and convincing, yet pleasant and cheerful in private life.

HEDGE, FREDERICK HENRY, an American clergyman and author, was born at Cambridge, Mass., in 1805, died in 1890. In charge of George Bancroft he was educated in Germany. On his return to

America he studied theology at the Cambridge Divinity School, and in 1829 became pastor of the Unitarian church at West Cambridge. In 1835 he took charge of a church at Bangor, Me., and in 1850, after spending a year in Europe, he became pastor of the Westminster church at Providence, R. I., from which he removed to Brookline, Mass., in 1856. In 1858 Hedge became professor of ecclesiastical history in the theological department of Harvard College, and edited at the same time the "Christian Examiner." In 1872 he assumed the professorship of the German language in the same college. Besides many poems and frequent contributions to the "North American Review" and other periodicals, Dr. Hedge published *The Prose Writers of Germany* (1848); *Reason in Religion* (1865); *The Primeval World of Hebrew Tradition* (1870); *A Christian Liturgy for the Use of the Church*, etc. He also wrote hymns for the Unitarian church and published translations from the German poets.

HEDGE-MUSTARD (*Sisymbrium*), a genus of plants of the natural order *Cruciferae*, annual or rarely perennial herbs, with various foliage, small yellow or white flowers, and a long roundish or six-angled pod (*siliqua*). Several species are natives of Britain, of which one, the common hedge-mustard (*S. officinale*), was once employed in medicine. It is said to be diaphoretic and expectorant, and has a mild pungency. It is an annual plant, sometimes two feet high, branched, with renunciate or deeply-lobed leaves, stem and leaves hairy, flowers very small and yellow, and it is sometimes cultivated as a pot herb. The pods are erect and closely pressed to the stalk.

HEEN, CHOW, TING AND FOO, Chinese geographical terms used to designate the relative rank of cities and districts. Generally speaking, however, the terms designate the rank of cities, from *foo*, the chief, to *heen*, the least in size.

HEFELE, KARL JOSEPH, VON, German theologian, born at Unterkochen, in Württemberg, March 15, 1809. He studied at Tübingen, and in 1836 became privatdocent, and in 1840 professor of church history and Christian archaeology, in the Catholic theological faculty of that University. In 1869 he was made bishop. As a member of the Vatican council, he voted against Papal infallibility, but afterwards submitted. He became widely known as an eminent church historian through his *Apostolic Fathers* (1839); *Review of Wessenberg's Church Councils* (1841); *History of the Christian Councils* (1855-74); *Pope Honorius, Cardinal Ximenes* (1851); *Contributions to Church History*, and other works.

HEGESIPPUS, the earliest of the Christian church historians. Of his life we know nothing save that he was almost certainly a Jewish convert, and that he flourished about the middle of the 2d century. He must have written most of his history previous to A. D. 167, and probably published it early in the episcopate of Eleutherus. His work was entitled *Five Memorials of Ecclesiastical Affairs*, and appears not to have been a complete and continuous history, although extending from the death of Christ to the writer's own age. Unhappily it survives only in a few fragments which Eusebius had embodied in his own history, the most important of which are his account of the martyrdom of St. James and also of St. Simeon of Jerusalem.

HEIGHTS may be determined by four methods: by trigonometry, by leveling, by ascertaining and comparing the atmospheric pressure at top and bottom of the height by the barometer, or by ascertaining and comparing the boiling point of water at the top and bottom by the thermometer.

HEINSIUS, ANTHONY, a Dutch statesman, born at Delft, Dec. 22, 1641, died Aug. 13, 1720. He studied law at Leyden; in 1688 became grand pensionary of Holland, and as the close friend of William III (of England) guided Dutch politics till his death.

HEINTZELMAN, SAMUEL PETER, an American soldier, born at Manheim, Lancaster county, Pa., in 1805, died in 1880. He graduated at West Point in 1826; spent several years in border service as lieutenant, served during the Mexican war as captain, and was on the 9th of October, 1847, brevetted major for bravery. He then organized a battalion of recruits and convalescent soldiers at Vera Cruz, and marched them to the City of Mexico. After serving in California against the Indians and on the Rio Grande against Mexican marauders, he was brevetted lieutenant-colonel in May, 1861, for meritorious services, and was made inspector-general of the United States forces with headquarters at Washington. Afterwards he commanded a division of McDowell's army at the battle of Bull Run, and was wounded. In March, 1862, Heintzelman was in command of the third army corps; took an active part in the battles of Williamsburg and Fair Oaks; in the seven days' fighting around Richmond; in the second battle of Bull Run, and commanded the defenses of Washington. He was now major-general. After the war he served in New York harbor and Texas as colonel of the 17th infantry. In April, 1869, he was placed on the retired list with the rank of major-general.

HEIR AND EXECUTOR, a short phrase to denote that branch of the law in which a leading distinction is made between the two kinds of property left by a deceased person, real and personal. If real, it goes to the heir-at-law; if personal, it goes to the executors or administrators. In Scotland the same leading distinction exists under the head of heritable and movable, but in Scotland some things are classed among heritable which in England would not be classed among real property.

HEIR-APPARENT, in English law, means the person who is certain to succeed if he outlive his ancestor; thus the eldest son is so, because no other person can ever come between and obtain precedence.

HEISS, MICHAEL, born in Bavaria, on April 12, 1818; removed to the United States in 1842, and acted as a missionary priest in Wisconsin for several years. In 1868 he became bishop of La Crosse, Wis. In 1880 he was made coadjutor-bishop of Milwaukee, with right of succession, and in 1881 succeeded to the see. He was one of the most distinguished members of the Vatican Council of 1870. He died March 26, 1890.

HEL: in Norse mythology, the goddess of the dead and daughter of the evil-hearted Loki. The All-father hurled her down into Nifheim, and gave her authority over the lower world. She was of fierce aspect, and to her were assigned the characteristics of insatiable greed and pitilessness. After the diffusion of Christianity the ideas personified in Hel gradually merged, among the races of Scandinavian and German descent, in the local conception of a hell, or dark abode of the dead.

HELENA, a city and county-seat of Phillips county, Ark., situated on the Mississippi River and containing Southland College. Pop. (1890), 5,189.

HELENA, the capital of Montana and county-seat of Lewis and Clarke county, situated among foot-hills in the Prickly Pear valley, about fourteen miles from the Missouri River, and with the Rocky Mountains rising behind the city to the south. The Northern Pacific Railroad passes through Helena, and the city is connected with the Canada Pacific

and the Union Pacific roads, and by branch lines with several mining camps. Many of the streets are wide and straight, shaded with rows of cottonwood trees, and faced with handsome residences and business premises, and well lighted with gas and electricity. There are six street railways. A board of trade was organized in 1887. There are thirty-four graded schools, a high school and a number of private and parochial schools. Montana University, opened in 1890, is located outside the city. Charitable institutions are numerous, industries of nearly every type are pursued, and nearly all religious denominations are represented by the churches of the city. Gold was found here in 1864, and the camp was known as Last Chance Gulch until December of that year, when it received its present name. Population in 1890, 13,834. See *Britannica*, Vol. XVI, p. 774.

HELIACAL RISING (from Gr. *helios*, "the sun"). A star is said to rise heliacally when it rises just before the sun. When the sun approaches a star which is near the ecliptic, the star becomes for a time invisible; the heavens being too bright in the quarters of sunrise and sunset, at the times of its rising and setting, to allow it to be seen. But when the sun, progressing in its orbit, separates from the star, and the latter begins to rise first, it in time rises so much earlier than the sun as just to be visible before daylight. It is then said to rise heliacally.

HELICIDÆ (Gr. *helix*, "a spiral"), a large family of terrestrial air-breathing (pulmonate) gastropods, of which snails are familiar examples.

HELGOLAND ("Holy Land"), an island 36 miles north of the Elbe mouth (see *Britannica*, Vol. XI, p. 630). It consists of a rock 200 feet high, on which are a village and a light-house. It is the resort of bathers from Hamburg. During 1890 the announcement of its proposed transference, under the terms of the Anglo-German agreement respecting Africa, from British to German rule, came as a complete surprise upon the public of both countries, and various opinions were speedily elicited as to the propriety of the step contemplated. In England the value of the island as a naval station was strongly insisted upon; it was declared that the Heligolanders themselves were bitterly averse to the change, and Lord Salisbury was loudly reproached in some quarters for not having ascertained more carefully their views upon the subject. The protests, however, proved unavailing, and on August 9 the island was formally handed over to Germany, the ceremony being followed by the visit of the German emperor on the next day, when a proclamation was read in which his majesty promised the utmost care for the rights and wishes of the islanders, and announced that all living males would be exempt from compulsory military and naval service, to which they have a remarkable abhorrence. The revenue of the island in 1888 was slightly over \$40,000, and the expenditure over \$35,000.

HELLER, STEPHEN, German pianist and musical composer, born at Pesth, May 15, 1814, died at Paris Jan. 14, 1888. He made his debut as a pianist when only nine years of age, and before he was sixteen had played in many of the principal cities of Europe. In 1830, he settled in Augsburg, and began the study of composition. In 1838 he removed to Paris, where he occupied himself with composing and teaching until his death. His works are distinguished by originality and refinement.

HELIOCENTRIC: in astronomy, having the sun (Gr. *helios*) as center of reference; the heliocentric place of a planet being opposed to its geocentric (Gr. *gē* "earth"), its place as seen from the earth.

HELL GATE, named by the Dutch settlers of New York *Helle Gat*, is a pass in the East River, between New York City and Long Island, formerly very dangerous to vessels from its numerous rocks and its rapid currents. These rocks and reefs were in mid-channel, and projected also from several small rocky islands. The largest were known as the Gridiron, Flood Rock, Hen and Chickens, Negro Head, Bread and Cheese, Hallett's Point, Way's Reef, Pot Rock, Frying Pan, Middle Reef, etc. In 1851 attempts were made to blast away the obstructions, and in these operations Maillefert's process of surface-blasting was employed. This consisted in placing charges of gunpowder, usually 125 pounds, on the surface of a rock and exploding the powder by means of an electric current. The rocks thus operated upon were Pot Rock, Frying Pan, Way's Reef, Bald-headed Billy, Shelldrake Rock, and Diamond Reef. On all of them the depth of the water was increased, in some cases only 2 feet, and in others as much as 10 feet. These improvements consumed over 74,000 pounds of gunpowder, and cost about \$14,000. The money was furnished by New York City. In these operations the broken material was not dredged or otherwise cleared away.

The depths obtained were not sufficient for first-class vessels. Besides, a number of other obstructions remained in the channel. The U. S. Government, therefore, appropriated \$20,000 in 1852; and Major Frazer, U. S. E., continued the surface-blasting on Pot Rock in the same year, thereby increasing the depth of the water over this rock from 18 to 20 feet. By this time it was deemed necessary to adopt other methods of working. Drilling under water through diving-bells was impossible, because the current runs too fast and the space was too small. The question arose, How can this work be done successfully? No satisfactory plan was devised until 1866, when Gen. John Newton, U. S. E., proposed drilling from a fixed platform through tubes reaching to the surface of the rocks. Congress made now sufficient appropriations for the work.

In 1869 Newton used a floating scow having a central opening of 32 feet diameter, through which a large hemispherical iron bell, open both at top and bottom, was lowered to the rock below. This dome-like caisson, made of boiler iron, afforded a frame-work for supporting 21 drill tubes. Drills weighing from 600 to 900 pounds worked through these tubes. The bell had legs which could be let out or drawn in to fit the rock. Cams were used to hold the legs in place. After the drilling was completed the drill-holes were filled by a diver, who inserted charges of nitro-glycerine and made the electrical connections with the fuses. After this the scow was floated away and the blasts fired. The broken rock was removed by means of a steam grapple.

In 1871 Newton used a steam-drilling scow on the Diamond Reef. He now drilled holes from 7 to 13 feet deep and 4 inches in diameter. He fired them with charges of from 30 to 55 pounds of nitro-glycerine. In 1871 he operated in like manner on Coenties Reef; in 1872 on the Frying Pan and Pot Rock. In that year the scow was struck 16 times by colliding vessels, and four of the latter were sunk by it. One vessel was drawn under the scow and carried off its dome; but the dome was afterwards recovered in a damaged condition. In 1874 Newton reduced Way's Reef from 17 feet to a depth of 26 feet.

The most difficult problem was the removal of the reef at Hallett's Point. To accomplish this he sank a large shaft on shore in 1869. From this

shaft 41 radial and 11 concentric galleries of various cross-sections were driven under the reef. The length of all these galleries together amounted to nearly $1\frac{1}{2}$ miles. Diamond drills, Ingersoll drills, Burleigh drills and hammer drills were all used in this work. The excavations were completed in June, 1876. Then holes were drilled in piers and roofs for the charges. From Sept. 11, 1876, till the 20th of the same month was occupied by charging the holes. Twenty-three distinct galvanic batteries, aggregating 960 cells of zinc and carbon, were arranged to fire 160 fuses each; 3,680 mines were connected in continuous series with a lead and return wire, so that the circuits of all could be closed with one circuit-closer—i. e., by pressing down a button. After everything was ready the mines were tamped by water run in through a syphon; and on Sunday, Sept. 24, 1876, they were fired at 2.50 p. m. without any hurtful shocks to surrounding objects. The water was thrown up to a height of 123 feet. The total expense of this blast was \$81,092.

Flood Rock, situated in mid-channel, was still projecting above water, and constituted a dangerous reef. Work tending to its removal began June, 1875, by sinking a shaft 10 feet by 20 feet down through the rock. During the following year the mine was filled with water. Want of appropriations caused several suspensions, which added considerably to the cost of the work, in consequence of the pumping required to free the mine from the water flowing into it by some large seams. In 1874 the undermined area covered 9 acres. The total length of the galleries, 10 feet square, was 21,670 feet. The drill-holes for breaking up the roof and columns amounted to a total length of 113,000 feet, or over 20 miles. For charging the drill-holes cartridges 2 feet long were inserted and held in place by 4 small wire legs. These cartridges were filled with "rackarock," a mixture of 79 per cent. of finely ground chlorate of potash with 21 per cent. of dinitro-benzole. After filling the drill-holes with several rackarock cartridges, a dynamite cartridge, 15 inches long, with a fulminate of mercury exploder, was inserted. The mine was fired by primary charges of dynamite placed at intervals of 25 feet along the galleries, lashed to some timbers. Their explosion produced a concussion strong enough to ignite the fulminate primers in the charges of rackarock. By this "sympathetic" method the entire mine, containing over 120 tons of rackarock and 42,000 pounds of dynamite, was simultaneously exploded, on Oct. 10, 1884. The battery contained 60 bichromate cells connected together in series. When the electric contact was made a dull thud was heard, the earth shook for a considerable distance, and an immense mass of water was thrown some 200 feet up into the air. But no damage was done except the breaking of a few dozen panes of glass and shaking down some loose brick and plaster in Astoria. No severe shock was felt anywhere. Yet the entire roof of the mine was shattered, and about 500,000 tons of rock were loosened. The total expense of this blast was \$106,509.

Immediately after this explosion dredging was commenced with the Government scow, but in October, 1885, a contract was let for the removal of 30,000 tons of loosened rock, and afterwards other similar contracts were let. About 120 tons were removed daily for a considerable time. But there are some of the rocky obstructions yet to be removed, inasmuch as the mean low-water depth is not quite 26 feet over the Diamond Reef, Coenties Reef, a reef near the North Brother's Island, and the Pilgrim Rock, which have been included in

the projected improvements. Both the main and Eastern channels, however, now afford passages wide and deep enough for the largest vessels.

HELMET-SHELL, the shell of a mollusk belonging to the genus *Cassia*, a thick, heavy shell, with bold ridges, a short spire, and a long aperture, the outer lip toothed, the canal recurved. There are numerous species, most of them found in tropical seas, some in the Mediterranean. The shells are made up of differently colored layers, and are much used for the manufacture of cameos.

HELMHOLTZ, HERMANN LUDWIG, a distinguished German physiologist and natural philosopher, was born in 1821, at Potsdam, Prussia. After studying medicine in the Military Institute at Berlin, and being attached for a time to the staff of one of the public hospitals there, he returned to his native town as an army surgeon. In 1848 he was appointed professor of anatomy in the Academy of Fine Arts at Berlin; in 1855 professor of physiology at Königsberg, whence he removed, in 1858, to Heidelberg, where he also filled the chair of physiology. He was afterwards appointed professor of physiology at Berlin. The works of Professor Helmholtz, which are well known throughout Europe, have reference principally to the physiological conditions of the impressions on the senses. Among those most deserving of notice are: *On the Preservation of Force*, 1847; *Manual of Physiological Optics*, 1856; and *Theory of the Impressions of Sound*, 1862. His *Popular Lectures on Scientific Subjects*, were published in London in 1873, and his work on *Sensations of Tone*, as a *Physiological Basis for the Theory of Music*, appeared in 1875. Professor Helmholtz has also contributed to scientific journals accounts of many of his experiments in acoustics, optics, and electricity. On December 1, 1873, the Copley medal of the Royal Society of London was awarded to him in recognition of his eminent services to science.

HELPER, HINTON ROWAN, born in North Carolina, December 27, 1829; became consul for the United States to the Argentine Republic in 1861, which office he held for six years. His chief title to fame is as the author of a book called the *Impending Crisis of the South*, which, on its publication in 1857, attracted great attention.

HEMIBRANCHII, an order of teleocephalous fishes, having the palatine bone directly articulated with the quadrate, imperfect branchial arches, and a peculiar structure of the shoulder-girdle. Six families are referred to this order: the *Gasterosteidae* or sticklebacks, *Fistulariidae* or pipe-fishes, *Aulorhynchidae*, *Aulostomidae*, *Centriscidae* and *Amphisiilidae*.

HEMITRIPTERIDÆ, a family of acanthopterygian fishes, represented by the genus *Hemitripterus*. It includes *Coltoidea* having numerous vertebrae (16 abdominal plus 23 caudal), an elongated spinous dorsal fin, imperfect ventrals enveloped in a thick skin, and inflated head with prominent orbits. The family is represented on the coasts of the United States by a species known as the deep-water sculpin, *Hemitripterus Acadicus*.

HEMLOCK, or HEMLOCK SPRUCE. See FIR, Vol. IX, pp. 222-25.

HEMPHILL, JOHN J., a United States Congressman, born in 1849. He was admitted to the South Carolina bar in 1870. In 1876 he was elected as a Democrat to the legislature, and reelected in 1878 and 1880. He was a member of the 48th, 49th, 50th and 51st Congresses.

HEMPSTEAD, a village of Queens county, N. Y., in Hempstead township, situated on the Long Island Railroad, 21 miles east of New York City. It has Hempstead Institute, public halls, a seminary, and many fine residences. The township of Hemp-

stead is bounded on the south by the Atlantic Ocean, and includes Rockaway, a fashionable bathing place. Population in 1890, 23,517.

HEMPSTEAD, a railroad junction and county-seat of Waller county, Texas. It has a cotton factory and manufactures cotton-seed oil.

HENDECAGON, or ENDECAGON: in geometry, a plane figure of eleven sides and as many angles. The area of a regular or equilateral endecagon is very nearly equal to 9.36564 times that of the square of one of its sides.

HENDERSON, a railroad junction and county-seat of Vance county, N. C. Its principal industry is connected with tobacco.

HENDERSON, the county-seat of Henderson county, Ky., on the Ohio River, 212 miles southwest of Louisville. It has car works, wagon and carriage factories. Pop. (1890), 8,835.

HENDERSON, the county-seat of Rush county, Texas. It is the seat of Henderson College.

HENDERSON, DAVID BREMNER, a United States Congressman, born in 1840. He was admitted to the Iowa bar in 1865. In 1861 he enlisted in the Union army, and served until discharged in 1863, owing to the loss of his leg. He reentered the army the following year as colonel, and served until 1865, when he became collector of internal revenue for the third district of Iowa. He resigned in 1869, and became assistant United States district attorney for the northern division of the district of Iowa, and served two years. He was chosen as a Republican to the 48th, 49th, 50th, 51st, 52d and 53d Congresses.

HENDERSON, JAMES PINCKNEY, an American soldier and statesman, born in Lincoln county, N. C., in 1808, died in Washington, D. C., June 4, 1858. After studying law he moved to Mississippi in 1835, and practiced law there until the Texas troubles began. He volunteered in the Texan army, and was appointed brigadier-general in 1836. When the army was disbanded, President Houston appointed Henderson attorney-general of Texas. Subsequently he was secretary of State. In 1839 he was sent to England and France in order to procure the recognition of Texan independence. In 1844 he was special minister to the United States to negotiate the annexation of Texas. In 1846 Henderson was a member of the State constitutional convention, and when the constitution was ratified he was elected governor of Texas. In the Mexican war he took command of the Texan corps of volunteers, distinguished himself at Monterey, and received afterwards the thanks of Congress and a sword for bravery in action. In 1857 he was chosen a United States Senator, and took his seat in March, 1858.

HENDERSON, JOHN STEELE, a U. S. Congressman, born in 1846. He entered the Confederate army in 1864, and served through the war. In 1876 he was a member of the North Carolina Legislature, and of the State Senate in 1878. In 1881 he was elected one of three commissioners to codify the statute laws of the State, and in 1884 became presiding justice of the inferior court of Rowan county. He was elected as a Democrat to the 49th, 50th, 51st, 52d and 53d Congresses.

HENDERSON, THOMAS J., a United States Congressman, born in 1824. In 1852 he was admitted to the Illinois bar, and was a member of the Legislature in 1855 and 1856, and of the State Senate in 1857, 1858, 1859 and 1860. In 1862 he entered the Union army, and served till the close of the war, receiving the brevet of brigadier-general. He was a Republican member of consecutive Congresses from the 44th to the 53d, both inclusive.

HENDRICKS, THOMAS ANDREWS, an American statesman, born near Zanesville, Ohio, in 1819,

died suddenly at Indianapolis, Nov. 25, 1885. He graduated at South Hanover College, Ind., in 1841, studied law at Chambersburg, Pa., and was admitted to the bar there in 1843. He afterwards practiced law at Shelbyville, Ind., very successfully. In 1850 he was elected to the State convention to revise the constitution of Indiana. From 1851 to 1855 he was a member of Congress, after which President Pierce appointed him commissioner of the U. S. general land office. In 1863 Mr. Hendricks was elected to the U. S. Senate from Indiana, and was one of the leaders on the Democratic side. In 1872 he became governor of Indiana. After the expiration of his term, Mr. Hendricks continued to practice law at Indianapolis until 1884, when, after the nomination of Grover Cleveland for President at the Chicago convention, he was unanimously nominated for Vice-President, and in November was elected. He was an effective public speaker and an earnest Democrat.

HENLE, FRIDERICH GUSTAV JAKOB, born at Fürth, Bavaria, July 9, 1809, died May 18, 1885. He graduated M.D. at Bonn in 1832; was for a time assistant in the anatomical museum at Berlin, became professor of anatomy at Zürich 1840-44, at Heidelberg 1844-52, and in the latter year accepted a similar professorship at Göttingen. Among his works are: *Ueber Schleim und Eiterbildung* (1838); *Vergleichende Anatomie des Kehlkopfes* (1839); *Pathologische Untersuchungen* (1840); *Handbuch der allgemeinen Anatomie* (1841); *Handbuch der rationalen Pathologie*, and *Handbuch der Systematischen Anatomie*.

HENNEPIN, the county-seat of Putnam county, Ill. It is connected with Chicago by the Illinois River and the Michigan and Illinois canal, and is 114 miles southwest of that city. It contains a flour mill and a planing-mill.

HENNEPIN, LOUIS, a French explorer of America, born at Ath, Belgium, in 1640, died in Holland in 1702. He entered the order of Recollets of St. Francis, and was employed by his brethren to solicit alms at different places—among others at Dunkirk and Calais, where the stories related by the sailors stimulated his desire to visit foreign countries. Afterwards he traveled in Germany and Italy, and was regimental chaplain at the battle of Seneffe, between the Prince of Condé and William of Orange. In 1673 he was ordered to Canada, where he preached for some time at Quebec, and founded a convent at Fort Frontenac. Father Hennepin went first to Niagara with La Salle's expedition (see *Britannica*, Vol. XIV, pp. 318, 319), and took part in navigating Lakes Erie, Huron, and Michigan as far as Mackinaw. Then they sailed down to the Illinois River as far as Peoria, where La Salle built Fort Crèvecoeur. Thence Hennepin set out with two men in a canoe in 1680, descended the Illinois to its mouth, and, after sailing up the Mississippi River for some weeks, fell into the hands of a large party of Sioux Indians, who carried him and his men to their country. Here he discovered and named the Falls of St. Anthony. He spent eight months among the savages. Then Daniel Greysolon de Luht, who had come by way of Lake Superior, rescued him, and enabled him to reach Green Bay by way of the Wisconsin River. Hennepin returned to Quebec in April, 1682, and soon afterwards returned to France, where he published his *Description de la Louisiane, nouvellement Découverte au Sudouest de la Nouvelle France* (1683). He was appointed guardian of the convent of Renty, in Artois, but he soon withdrew to Holland. After laying aside his religious dress he lived in England, where he pub-

lished his *New Discovery of a Vast Country in America* (1698). His last work is *Nouveau Voyage dans un Pays plus Grand que l'Europe entre la Mer Glaciale et le Nouveau Mexique* (1698).

HENNINGSSEN, CHARLES FREDERICK, an English soldier and author, born in England of Swedish parents in 1815. He joined the Carlist army in Spain in 1834, and became colonel of cavalry after the battle of Vielas de los Nevarros. He was afterwards taken prisoner and released on parole. Then he served in the Russian army in Circassia, and afterward joined Kossuth in the Hungarian revolution, becoming commander of the fortress Comorn. Coming to America in Kossuth's interest, he joined in 1856 William Walker in Nicaragua, where he was given command of the artillery. He distinguished himself by his defense of Granada and in the victory of Quesesma. After Walker's surrender to Com. Davis, U. S. N., in 1857, Henningsen returned to the United States. At the outbreak of the civil war he entered the Confederate army as colonel, but was soon afterwards made brigadier-general. He was an able artilleryman. Henningsen published: *Revelations of Russia* (1845); *The White Slave*, a novel; *Eastern Europe*; *Sixty Hours Hence*, a novel of Russian life; *Past and Future of Hungary*; *Personal Recollections of Nicaragua*; and various other works, mostly issued in London. He died in 1877.

HENRY, a village of Marshall county, Ill., situated on the Illinois River and on a railroad, 120 miles south of Chicago. A combined wood and iron bridge spans the river at this point, and here is a lock and dam of the Illinois River Improvement. The village contains a paper mill, a wagon factory, and Marshall College. Pop. (1890), 1,512.

HENRY, CALEB SPRAGUE, an American clergyman and author, born at Rutland, Mass., in 1804. He studied theology at Andover and New Haven, and was ordained as a Congregational minister in January, 1829. He first became pastor at Greenfield, Mass., and then in West Hartford, Conn. In 1835 he took deacon's orders in the Protestant Episcopal church, and was ordained priest in 1836. From 1835-38 he was professor of intellectual and moral philosophy in British College, Pa., and from 1839 to 1852 professor of philosophy and history in the New York University. For some time he also performed the duty of chancellor. He was also rector of St. Clement's church, New York, from 1847 to 1850. During that period he edited the "Churchman," and was also for a year the political editor of the New York "Times." Before this he had founded the "American Advocate of Peace," which soon became the organ of the American Peace Society; also the New York "Review," which he conducted till 1840. Among his many published works we mention: *Cousin's Psychology* (1834), translated from the French; *Compendium of Christian Antiquities*; *Moral and Philosophical Essays*; *Guizot's History of Civilization*, with notes; *Ancient and Modern History*, revised; *Epitome of the History of Philosophy*; *Dr. Oldham at Greystones and His Talk There*; *Social Welfare and Human Progress*; and *Satan As a Moral Philosopher*. He died in 1884.

HENSON, JOSIAH, an American clergyman, born at Port Tobacco, Charles county, Md., in 1787, died in Dresden, Ontario, in 1881. He was a negro, and was born and bred as a slave. Mrs. Harriet Beecher Stowe took his life as the foundation of her novel entitled *Uncle Tom's Cabin*. His arms were crippled as the result of blows from a Maryland overseer. Although he paid \$500 toward purchasing his freedom, yet his master's son took him to New Orleans to be sold. The latter was attacked with yellow fever, and the slave accompanied him back

to Kentucky and nursed him through his sickness. He finally escaped with his wife to Canada, carrying his two children through swamps and thick forests. "Uncle Si," as he was called, settled on Sydenham River near the present town of Dresden and prospered as a farmer. He was also the pastor of a church. When 52 years old he began to read and write. In 1858 he wrote and published an Autobiography. He went three times to England, lecturing and preaching in various cities, and was in 1876 entertained by Queen Victoria at Windsor Castle.

HEPATITIS (Gr. *hepar*, "the liver"), inflammation of the liver.

HEPPENHEIM, an old walled town of Hesse, situated on the Main-Neckar Railway, 16 miles from Darmstadt. It is noted for the excellent wine produced in the vicinity, and for the ruins of the castle of Starkenburg. Population, 5,000.

HEPTAGON, a plane figure of seven sides and seven angles; when the sides and angles are equal the figure is a *regular heptagon*. Geometers have hitherto failed to discover a method of inscribing the heptagon in or of circumscribing it about a circle, and the problem is believed by many to be impossible of solution by the ancient geometry.

HERBARIUM. See *Britannica*, Vol. XI, pp. 715-718.

HERBERT, HILARY A., a United States Congressman, born in 1834. He was admitted to the Alabama bar, and then served in the Confederate army until 1864. He was elected as a Democrat to consecutive Congresses from the 45th to the 52d. In 1893 he became Secretary of the Navy.

HERBERT, SYDNEY, Lord **HERBERT**, of Lea, English statesman, born at Richmond, Sept. 16, 1810, died Aug. 2, 1861. Educated at Harrow and at Oriel College, Oxford, he entered the House of Commons as member for South Wilts, which he represented until his elevation to the peerage in 1861. He was secretary to the admiralty 1841-45, secretary for war 1845-46, 1852-55, and in 1859. He was an able and popular Conservative leader, his army administration being signalized by great improvements in the sanitary condition and education of the army, the amalgamation of the Indian with the royal army, and the organization of the volunteer force. In 1861 he was called to the Upper House under the title of Baron Herbert of Lea. He was heir-presumptive to the 12th earl of Pembroke, and his son became 13th earl in 1862.

HERCULES BEETLE (*Dynastes hercules*), a gigantic lamellicorn beetle from tropical America. The male bears on the thorax an enormous horn, which is met by a shorter upturned horn from the head. The female is without horns, and decidedly smaller. Another species, *D. titigus*, about two inches in length, occurs in the United States. The genus *Megasoma* is nearly allied to *Dynastes*.

HERCULES, PILLARS OF, the name given by the ancients to Calpe (now Gibraltar), and Abyla (now Ceuta), two rocky promontories forming the entrance to the Mediterranean Sea. According to the fable, they were originally one rock, but were torn asunder by Hercules.

HERD-BOOK, a book of record containing the list of pedigrees of cattle of choice breeds.

HEREDITAMENTS, any species of property that may be inherited. See *COPYRIGHT*, *Britannica*, Vol. VI, pp. 256-68; *PERSONAL ESTATE*, Vol. XVIII, pp. 664-65; *REAL ESTATE*, Vol. XX, pp. 304-08; *TITHES*, Vol. XXIII, pp. 410-13.

HEREDITARY RIGHT: strictly speaking, the right of succession, as an heir-at-law. The foundation of this right is nothing but convenience, the principle being that if a man does not by will ap-

point his own heir, the law will do it for him, proceeding according to certain degrees of relationship.

HEREDITY, the general resemblance of children or young animals to one or both of their parents. In some cases this likeness is very close, so that, but for the difference in age, the offspring could scarcely be distinguished from the parent it resembles most. With children this likeness is, however, much less close than with animals. The most generally observed heredity in man is the resemblance in the external structure, comprising the size and shape of the body, the features, complexion, obesity or leanness, and other minor peculiarities. Among the latter may be mentioned the anomaly of six fingers and six toes, which has often been transmitted through several generations; of unusually long canine teeth, etc.

As to the internal structure, we find that the proportions of the bones and the organs of the body are transmissible characteristics. In some families the heart and the main blood-vessels are very large, while they are small in others. Some families are more full-blooded than others. In some the nervous and muscular systems are more developed than in others, and this greater or smaller development runs through many generations. In consequence of this we find certain diseases hereditary in some families, while others are free from them; many families are constitutionally weak in certain organs or tissues, while others are strong. Greater or less fecundity, longevity, immunity from infectious diseases, keenness of sight, hearing, or smell, personal idiosyncrasies, powers of voice, etc., are all transmissible characteristics. There are also on record many cases of the inheritance of special habits, graceful movements, bodily activity, and great muscular strength.

In regard to the intellectual and moral qualities the instances of heredity are too evident and well known to be dwelt upon here. Children resemble their parents very frequently in their passions, propensities, likings or dislikings, in their pride or humility, in their capability and love for music, painting, acting, dancing, etc. The same may be said of their literary or scientific tendency; of their logical, mathematical, and poetical or practical tendencies.

There are also cases on record where lunacy was transmitted through many generations; the tendency to commit suicide has been traced through four generations; and the alcohol habit has been transmitted through entire communities for centuries. Distinctive characteristics—mental as well as bodily ones—of isolated peoples, as the Gypsies, Jews, Chinese, are transmitted through entire nations for thousands of years.

This persistent inheritance of peculiarities cannot be the result of chance. It is altogether too general for that. We find it most strikingly exhibited in the instincts of the lower animals. Ants, bees, beavers, birds, etc., will now build their habitations exactly the same as ants, bees, beavers, birds, etc., built theirs thousands of years ago. The habits, modes of living and the methods of attacking their enemies, or of self-defense, etc., remain forever the same in the same genus of animals. We must, therefore, conclude that heredity is a law of nature.

As to particular phases of heredity, it is impossible that a child should resemble both parents if they are unlike. It will resemble one or the other, or else be intermediate between them in form and character. In most cases it strongly deviates towards one of the parents, and shows a less marked influence of the other. We find that the character-

istics of the father sometimes descend to the son, at other times to the daughter. So the characteristics of the mother reappear as often in her sons as in her daughters. In other, but rarer cases, children resemble one of their grandparents, or even some remoter ancestor. This indirect heredity is called "atavism." There are cases on record where characters have appeared that are traceable to some very remote ancestor. Resemblance to an uncle or aunt occurs once in a long while also. We call this collateral atavism.

When a child is intermediate between its two unlike parents, yet shows the influence of both, this is no exception to the law of heredity, but a proof of it. Sometimes it is very difficult to trace this or that particular characteristic of the child to either of the parents, and then we speak of exceptions to heredity with more justification. These exceptions are apparently as numerous as the accordances. They are partly due to the combined influence of both parents upon the child, since a compound of two unlike elements must necessarily differ from either of the elements. The offspring of two markedly different parents, if it is strongly individualized, cannot resemble either. If the two parents are too greatly unlike in organization, descent, or color, the offspring will very likely be an infertile hybrid. And if they are too much alike in organization and descent, as branches of the same family sometimes are, then the offspring will be defective in some of the mental faculties or in some bodily development. Too much similarity of the parents causes partial arrest of development.

The other general cause of heterogeneity is the acquirement of new habits and mental tendencies during the life of the individual parent. Such newly-gained characteristics are often transmissible, and may produce in the children marked deviations from the general family characteristics. The future parent, even while an embryo in its mother's womb, may be subject to disturbing influences which produce changes even in its structural organization. Many instances are on record where the uterine development of an embryo has been warped so as to produce permanent changes from the family type. Later on we observe individual variations produced by physical and mental influences acting upon the body or mind of a person during his adolescence. These variations are quite marked—much more so than those produced during the maturity of the person.

There are other causes of individual variations and deviations from the family resemblance—causes which act upon the germinal cells of both parents even before the procreation of the offspring. These warping causes are and will remain a mystery. We know only their effects. Thus we find good-sized parents begetting dwarfs, medium-sized parents begetting children who grow into giants, parents of very ordinary intellects begetting children who develop great genius; but in no instance can abnormally great mental powers be traced for more than two or three generations. The descendants of great thinkers and great actors in the world's theater generally return easily to the common plane. The all-powerful influence of heredity makes itself felt in this return to the average condition of mankind. Individuals are incessantly diverging from the normal condition of body or mind, and they often make a lasting mark in history, yet the force of heredity acts in such a way as to straighten out such divergences. Divergent individuals are ever isolated and ephemeral. But their peculiarities may be sustained by close breeding, as it is practiced with domesticated animals,

as horses, cattle, dogs, pigeons, etc. The same thing takes place where peoples are strictly separated into castes or classes; where the members of the nobility, for instance, are not allowed to intermarry with those of the bourgeois or peasant class, the former become gradually thinned out, and physically and mentally degenerated.

National differences in physical and mental characters do not oppose the law of heredity. They are mostly due to the influence of circumstances on individual persons, families and communities, such as climate, food, education, occupation, etc. These influences produce transmissible characteristics, which, by their accumulation through centuries, constitute a new national character or type.

The physical and mental characters of nations are therefore very different. In ancient times a Greek was mentally as different from a Roman as a modern Yankee is now different from a Briton. The physical characteristics of races are very persistent, because heredity acts more vigorously upon the body than upon the mind. A child receives his body complete from his parents, but with respect to his mind he receives only a germ; an undeveloped faculty of thinking and willing. This faculty is very plastic. He must mold it himself and gather his mental stores himself. Yet the germinal mental tendencies are very tenacious, and yield but slowly to transforming influences. The child of a savage can, therefore, not attain the intellectual superiority of a Shakespeare or a Goethe; neither can the average child of a Mongolian, Papuan or Negro attain the intellectual development of an average Caucasian. Heredity is, therefore, an all-pervading agency or force in organic nature, that has produced the racial, national, and family characteristics, but it is counteracted by several opposing agencies which produce divergences from the general types, varieties, species, genera, and individual changes and modifications. While heredity instills an inherent tendency to repeat the characteristics of the parent, these opposing agencies tend to produce characteristics in the offspring not existent in either parent. Heredity alone would produce homogeneity, a tiresome sameness; while the opposing agencies differentiate the general types, and thus produce heterogeneity.

HERING, CONSTANTINE, a German physician, born at Oschatz, Saxony, in 1800, died at Philadelphia, July 23, 1880. Having studied medicine and graduated as M. D., he was engaged in writing a book confuting homeopathy. He read Hahnemann's works, became a convert, and, after personal acquaintance with Hahnemann his admiring friend. The king of Saxony sent him to Surinam to study the flora and fauna of that country. In 1833 he arrived at Philadelphia, where he founded the first homeopathic school in this country. From 1845 to 1869 he filled the chairs of homeopathic materia medica and medicine in this school. He edited several homeopathic papers, as the "Homeopathic Quarterly," the "Homeopathic News," and the "American Journal of Homeopathic Materia Medica." He published many books in both English and German on his favorite doctrine, as the *Rise and Progress of Homeopathy*, *Effects of Snake Poison*, *Condensed Materia Medica*, *Hering's Domestic Physician*, and *American Drug Proving*.

HERITABLE AND MOVABLE, a Scotch lawphrase denoting the distinction of things which go to the heirs and to the executors respectively. Movable include such property as passes to the executor in succession, or is movable by the tenant on leaving his farm, or as comes under the oper-

ation of the law of the owner's domicile in bankruptcy and succession. Money and household furniture may be taken as examples. Heritable subjects are such as go to the heir in succession, or go with land to a buyer, and are regulated by the territorial law. The best examples are land and houses. The gearing of engines and all machinery fixed to the floor are also heritable. Heritable bond, in Scotch law, is a personal bond for a sum of money, with a real right of annual rent payable out of land, and accompanied by a conveyance of the lands themselves in security. The usual deed is now a bond and disposition in security, corresponding to the English mortgage. Heritable securities is the name given, in the law of Scotland, to what in England are called mortgages and charges on land. By the constitution of a heritable security, the debt secured becomes a burden on the land, entitling the creditor to appropriate the rents until the debt is paid. This right of the creditor remains entire against the land, no matter into whose hands it passes. In Scotland the principal heritable security is called the bond and disposition in security, which consists of an obligation to pay the debt, and a disposition to the creditor by way of security till the debt is paid. Power is given to the creditor to sell the estate if the principal or interest is not paid, in which case the creditor must account for the surplus after paying himself the debt.

HERITOR: in the law of Scotland, the owner of land in a parish liable to public burdens. The heritors, collectively, have vested in them the fee of the church and churchyard; they repair the parish church and manse, or rebuild them where necessary.

HERKIMER, the county-seat and a railroad junction of Herkimer, N. Y. It is a thriving village, and has good schools, a flour mill, and a paper mill. Pop. (1890), 3,508.

HERKIMER, NICHOLAS (c. 1725-1777), an American Revolutionary soldier. In 1758 he became lieutenant of militia, and commanded Fort Herkimer, on the Mohawk, during the attack of the French and Indians in that year. In 1775 he became colonel and chairman of the committee of safety of Tryon county, N. Y. A year later he was made brigadier-general in the New York militia. When Colonel St. Leger, sent out by General Burgoyne, besieged Fort Schuyler (now Rome, N. Y.), Herkimer marched to its relief with 800 militia. He proceeded cautiously at first, but his younger officers urged him to proceed more rapidly. As they advanced through a wooded ravine near Oriskany, the British regulars attacked him in front and the Indians on both sides, Aug. 6, 1777. He was soon wounded, but continued to direct the fight for five hours longer. A sortie from Fort Schuyler relieved his men after a loss of 200. He died from the effects of the amputation of his leg. Congress and New York united in erecting a monument to his memory in 1884.

HERKOMER, HUBERT, an English painter, born in 1849. In 1869 he exhibited two pictures in the Dudley gallery, and his success was immediate. His two most popular oil-paintings are *Chelsea Pensioners*, and the companion piece, *Eventide*, the latter showing a group of old women at the work-house.

HERMANN, the county-seat of Gasconade county, Mo., eighty-one miles from St. Louis. It is a noted wine-producing town, and its inhabitants are mostly Germans. Pop. (1890), 1,410.

HERMAN, BINGER, a United States Congressman, born in 1843. In 1866 he was admitted to the Oregon bar, the same year was elected to the legis-

lature, and two years later to the State Senate. In 1868-71 he was deputy collector of United States internal revenue for Southern Oregon, and from 1871 to 1873 was receiver of public moneys at the United States land office at Roseburg. He was a member of the 49th, 50th, 51st, 52d, and 53d Congresses.

HERMETIC BOOKS, the sacred canon of the ancient Egyptians, consisting of forty-two books, divided into six sections. They constitute what is virtually an encyclopædia of Egyptian wisdom, in that they treat of religion, the arts and science. The name "hermetic" comes from Hermes Trismegistus ("Hermes Thrice-greatest"), Greek name of the Egyptian god Thoth, regarded as the originator of Egyptian culture. These books are evidently based upon the Egyptian mythology, but at a time when it was beginning to feel the influence of Hellenistic culture. The Greek and Latin texts of the hermetic books exist only fragmentarily, in the writings of Stobæus, Cyrillus, Suidas and Lactantius. The teachings of Thoth were at first regarded as esoteric doctrines, and as such jealously guarded by the sages, and from them transmitted to their pupils. Thoth was also the inventor of magic and alchemy, whence the latter was sometimes called the *hermetic art*, and whence are derived the terms *hermetic medicine*, *hermetic freemasonry* and *hermetically sealed*.

HERMODACTYL ("Hermes's finger"), a bulbous root, formerly brought from Turkey, and much esteemed as a cathartic, but entirely discarded in modern times. It is probably obtained from *Colchicum variegatum*.

HERNANDEZ-VELASCO, GREGORIO, a Spanish priest and poet, born at Toledo about 1550; translated the *Æneid* of Virgil into Spanish verse (1585). Though the style is rather inflated, the version is correct and presents some elegant passages.

HERNDON, WILLIAM LEWIS (1813-57) an American naval officer, born at Fredericksburg, Va. He served in the American navy and in the Mexican war. In 1851 he was sent to explore the Amazon River. He crossed the Andes from Lima to the headwaters of the Amazon, and then sailed down the river in a canoe. The United States Government published two volumes of Herndon's *Exploration of the Valley of the Amazon*. In 1857 he was captain of the steamer *Central America*, which with 580 persons on board, sailing from Havana for New York, sank in the Gulf-stream. The women and children were saved, but Herndon with 426 men sank with the vessel.

HEROIC AGE: in Greek history or mythology, the age preceding the true historic period. The heroes of that time were regarded by the ancients as intermediate between gods and men, and were venerated much as the saints of Christianity are now. The heroic age furnished abundant material for dramatic and epic poetry of later times, and afforded noble examples of courage, purity and justice.

HEROIC VERSE, the form of verse adapted to heroic or epic poetry. In classic poetry it is the common hexameter verse; in English, German and Italian the iambic of ten syllables; and in French the iambic of twelve syllables.

HERON. See Britannica, Vol. XI, pp. 760-62.

HERO'S FOUNTAIN, a pneumatic apparatus named from its inventor, Hero of Alexandria.

HERO'S FOUNTAIN.

This instrument, through the elastic force of a confined body of air, increased by hydraulic pressure and reacting upon the surface of water in a closed reservoir, produces a jet which may rise above that surface to a height equal to the effective height of the pressing column. An open basin connected with two closed reservoirs on different levels below constitutes the instrument, a simple mode of constructing which is shown in the annexed figure. The column of water in the tube *a* compresses the air in *b*; this presses on the surface of the water in *c*, and causes it to gush out at *d*.

HERRERA, Y CABRERA, DESIDERO (1792-1856), a Cuban writer and educator, born in Havana, Cuba. After studying in his native city he devoted himself to teaching and journalism. He published *Agriensura Cubana, Observaciones Científicas*, which Arago translated into French; *Hurricanes de la Isla de Cuba, Topografía Médica de Cuba, Lecciones de Agriensura*, a treatise on meteorology, and a number of scientific pamphlets.

HERRING. See *Britannica*, Vol. XI, 764-65.

HERRING SILVER, money paid in lieu of supplying a religious house with a certain number of herrings. See *TITHES*, in *Britannica*, Vol. XXIII.

HERRISON: in heraldry, the hedgehog; a charge allusively borne by families of the name of Harris.

HERSCHELL, FARRER, an English statesman, born in 1837. After being educated at the Universities of London and Bonn he became a queen's counsel in 1872, and recorder of Carlisle in 1873. In 1880 he was solicitor-general in Gladstone's ministry, and in 1886 he was raised to the peerage and became lord chancellor. On the appointment of a royal commission to inquire into the working of the metropolitan board of works, Lord Herschell was elected president of this commission. In 1892 he was again lord chancellor.

HERVÉ, AIME MARIE EDOUARD, a French journalist, born May 28, 1835, in the island of Réunion. In 1854 he entered the normal school, but he sent in his resignation shortly afterward, in order that he might devote his undivided attention to journalism. He was connected first with the *Revue de l'Instruction Publique*, and the *Revue Contemporaine*, to which he contributed (1860) the political summary; and he then became editor of the *Courrier de Dimanche* (1863), of the *Temps* (1864), and the *Epoque* (1865). After the publication of the imperial letter of January 19, 1867, inaugurating a new system for the press, M. Hervé established, in conjunction with M. Jean Jacques Weiss, the *Journal de Paris* (1867), which became noted for its persistent attacks on the imperial régime. At the general election of May, 1869, M. Hervé came forward, in the circonscription of Arras, as the candidate of the Liberal opposition, under the patronage of M. Thiers, but he was defeated at the poll by the official candidate, M. Sens. M. Weiss having retired from the strife of political journalism, on being nominated general secretary of the ministry of fine arts, M. Hervé remained sole editor of the *Journal de Paris*, and on February 5, 1873, he started the *Soleil*, a large, political, half-penny newspaper, which, at the outset, was merely an offshoot of the *Journal de Paris*, and conducted by the same literary staff. After the visit of the Comte de Paris to Frohsdorf, which preceded the attempt to reestablish the ancient monarchy, M. Hervé proclaimed loudly "the reconciliation of the House of France," and engaged, with reference to this subject, in an animated controversy with M. Edmond About, the editor of the *Dix-Neuvième Siècle*. This dispute ended in a duel in which M. About was slightly wounded. After the proclamation of the Septen-

nate, M. Hervé supported the policy of the Broglie, Cussy, and Buffet cabinets. On April 28, 1876, M. Hervé announced to the readers of the *Journal de Paris* the discontinuance of that journal, after nine years of a stormy existence; and since then he has remained editor of the *Soleil*.

HERWARTH VON BITTENFELD, KARL EBERHARD, Prussian general, born at Grosswerther, Sept. 4, 1796, died at Bonn, Sept. 2, 1884. He entered the military service in 1811, and gained his first laurels in the war of liberation, especially in the battle of Leipzig. In 1863 he was promoted to the rank of general, and in 1864 commanded the Prussian troops against Denmark, distinguishing himself by his daring capture of the Isle of Alsén. In the campaign of 1866 he was intrusted with the occupation of Saxony, and then with the command of the army which advanced from Saxony into Bohemia. He gained victories at Hühnerwasser and Münchengrätz, and took a prominent part in the battle of Königgrätz. In 1870, on the outbreak of the Franco-German war, he was made governor of the Rhine provinces, and in 1871 a general field-marshal.

HERWEGH, GEORG, German poet and politician, born at Stuttgart May 31, 1817, died at Baden-Baden, April 7, 1875. He studied at Tübingen, was drafted into the army, and subsequently went to Switzerland, where in 1841 he published his successful *Gedichte eines Lebendigen*, a collection of political songs. He returned to Germany in 1842, but soon after incurred the displeasure of the king of Prussia, and was obliged to retire a second time to Switzerland, where in 1843 he published 21 *Bogne aus Schweiz*.

HERZ, HENRI, pianist and composer, born of Jewish parentage at Vienna in 1806, and educated in Paris, where his talent was early recognized. His compositions became popular over Europe, and he was received with applause on visiting England in 1834 and America in 1846. In 1837 he received the decoration of the Legion of Honor, and from 1842 till 1874 he was professor of music at the Conservatory of Paris. He was also manager of a pianoforte factory, and in 1855 his pianofortes won the first prize at the Paris Exhibition. His compositions, more than 200 in number, are mostly for the piano. He died in 1888.

HERZOG, JOHANN JAKOB, German theologian of the Reformed creed, born at Basel, Sept. 12, 1805, died Sept. 30, 1882. He studied theology in his native city and in Berlin, became professor at Lausanne in 1830, at Halle in 1847, and at Erlangen in 1854, retiring in 1877. Among his works are: *Calvin* (1843); *Das Leben Ecolampadii* (1843); *Die Romanischen Waldenser* (1853); but his name is best known for the great theological encyclopædia edited by him, *Realencyklopädie für Protestantische Theologie und Kirche*, 22 vols., 1854-68; new ed. 18 vols., 1877-88; English abridged ed., by Schaff, 3 vols., 1882-4.

HESSE, a grand-duchy of the German empire. Area (1893), 2,965 square miles. Population, 956,611. Capital, Darmstadt. For history, productions and early statistics, see *Britannica*, Vol. XI, p. 780.

The former landgraves of Hesse had the title of grand-duke given them by Napoleon I., in 1806, together with a considerable increase of territory. At the Congress of Vienna this grant was confirmed, after some negotiations. The reigning family are not possessed of much private property, but dependent almost entirely upon the grant of the civil list, amounting to 1,244,488 marks, the sum including allowances to the princes.

The executive is assisted by a ministry, divided at present into three departments, viz.: of the

grand-ducal house and foreign affairs; of the interior and justice; and of finance.

The largest towns of the grand-duchy are: Mayence with a population, in 1890, of 72,281; Darmstadt, 36,503; Offenbach, 35,154; Worms, 25,504; Greissen, 20,611.

Of the population on Dec. 31, 1885, there were, of Protestants, 648,939; Roman Catholics, 278,440; other Christian sects, 7,957; Jews, 26,114; and 161 of no religion.

HESSIAN FLY. See Britannica, Vol. XI, p. 781.

HETEROCERCAL (Gr. *heteros*, "different," "unequal," and *kerkos*, "a tail," a term introduced by Agassiz, to designate the unsymmetrical tail of *Elasmobranchii*, and most ganoid fishes, in which the vertebral axis is bent upwards in the tail, making the upper lobe much the larger—a structure still seen in the sharks and sturgeons. In bony fishes also the axis is somewhat bent upwards in its termination; but the asymmetry is disguised, and the tail looks equal-lobed or homocercal, as in the herring.

HETEROGANGLIATA, a term introduced by Owen and adopted by many zoölogists, in accordance with a scheme of classification founded on the nervous system in animals to designate the mollusca of Cuvier, with which are ranked the "zoophytes" of the division *Polyzoa*, or *Bryozoa*. The nervous centres or ganglia are not arranged in a longitudinal series of symmetrical pairs, but are variously distributed in different parts of the body; one principal ganglionic mass, however, occupying a position above the gullet, with which all the nerves of the special senses are connected.

HETH, HENRY, an American general, born in Virginia in 1825. He was a West Point graduate. When Virginia seceded he was a captain of infantry, but resigned promptly and entered the service of his native State as brigadier-general. In 1863 he was major-general, and commanded a division in General A. P. Hill's corps in Virginia. He fought at Chancellorsville, Gettysburg, and in the campaigns of 1864-65. He surrendered with General R. E. Lee.

HETMAN, or ATAMAN, the title of the head or general of the Cossacks.

HEVES, a town of Hungary, sixty miles east-northeast of Pesh.

HEWES, JOSEPH, a signer of the Declaration of Independence, born in Kingston, N. J., in 1730, and died in Philadelphia, Pa., Oct. 29, 1779. In 1774 he was a delegate to the Continental Congress, and assisted in the preparation of the report on "the statement of the rights of the colonists, the several instances in which these rights are violated, and the most proper means for obtaining their restoration." He belonged to the Society of Friends. When this society denounced the proceedings of Congress he severed his connection with it, and became even a promoter of war. In 1776 he was one of the signers of the Declaration of Independence, and was at the head of the naval committee. Hewes declined a reelection, in 1777, but resumed his seat in Congress in 1779.

HEWIT, NATHANIEL AUGUSTUS, an American clergyman, born at Fairfield, Conn., in 1820. He studied theology at East Windsor, Conn., and in 1843 was ordained deacon in the Protestant Episcopal church. While holding a charge in North Carolina he became a Roman Catholic, and was ordained in that church in 1847 by Bishop Reynolds. Hewit was thereupon appointed vice-principal of the Charleston Collegiate Institute. He joined the order of the Redemptorists in 1850; and in 1853, on the foundation of the congregation of St. Paul by Father Hecker, Hewit became one of

its chief members, taking the religious name of Augustine Francis. In the Paulist Seminary in New York city he was professor of philosophy, theology and Holy Scriptures since 1865. From 1869 till 1874, he edited the "Catholic World." He has been active as an author, and has published *Reasons for Submitting to the Catholic Church*; *Life of Princess Borghese*; *Problems of the Age*; *Light in Darkness*; *The King's Highway*; and many other works.

HEWITT, ABRAM STEVENS, an American statesman, born at Haverstraw, N. Y., in 1822. After graduating at Columbia College he studied law and was admitted to the bar in 1845. His impaired eye-sight made him soon give up the practice of law, and he became associated with Peter Cooper in the manufacture of iron. The firm Cooper & Hewitt now own and control the Trenton, Ringwood, Pequest and Durham iron works. He was a commissioner to the French exhibition of 1867, and made a report on "iron and steel." He married Peter Cooper's daughter, and has been secretary of the Cooper Union for the Advancement of Science and Art since its incorporation in 1859. Hewitt was elected to Congress in 1874 as a Democrat, and served continuously, with the exception of one term, until 1886. He advocated moderate tariff reform. In 1886 he was elected mayor of New York city. In this office he enforced the laws strictly, and held the heads of the departments strictly accountable. In 1887 Columbia College gave him the degree of LL.D. on account of his expert knowledge in the manufacture of iron.

HEXACHORD: in modern music, denotes the six diatonic degrees of which Guido formed his scale.

HEXAHEDRON, a solid figure bounded by six faces—the cube being one.

HEXAMETER, the name applied to the most important form of classical verse. It is the heroic or epic verse of the Greeks and Romans, the grandest examples of which are the *Iliad* and *Odyssey* in Greek and the *Æneid* in Latin. It consists of six feet, or measures, the last of which must be a spondee (a measure composed of two long syllables), and the penultimate a dactyl (one long syllable and two short). If the penultimate is also a spondee, the verse is said to be spondaic. Klopstock, Goethe and Voss have produced admirable specimens of hexameter verse in German, and it has become familiar in English through Longfellow's *Evangeline*. The following lines from the last show the only varieties of the hexameter which are endurable to the ear—that is, those in which the accent on each foot falls on its first syllable:

Felt she in | myriad | springs her | sources | far in the |
mountains.
Stirring, col | lecting, | heaving up | rising | forth out | flow-
ing.

It will be observed that on whatever syllable here the metrical accent falls, that syllable is precisely the same which the voice naturally accentuates. Whether this was the case in ancient Greek and Latin hexameters we do not know; but, if the present system of Greek accentuation represents the natural accent of Homeric words, Homer disregarded the natural accents, or did not observe our rule of always placing the metrical accent on the first syllable of each foot; and we still pronounce Latin hexameters by preserving what we take to be the natural accent of each word, whether that corresponds to the metrical accent or not. Thus, in the line—

Itali | am fa | to profu | gus La | viniaque | venit,

we disregard the metrical accent, which should

fall on the first syllable of each foot (and actually does so on the fifth and sixth), and in reading the line give effect to the natural accents only, as we conceive them, to the words *Italian, futo, profugus*.

When English hexameters were first written they were constructed in the same manner; the natural accent, except in the last two feet, overruled the metrical. In the following lines from Stanihurst's translation of the *Æneid*, it will at once be seen that the effect is absurd if we read the lines as modern English hexameters are read:

Either here | are crouch | ing some | troops of | Greekish as- |
semble,
Or to crush | our bul | warks this | work is | forged, all-
houses
For to pry, | surmount | ing the | town; some | practice or
other
Here lurks | of cun | ning; trust | not | this | treacherous en-
sign.

If we read by the natural accent, the effect is rough and harsh to the ear; if by the modern metrical, ridiculous and absurd. Such are the limitations of the hexameter in English.

HEYSE, PAUL JOHANN, German author, born in Berlin, March 15, 1830, educated there and at Bonn. He was one of the band of authors whom King Max of Bavaria gathered around him in Munich in 1854. He has published more than a score of collections of novelettes under various titles, good specimens of which are contained in *Das Buch der Freundschaft* (1883-84). His poetic works include narrative poems, such as *Urica*, 1852; and epics, such as *Die Braut von Cypern*, 1856; and *Thekla*, 1858. As a dramatist he has been a voluminous writer of dramas, but few if any of his dramatic pieces have been unequivocally successful. He has also written a couple of more ambitious novels, *Die Kinder der Welt*, (1873), and *Im Paradiese* (1875), which have been very popular; and has translated the poetical works of Giusti, of Leopardi, and of Parini, Monti and Manzini.

HEYWARD, THOMAS, JR. (1746-1809), an American statesman, born in South Carolina. He studied law in the Temple in London. After returning home he was elected to the Continental Congress of 1775, and became one of the signers of the Declaration of Independence. In 1778 he was appointed judge of the criminal and circuit court of South Carolina. At the siege of Charleston, May 12, 1780, he commanded a battalion of volunteers, and on the surrender of the city was taken prisoner and sent to St. Augustine, Fla., where he was confined one year. After his release he resumed his office as State judge. In 1790 he was a member of the constitutional convention, and then retired to his plantation.

HIAWATHA, a city and county-seat of Brown county, Kan., 40 miles west of St. Joseph, Mo. Pop. (1890), 2,486.

HICKMAN, a city and county-seat of Fulton county, Ky., on the Mississippi River. Pop. (1890), 1,652.

HICKOK, LAURENS PERSEUS (1798-1888), an American clergyman and philosopher, born at Bethel, Conn. After studying theology he became successively pastor at Newton, Kent and Litchfield, Conn., from 1822 to 1836. In the latter year he was appointed professor of theology in the Western Reserve College, and in 1844 professor of the same branch in the Auburn Theological Seminary. In 1852 he removed to Schenectady, N. Y., to become professor of mental and moral science and vice-president of Union College there. From 1860 to 1866 Dr. Hickok

was president of the same college. At the age of seventy Dr. Hickok retired (1868) to Amherst, Mass., where he devoted himself to philosophical studies. He published *Rational Philosophy* (1848); *System of Moral Science*; *Empirical Psychology*; *Rational Cosmology*; *Creator and Creation*.

HIDALGO, F. COSTILLA, was born in Mexico, May 8, 1753, and died in Chihuahua, July 30, 1811. He studied at Valladolid, and in 1779 went to the city of Mexico, where he became a priest. In December, 1809, a conspiracy was formed at Valladolid against the Spanish government of Mexico; of this Hidalgo was a member. After some preliminary disturbances, Hidalgo issued a declaration of independence to the people of Suevato. With about 1,000 men he marched on San Miguel; his numbers were greatly increased by armed people, gathered from the country districts. Arriving at Celaya, Hidalgo was elected general-in-chief. With an irregular body of about 50,000 followers, promiscuously armed, his force invaded Guanajuato, stormed the place, and, in accordance with the fashion of Indian warfare, massacred the inhabitants. After establishing a canon-foundry and mint, he marched against Valladolid, and occupied it without much resistance. Many of his plundering followers deserted, and on December 2d, Hidalgo began his retreat. On the 7th his body of troops and pillagers were attacked near Acula by General Callega, and the greater part dispersed. Hidalgo then took refuge in Valladolid. Here he organized a government, and prepared to resist the Spanish forces. On January 17, 1811, 6,000 Spanish troops attacked the mob of 100,000 armed natives, and won a complete victory. On July 29th Hidalgo, who, before this, had been excommunicated by the Roman church, was degraded from his sacerdotal character, and executed on the following day.

HIGGINS, ANTHONY, a United States Senator, born in 1840. He was admitted to the Delaware bar in 1864, and in the same year was appointed deputy attorney-general. From 1869 to 1876 he was United States Attorney for Delaware, and in 1889 took his seat in the United States Senate as a Republican. His term of service expires March 3, 1895.

HIGGINSON, FRANCIS, a New England clergyman, born in England in 1588, died in Salem, Mass., in 1630. He was a Puritan preacher of great influence in Leicester, England. In 1628 he was invited by the Massachusetts Bay Company to accompany its expedition to New England. He arrived at Salem on June 29, 1629, and was soon after chosen teacher of the congregation. He drew up a confession of faith which was assented to by 30 persons. During the ensuing winter he was attacked by a fever which disabled him, and finally caused his death. He wrote *New England's Plantation*, or *A Short Description of the Commodities of that Country* (1630).

HIGGINSON, THOMAS WENTWORTH, an American author, born at Cambridge, Mass., in 1823. He studied theology at the Divinity School at Cambridge, and was ordained Congregational pastor at Newburyport, Mass., in 1847. He preached and worked against slavery. This did not suit his congregation, and he resigned his charge in 1850. In 1852 he became pastor of a free church at Worcester, Mass. In 1853 he attempted to rescue a fugitive slave from the custody of the United States Marshal in Boston, and was wounded in the face. As a man had been killed in his attack on the courthouse Higginson was indicted for murder, but escaped finally through a flaw in the indictment. In 1856 he went to Kansas, and was conspicuous in the movement to make it a free State.

On the outbreak of our civil war he was made a captain in a Massachusetts regiment. In November, 1862, he became colonel of the 1st South Carolina volunteers, the first regiment of former slaves mustered into the service of the United States. With this regiment (afterward the 33d United States colored infantry) he made various expeditions in South Carolina and Florida; but he was wounded in 1863, and compelled to retire in October, 1864. Living at Cambridge, Mass., he was elected to the State legislature in 1880, and has since been a member of the Massachusetts State Board of Education. Higginson has published *Out-Door Papers*; *Harvard Memorial Biographies*; *Malbone, An Oldport Romance*; *Army Life in a Black Regiment*; *History of the United States*; *Common Sense About Women*, advocating woman suffrage; and many other works on social and historical topics.

HIGH CHURCH and **LOW CHURCH**, two ecclesiastical parties in the Church of England, and in the Protestant Episcopal church. The terms are used exclusively as adjectives. The high churchmen emphasize the doctrine of the Apostolic succession, and attach much importance to ceremonies and symbols in worship. Low churchmen usually reject the peculiar tenets of the high-church school, and emphasize the spiritual doctrines of the Gospel, while they make but little of ecclesiastical rules.

HIGHLAND, a city of Madison county, Ill. It has a Roman Catholic university, woolen and flour mills, and a foundry. Many Germans and Swiss reside here. Pop. (1890), 1,857.

HIGHLAND REGIMENTS, regiments originally raised in the north of Scotland. There are nine in the British army, of whom five wear the national costume. The first Highland regiment, the "Black Watch," was organized in 1739. See *ARMY*, *Britannica*, Vol. II, p. 580.

HIGH-LEVEL BRIDGE, at Halifax, England, opened in 1890, was built to provide railway accommodation for the upper part of the town, which is 400 feet higher than the station of the Lancashire and Yorkshire Railway. The line ascends in a ruling gradient of one in fifty with sharp curves, and several deep cuttings; there are also a tunnel of 820 yards, a viaduct of ten spans of 50 feet each, and a number of bridges. The total length is three and one-half miles, and there are two stations. The cost was £300,000.

HIGH MISDEMEANOR, an offense closely bordering on treason. See "Cognate Offenses," under *TREASON*, *Britannica*, Vol. XXIII, pp. 528-29.

HIGH SEAS, the open sea, including the whole extent of sea, not the exclusive property of any particular country. The rule of international law is that every country bordering on the sea has the exclusive sovereignty over such sea to the extent of three miles from its shores, all beyond being common to all countries. The part of the sea within three miles distance is generally called the territorial sea of the particular country, or *mare clausum*. The distinction has little effect on the right of navigation, but as regards fishing it is otherwise. See *FISHERIES QUESTION*, in these Revisions and Additions.

HIGHTSTOWN, a post-borough of Mercer county, N. J., fourteen miles northeast of Trenton. It contains three educational institutions, and manufactories of plows, chains, and doors. P., 1,875.

HIGHWAYMEN, robbers who attack passengers on the public road. Famous English highwaymen were Claude Duval, Swift Nick Newson (hanged at York in 1684), Dick Turpin and his comrade, Tom King, and Jerry Abershaw. The best known

"romances of the road" are W. H. Ainsworth's *Rookwood* and Lord Lytton's *Paul Clifford*.

HIGHWAYS. For general article on *HIGHWAYS*, see *Britannica*, Vol. XI, p. 810. In American countries, and generally on the continent of Europe, the "rule of the road" requires that in passing, both in riding and in walking, the *turning shall be to the right*. In Great Britain and Ireland, "carriages" in passing are required to *pass to the left* and "walkers" *to the right*. The following English couplets express the rule in quaint verse:

The Rule of the Road is a paradox quite;
For in driving your carriage along,
If you bear to the left, you are sure to go right,
If you turn to the right, you go wrong.

But in walking the streets 'tis a different case:
To the right it is proper to steer;
On the left there should be enough of clear space
For the people who wish to walk there.

HILDRETH, RICHARD, was born in Deerfield, Mass., June 22, 1807. He was admitted to the bar in 1830, and became connected with the Boston *Atlas* and other newspapers. For a number of years he was engaged on newspapers in Demerara, and in 1861 he became United States consul at Trieste, Austria. Among his most notable works were the *White Slave*, an anti-slavery novel, and a history of the United States in six volumes.

HILDRETH, SAMUEL PRESCOTT, born in Massachusetts, September 30, 1783; graduated in medicine at Andover, and removed to Ohio in 1806. He was for many years a contributor to leading scientific magazines, his special subjects being meteorology and geology. Doctor Hildreth died in 1863.

HILGARD, EUGENE WOLDEMAR, an American chemist, born at Zweibrücken, Bavaria, in 1833. He studied at the Royal Mining Academy in Freiberg, Saxony, at the Universities of Zürich and Heidelberg. In 1857 he became assistant State geologist of Mississippi, and in 1857 he was appointed chemist in charge of the laboratory of the Smithsonian Institution, and filled also the chair of chemistry in the National Medical College at Washington. From 1858 to 1866 he was State geologist of Mississippi, and till 1873 also professor of agricultural chemistry in the State University there. In 1873 Hilgard was called to the chair of geology and natural history in the University of Michigan, and in 1875 he accepted the professorship of agricultural chemistry and botany in the University of California, where he since remained. During 1881-83 he had charge of the agricultural division of the northern transcontinental survey.

HILGARD, JULIUS ERASMUS, an American engineer and scientist, born at Zweibrücken, Bavaria, in 1825. From 1843 to 1845, he studied civil engineering at Philadelphia. In the latter year he became one of Alexander D. Bache's assistants on the coast survey, and soon rose to the office of assistant in charge of the bureau at Washington. This place he held until the death of the superintendent in 1881, when he was appointed to fill the vacancy. Hilgard had also charge of the United States standard weights and measures, and in 1872 he was made a delegate to the international metric commission which met at Paris. In 1885, on the advent of Cleveland's administration, he was suspended and then permitted to resign. Professor Hilgard's work in terrestrial physics, geodesy, the magnetic survey of the United States, tidal action in harbors, etc., and his papers and lectures on these topics are of considerable scientific importance. Died in 1891.

HILL, AMBROSE POWELL, an American soldier, born in Culpeper county, Va., in 1825, died near Petersburg, Va., in 1865. He graduated at the United States Military Academy in 1847, served as lieutenant of artillery during the Mexican war, and was engaged in Florida against the Seminoles in 1849-50. When Virginia seceded, in 1861, Hill went with it and was appointed colonel of the 13th regiment of Virginia volunteers. After the battle of Bull Run he was promoted brigadier-general, and fought as such in the battle of Williamsburg, in May 1862, with such a spirit that he was made a major-general. He took part in the seven days' battles around Richmond, and was at the second battle of Bull Run. At the battle of Fredericksburg he held the right of Jackson's force, and repulsed the attack of Meade. At Chancellorsville, in May, 1863, he participated in Jackson's daring march and unexpected assault on Howard's division. After Jackson's death he became lieutenant-general, fought at Gettysburg, and in 1865 commanded the city of Petersburg during its siege. On April 2, of the same year, while reconnoitering, Hill was killed by a rifle shot.

HILL, BENJAMIN HARVEY, an American statesman, born in Jasper county, Ga., in 1823, died at Atlanta, Aug. 16, 1882. He practiced law successfully in La Grange, Ga., from 1845 to 1861. When his state seceded he was elected to the Confederate Senate at Richmond, where he remained till the close of the war. In 1875 he was elected to the United States Congress, but resigned on being chosen United States Senator in 1877.

HILL, CHARLES AUGUSTUS, a United States Congressman, born in 1833. He was admitted to the Illinois bar in 1860, and in 1862 entered the Union army, serving until the close of the war. In 1868 he was chosen State's attorney for the counties of Will and Grundy, and was elected as a Republican to the 51st, 52d and 53d Congresses.

HILL, DAVID B., United States Senator from New York, a lawyer, born in Havana, Vt., Aug. 29, 1844. He received a common-school and academic education; removed to Elmira, N. Y., and entered the profession of law. In politics he is a Democrat, and in 1865 was elected city attorney of Elmira; was elected a member of the State assembly in 1871 and 1872; was afterward elected mayor of Elmira. In 1882 was elected lieutenant-governor of the State of New York on the ticket with Grover Cleveland; became governor when Mr. Cleveland resigned to become President of the United States; was elected governor in 1885, and re-elected in 1887. In 1891 he was elected by the State legislature to the United States Senate, to succeed William M. Evarts.

HILL, DANIEL HARVEY, an American general, born in South Carolina in 1821. After graduating at West Point in 1842 he served through the Mexican war, resigned in 1849, and was made professor of mathematics in Washington College, Va., and in 1859 president of the military institute at Charlotte. On the outbreak of the civil war he became colonel of the 1st North Carolina volunteers and took part in the fight at Big Bethel, Va., in June, 1861. He then rose to the rank of major general, and commanded a division during the seven days' fight around Richmond in June, 1862. Afterwards he fought at South Mountain, Antietam, Fredericksburg and Chickamauga. At the close of the war Gen. Hill returned to Charlotte, N. C., where he published a monthly magazine, "Field and Farm"; and subsequently "The Land We Love"; also *Elements of Algebra*; *The Crucifixion of Christ*; and *Consideration of the Sermon on the Mount*.

HILL, THOMAS, an American clergyman and educator, born at New Brunswick, N. J., in 1818. He studied theology at Cambridge, and was ordained pastor at Waltham, Mass., in 1845. From 1859 to 1868 he was successively president of Antioch College and of Harvard College. In 1868 he resigned on account of bad health. Then he became botanist of the Hassler expedition around the coast of South America under Prof. Agassiz (1871). In 1872 he was pastor of a church at Portland, Me. Hill has published *Geometry and Faith*; *Liberal Education*; *True Order of Studies*; *Jesus the Interpreter of Nature*; *Natural Sources of Theology*, and some elementary mathematical books.

HILLIARD, HENRY WASHINGTON, an American statesman, born in Cumberland county, N. C., in 1808. He was admitted to the bar at Athens, Ga., in 1829, and appointed professor in the State University of Alabama in 1831. In 1838 he was elected to the legislature as a whig, and in 1842 President Tyler sent him as United States Minister to Belgium. From 1845 to 1851 he sat in Congress. At the outbreak of the civil war he went with the South, and held the nominal rank of brigadier-general in the Confederate army. After the war he resumed the practice of law at Augusta, and afterward at Atlanta. From 1877 to 1880 he was United States Minister to Brazil. Hilliard published a volume of speeches in 1855, and a novel.

HILO, an important seaport of Hawaii, situated on Byron Bay, an inlet on the east coast of the island. It is the second town in size in the Sandwich Islands, and has a spacious and commodious harbor. Population, 4,231.

HILLSBORO, a city and county-seat of Montgomery county, Ill., 66 miles northeast of St. Louis, Mo., on the Indianapolis and St. Louis Railroad. Pop. (1890), 2,000.

HILLSBORO, a post-village and county-seat of Orange county, N. C., 40 miles northwest of Raleigh. It has several tobacco factories and a military academy.

HILLSBORO, a city and county seat of Highland county, Ohio, 60 miles east of Cincinnati. It contains several educational institutions, banks, churches, factories, scale and agricultural works, and mills, and publishes several weekly papers. It is connected with Sardinia by 17 miles of narrow-gauge railroad, and is the terminus of a branch of the Marietta and Cincinnati railroad.

HILLSBOROUGH, a port of entry of Albert county, N. B., on Petitcodiac River. It has a good harbor, and exports gypsum and gas coal (albertite) to the United States.

HILLSBOROUGH, a post village of New Hampshire, in county of the same name, situated in the Contoocook Valley. It contains woolen mills, bedstead factory and shovel handle shops.

HILLSBOROUGH RIVER, or **Mosquito River**, in Volusia county, Fla., is a salt-water lagoon, a continuation of Halifax River, extending 30 miles south of Mosquito Inlet. It is separated from the ocean by a narrow strip of land, and was formerly called Mosquito South Lagoon.

HILLSDALE, a city and county-seat of Hillsdale county, Mich., 177 miles east of Chicago. It is the seat of Hillsdale College, and has a chair factory, machine shops, foundries and flour mills.

HILL STATES, a number of small principalities of India on the east side of the Upper Sutlej, comprising about 10,000 square miles and about 550,000 inhabitants. With the exception of this aggregate name they have but little in common with each other.

HILTED, a term used in heraldry to indicate the tincture of the handle of a sword.

HINCKS, SIR FRANCIS, a Canadian statesman, born at Cork, Ireland, in 1807, died in 1885. He settled at Toronto in 1832, when he entered politics and edited the "Examiner." After being elected to the Dominion Parliament, in 1841, he was appointed inspector-general. In 1851 he became prime minister of Canada, and held this post till 1854. The next year he was made governor of the Windward Islands, and in 1860 governor of British Guiana, where he remained till 1866. After returning to Canada he assisted in uniting the British provinces into the "Dominion of Canada." In 1869 Hincks was knighted. From that time till 1873, he was the finance minister of Canada.

HIND, JOHN RUSSELL, English astronomer, born at Nottingham, May 12, 1828. At an early period he became interested in the study of astronomy, and in 1840 obtained a situation in the Royal Observatory at Greenwich, where he remained till June, 1844. He was then sent as a member of the commission appointed to determine the exact longitude of Valentia, and on his return entered Mr. Bishop's observatory, Regent's Park, London. Here he calculated the orbits and declination of more than seventy planets and comets, noted a number of new movable stars, and between 1847 and 1854 discovered ten minor planets. In 1851 Hind obtained from the Academy of Sciences at Paris the Lalande medal and was elected a corresponding member, and in the following year received the gold medal of the Astronomical Society of London and a pension of £200 a year from the government. In 1853 he undertook the editing of the *Nautical Almanac*. His scientific papers were generally published in the *Transactions* of the Astronomical Society, in the *Comptes-Rendus* of Paris, and the *Astronomische Nachrichten* of Altona. He became president of the Royal Astronomical Society in 1880.

HINDMAN, THOMAS C., a Confederate general, born in Tennessee in 1818, died Sept. 27, 1863. In the Mexican war he served as lieutenant of Mississippi volunteers. During 1859 and 1860 he was in Congress. On the outbreak of the civil war he was made a brigadier-general in the Confederate army. He served first under General S. B. Buckner in Kentucky, and commanded afterwards at Memphis. He fought at the battle of Shiloh, was made a major-general, and assigned to the chief command in Arkansas. At Chickamauga he commanded a division in General Polk's army. He was killed at Helena, Ark., by one of his former soldiers.

HINGHAM, Mass., a manufacturing town of Plymouth county, fourteen miles southwest of Boston. Fancy knit goods, wooden ware, cordage, bagging, furniture, iron castings and worsted upholstery are made here. Pop. (1890), 4,564.

HINSDALE, a post-village of Cheshire county, N. H. It has good water-power, and among its manufactures are woolen goods, lumber and mowing machines. Pop. (1890), 2,258.

HINSDALE, BURKE AARON, an American educator and author, born at Wadsworth, Ohio, in 1837. In 1861 he became a minister of the Christian (or Campbellite) church; was pastor of a church at Solon (1864), and afterwards at Cleveland till 1868. Then he was made professor of history and English literature in Hiram College, and was its president from 1870 to 1882. Hinsdale has published: *Authenticity of the Gospels; Evolution of the Theological Systems of the Ancient Church; Life and Works of President Garfield; Schools and Studies*, etc. Hinsdale was also assistant editor of the "Christian Standard," and "Christian Quarterly," for many years.

HIP in architecture, the rafter at the angle where two sloping roofs meet. A roof is called a

hipped roof when the end is sloped upwards so as to form a hip on each side.

HIP-KNOB, an ornament carved in stone or wood, set on the apex of a gable or hipped roof, and forming a kind of finial.

HIPPARION, a genus of fossil horses. See horse, Britannica, Vol. XII, p. 174.

HIPPEAU, CELESTIN, a French author and educationist, born at Niort, Deux-Sèvres, May 11, 1803, died in 1883. His earlier studies were pursued in his native city, and he subsequently held positions as professor at Poitiers, Napoléon, Vendée, Strasburg, Paris and Caen. He received the decoration of the Legion of Honor in 1861. Among the most prominent of his writings are: *Histoire de l'Abbaye de Saint-Etienne de Caen, 1066-1790* (1855); *Histoire du Gouvernement de la Normandie* (1863-73); and *Avènement des Bourbons au Trône d'Espagne* (1875).

HIPPOCRAS (*vinum Hippocraticum*, "wine of Hippocrates"), an aromatic medicated wine, formerly much used as a cordial. It was prepared from white wine, flavored with cinnamon and other spices, lemon peel, almonds, etc., and sweetened with honey or sugar.

HIPPOCRATIC OATH, an engagement entered into by persons commencing the practice of medicine. The text of the oath has been ascribed to Hippocrates, and may, perhaps, be accepted as genuine; its comparative antiquity is not denied. It is the oldest and one of the best of the codes of medical ethics.

HIPPOGRIFE, or **HIPPOGRYPH** (Gr. *hippos*, "a horse," and the word *gryph*, "griffin"), a fabulous animal, unknown to the ancients, which is represented by modern writers as a winged horse with the head of a griffin. The hippogriff figures as the horse of the Muses, and plays a conspicuous rôle in the *Orlando Furioso* of Ariosto.

HIPPOPHAGY, **HIPPOPHAGI** (Gr. "eaters of horse-flesh"), was a name given by the Greeks to a Scythian people living northeast of the Caspian Sea, and to a Sarmatian tribe north of the Euxine. In some parts of Europe horse-flesh is a regular and wholesome article of diet. In 1866 the sale of horse-flesh in the Paris markets as an article of food was officially recognized and regulated, and during the siege of Paris, horse-flesh was gladly eaten by all who could get it. In Great Britain an act was passed in 1889 regulating the sale of horse-flesh, requiring that all horse-flesh exposed for sale should be expressly so described.

HIPPURIC ACID, $C_7H_5NO_3$, a compound of great interest to chemist and physiologist. It derives its name from its having been first discovered in the urine of the horse, and that fluid, or the renal secretions of the cow, affords the best and readiest means of obtaining it. The crystals of hippuric acid are moderately large, colorless, but subsequently becoming milk white, four-sided prisms, which are devoid of odor, but have a faintly bitter taste. They dissolve readily in boiling water and in spirit. It is an abundant normal constituent of the urine of the horse, cow, sheep, etc., and probably is to be found in the urine of all vegetable feeders. In the urine of healthy persons living on an ordinary mixed diet it occurs in very small quantity, but it is increased by an exclusively vegetable diet and in the well-known disease diabetes. The hippuric acid occurring in the animal organism exists in combination with bases, and chiefly as hippurate of soda and hippurate of lime. The last-named salt can be obtained by the mere evaporation of the urine of the horse, hippuric acid readily splits into benzoic acid and glycocoll. If benzoic acid is administered it is ex-

creted as hippuric acid, combining with glycocholic acid in the body. In herbivorous animals the benzoic acid is largely derived from the food; in animal feeders, even in starvation, it occurs in small amount in the urine; and it is therefore concluded that its forerunners may be derived from the metabolism of the tissues. That certain bodies closely allied to benzoic acid may be so formed has now been experimentally demonstrated, while glycocholic acid can also be proved to be so produced. At one time the belief was entertained that these bodies were combined in the liver; but more recent search has shown that the synthesis chiefly takes place in the kidneys.

HIPPURITES, a remarkable genus of fossil bivalves, peculiar to the Cretaceous strata, and so abundant in some of the Lower Chalk beds of the Pyrenees that the series has received the name of hippurite limestone. The external form of the shell is so anomalous that some have called the genus a coral, others an annelid, others a barnacle, and so on, though the majority held it to be at least a mollusk. Investigation has shown that the hippurites were divergent bivalves. The right valve is very large, and elongated into a cone, while the left valve is inconspicuous and perforated by radiating canals. Including allied genera or sub-genera—for example, *Radiolites* and *Caprinella*—there are over a hundred species, all restricted to the Chalk and Chalk-marls.

HIRSCH, MORRIS BARON DE, a Hebrew capitalist and philanthropist, born in Bavaria. Originally a cattle merchant he gained a considerable amount of wealth, and then associated himself with the European banking-house of Bischoffsheim & Goldsmidt. A large portion of his fortune was made by his connection with the railroad leading from Buda-Pesth, in Hungary, to Varna, on the Black Sea. Baron Hirsch has founded and maintained many schools in Egypt, and in European and Asiatic Turkey, and in 1890 established in the United States the fund, known as the Hirsch Fund (*q. v.*) for the help of needy Hebrew immigrants. The Baron is a resident of Paris, France.

HIRSCH FUND, THE, was created by Baron Hirsch, of Paris, France, who executed, before the American Consul in February, 1891, a trust deed to a board of trustees in New York city, conveying to them \$2,400,000, to be invested in the United States, and the net income (estimated to be \$10,000 a month) to be loaned to needy Hebrew immigrants from Russia and Roumania, who have come to this country within two years. Baron Hirsch, during the year 1890, contributed \$10,000 monthly for the benefit of such Hebrew families. The specific purpose of the fund is to furnish mechanics with tools, teach them easy trades, pay their entrance fees into trades-unions, and, in exceptional cases, to lend the immigrants small sums to help them to become self-supporting. Day-schools and night-schools for children and adults are to be founded where the local authorities have made no provision for them. There are two clerks whose duty it is to look up Hebrew children who cannot attend the public schools on account of not being able to speak English. No money will be lent to peddlers, and the smallest amount will be \$5. During the last six months of 1890 the trustees of this fund provided situations in New York City for 2,888 immigrants.

HISCOCK, FRANK, a United States Senator, born in 1834. He was admitted to the New York bar in 1855, and from 1860 to 1863 served as district attorney of Onondaga county. He was a member of all the Congresses from the forty-fifth to the fifty-third inclusive, and in 1887 took his seat in the United

States Senate as a Republican. His term of service expired March 3, 1893.

HITCHCOCK, ETHAN ALLAN (1798-1870), an American general and author, born at Vergennes, Vt. After graduating at West Point in 1817, he was assistant instructor in tactics there till 1829, and from that time till 1833 he was commandant of cadets. In the Mexican war he was inspector-general under Scott. Becoming colonel in 1851, he was placed in command on the Pacific coast. When the civil war broke out he was appointed major-general of volunteers in the Union army in February, 1862, and soon afterwards made commissary-general of prisoners. He retired from service in October, 1867, and died at Sparta, Ga., Aug. 5, 1870. Among his published writings are: *The Doctrines of Swedenborg and Spinoza Identified*; *Alchemy and the Alchemists*; and *Christ the Spirit*.

HITCHCOCK, ROSWELL DWIGHT (1817-87), an American theologian, born at East Machias, Maine. He studied theology at Andover, and was ordained pastor of the first Congregational church at Exeter, N. H., in 1845. Afterward he spent a year at the Universities of Halle and Berlin in Germany. In 1852 he was professor of natural and revealed religion at Bowdoin College; in 1855 professor of church history in Union Theological Seminary, New York; and in 1880 he became president of that seminary. In 1866 he visited Italy and Greece; in 1869 Egypt and Palestine, and in 1885 he again went abroad. Doctor Hitchcock published a *Complete Analysis of the Bible*, and edited the *Life and Writings of Edward Robinson*. He received the degree of D.D. from Bowdoin College in 1855, and of LL.D. from Williams College in 1873.

HITT, ROBERT ROBERTS, a United States Congressman from Ohio, born in 1837. From 1874 to 1881 he was first secretary of legation at Paris, and *chargé d'affaires ad interim*; was assistant Secretary of State in 1881, and in 1882 was elected to the 47th Congress. He was reelected to the 48th, 49th, 50th, 51st, 52d and 53d Congresses as a Republican.

HIVITES ("villagers," or "midlanders"), a Canaanitish people, the main body of which lived in the region from Lebanon and Hermon to Hamath, but who had colonies, apparently isolated, in southern Palestine, as at Gibeon.

HOAR, EBENEZER ROCKWOOD, an American jurist, born at Concord, Mass., in 1816. He was admitted to the bar in 1840. In 1849 he became judge of the court of common pleas, but resigned in 1855. Soon after he was appointed a judge of the Supreme Court of Massachusetts, and held this office until 1869, when President Grant appointed him Attorney-General of the United States. Mr. Hoar was a member of Congress from Washington from 1873 to 1875.

HOAR, GEORGE F., a United States Senator, born in 1826. He was admitted to the Massachusetts bar in 1848, and in 1860 was city solicitor of Worcester. In 1852 he was a member of the State house of representatives, and of the State senate in 1857. He was a member of the 41st, 42d, 43d and 44th Congresses, and in 1877 took his seat as a Republican in the United States Senate. In 1883 and 1889 he was reelected.

HOAR, SAMUEL, an American statesman, born at Lincoln, Mass., in 1773, died at Concord, Mass., in 1856. Being admitted to the bar in 1805, he soon became eminent in his profession. He was a member of Congress in 1835-37, and a State councillor in 1845-46. The State of Massachusetts sent him to South Carolina in 1844, to test the constitutionality of acts of the latter State, by which free negro sailors were seized and imprisoned on entering its

ports. But on December 5th, of the same year, he was driven from Charleston by a mob, and the State Legislature authorized the governor on the same day to expel him from the State.

HOBART, JOHN HENRY, bishop in the Protestant Episcopal Church, born at Philadelphia in 1775, died at Auburn, N. Y., Sept. 10, 1830. He studied theology in 1796-98, while he was a tutor at Princeton College. He was ordained deacon in 1798; priest in 1801; assistant rector of Trinity Church, New York, in 1812, and rector in 1816. In the latter year he became bishop of New York, and in 1821 professor of pastoral theology and pulpit eloquence in the General Theological Seminary of New York.

HOBART PASHA, the Honorable Augustus Charles Hobart Hampden, third son of the Earl of Buckinghamshire, born at Waltham-on-the-Wolds, in Leicestershire, April 1, 1822, died at Milan, June 19, 1886. He entered the British navy in 1836, served first against the slavers in Brazilian waters, then in the Baltic in the Crimean war, and at the outbreak of the civil war in America became known as the commander of a blockade-runner. In 1867 he entered the service of Turkey, and for his distinguished services in checking the Greek blockade-runners to Crete, was raised to the rank of pasha, and 1874 made admiral of the Ottoman fleet. He commanded the Turkish Black Sea fleet in 1878, and was in 1881 made Turkish marshal.

HOBHOUSE, JOHN CAM, English statesman, born June 27, 1786, died June 3, 1869. He was educated at Cambridge, entered parliament in 1820 as an advanced Liberal and was successively Irish secretary, commissioner of woods and forests, and president of the board of control. He was created Baron Brough-ton in 1851.

HOBOKEN, a city and port of entry of Hudson county, N. J., on the west bank of the Hudson River, opposite New York City, and immediately above Jersey City. It has an extensive trade in coal, being one of the principal depots from which New York and its shipping are supplied, and three lines of European steamships start from this port. The principal industries of the place are connected with these steamships and the coal docks. Population, 1870, 20,297; 1880, 30,999; 1890, 43,561.

HOCHHEIM, a town of Prussia, in Hesse-Nassau, on the right bank of the Main, three miles east of Mainz. Here is produced the white wine known as *Hochheimer*.

HOCHKIRCH, or HOCHKIRCHEN, a village in Saxony, a few miles east by south from Bantzen, was the scene of a battle between the Austrians and Prussians, Oct. 14, 1758, during the Seven Years' war.

HODGE, CHARLES, an American theologian, born in Philadelphia, Dec. 28, 1797; graduated at Princeton College in 1815; in 1822 appointed professor in the Princeton Theological Seminary, where he remained till the close of his life. He was founder and long the editor of the *Princeton Review*; and besides numerous essays, etc., he was the author of commentaries on Romans, Corinthians, and Ephesians, of a history of the Presbyterian Church in America (1840), and of the well-known *Systematic Theology*, now a standard work of the Calvinistic churches. He died June 19, 1878.

HODGE, ARCHIBALD A., born in Princeton, N. J., July 18, 1823; died there in 1886. He graduated at Princeton in 1841, spent three years as a missionary in India, 1847-50, and was afterward in charge of parishes in Maryland, Virginia and Pennsylvania. He became editor of the *Princeton Review*, and in 1878 was elected professor of didactic and polemic theology in Princeton Theological Seminary, to succeed his father.

HODGKINSON, EATON, engineer, born in Chesh-

ire, Feb. 26, 1789. At the age of twenty-one he overturned the theories of Tredgold, at that time the principal authority on iron beams. In 1847 he was appointed professor of the mechanics of engineering in University College, London. He cooperated in the construction of the Britannia bridge. He died June 18, 1861.

HODSON, MAJOR WILLIAM STEPHENS RAIKES, English soldier, was born at Maisemore Court, near Gloucester, March 19, 1821. Choosing the life of a soldier, he joined the Indian army in 1845. From 1849 to 1852 Hodson was employed in the work of civil government in the Punjab. Then, being made commandant of the Guides corps, he did excellent service on the turbulent frontier. But in 1856 he was deprived of his command on account of irregularities in the regimental accounts and of his unjust treatment of the troops and natives under his authority. In the crisis of the mutiny, however, he was appointed head of the intelligence department in the army engaged before Delhi, and was commissioned to raise a new regiment of irregular cavalry, which became known as "Hodson's Horse." With this body of men Hodson took part in the siege of Delhi and in the subsequent operations down to the siege of Lucknow. After the fall of Delhi, Hodson discovered the Mogul sovereign and his sons; these last he shot dead with his own hand at the time of capture. He himself was shot on March 11, 1858, during the assault on a royal palace in Lucknow, and died on the following day.

HOE, RICHARD MARCH, born in the city of New York, Sept. 12, 1812; was the son of an English printer, who came to this country in 1803, and who invented the printing press known by his name. The son improved upon the invention of the father, and to his efforts are due the manifold improvements which the power press has received. Mr. Hoe died in Italy, June 7, 1886.

HOFFMAN, DAVID, an American jurist, born at Baltimore, in 1784, died suddenly at New York, Nov. 11, 1854. He was an eminent lawyer, and in 1817 became professor of law in the University of Maryland.

HOFFMANN, CHARLES FENNO, an American author, born at New York City, in 1806, died at Harrisburg in 1884. When he was eleven years old his leg was crushed, and had to be amputated above the knee. After studying law at Columbia College he was admitted to the bar in 1827. In 1833 he was the chief editor of the "Knickerbocker Magazine." After a trip through the West he wrote *A Winter in the West*, and *Wild Scenes in the Forest and the Prairie*, and a novel, *Greyslaer*. He also wrote poetry. The first volume is called *The Vigil of Faith*, and the second, *Borrowed Notes for Home Circulation*. A mental disorder, which attacked him in 1849, closed his literary career.

HOFFMANN, AUGUSTUS WILHELM, a German chemist, born at Giessen, April 8, 1813. After obtaining the degree of doctor of philosophy, he became assistant to Liebig in the laboratory at Giessen; and, on the establishment of the Royal College of Chemistry in London in 1845, he was made superintendent of the new institution. From 1856 to 1865 he was chemist to the royal mint, and in 1865 accepted an appointment as professor of chemistry in the University of Berlin. He has made important discoveries in chemistry (see ANILINE, *Britannica*, Vol. II, p. 48), and has contributed numerous papers to the transactions of scientific societies—for the most part on the highest departments of organic chemistry. At Liebig's death he became editor of the "Annalen der Chemie." He was ennobled on his seventieth birthday, in 1888.

HOGG, QUINTIN, a distinguished English philan-

thropist, was born in February, 1845. He has taken a special interest in the education of homeless boys, young mechanics and artisans in London. In 1873 he started an institute for this purpose which consisted of only one room and a few members. In 1893 the membership had increased to over 12,000. The work of this "Polytechnic" is of a threefold character—social, educational, and religious.

HOGSHEAD, an old English measure of capacity no longer in use, but equivalent for wine to sixty-three gallons, for ale and beer to fifty-one gallons. In the United States the word now signifies a large cask.

HOHENZOLLERN, LEOPOLD, PRINCE OF, is the eldest son of the late Prince Charles Antoine of Hohenzollern-Sigmaringen, and was born Sept. 22, 1835. He was educated in the universities of Bonn and Berlin. He succeeded his father on June 2, 1885. The prince is an hereditary member of the Chamber of Seigneurs of Prussia, a general of Prussian infantry in the suite of the first regiment of footguards and a chevalier of the order of the Black Eagle. Prince Hohenzollern is best known in connection with his candidature for the throne of Spain, his pretensions to which became the ostensible cause of the late Franco-Prussian war.

HOLACANTHUS, a genus of fishes of the family *Chatodontidae*, remarkable for the beauty and symmetry of their colors, and for their excellence as articles of food. They have the compressed form and other general characteristics of the *Chatodontidae*, a single dorsal fin, and a large spine on the gill-cover. They are natives of the seas of warm climates. *H. imperator* is one of the esteemed fishes of the East Indies, rivaling the salmon in flavor.

HOLBROOK, JOHN EDWARDS, an American naturalist, born at Beaufort, S. C., in 1794, died at Norfolk, Mass., Sept. 8, 1871. After receiving his degree of M. D. from the University of Pennsylvania, he went to Europe to continue his medical studies there, especially at Paris. In 1824 he was made professor of anatomy in the Medical College of South Carolina, which position he held for more than 30 years. During the civil war he served as surgeon in a South Carolina regiment.

HOLDEN, a railroad junction of Johnson county, Mo., where timber, building-stone and coal are to be obtained in abundance. Pop. (1890), 2,520.

HOLDEN, EDWARD SINGLETON, astronomer, was born in St. Louis, Mo., Nov. 5, 1846. He studied at West Point, and subsequently held several positions in the army as instructor in mathematics and philosophy. In 1881 he became professor of astronomy in the University of Wisconsin and director of the new Washburn observatory, where he remained with brief intermissions until 1886, and published four volumes of observations. In 1883 he visited the Caroline Islands to observe a total eclipse of the sun. At the end of his engagement in Wisconsin he was chosen president of the University of California, and director of the Lick observatory on Mt. Hamilton, San José.

HOLDER, JOSEPH BASSETT (1824-88), an American zoölogist. In 1860 he entered the United States army, and was surgeon-in-charge at the United States military prison in Tortugas, Fla., until 1867, and then was assistant post-surgeon at Fortress Monroe, Va. In 1870 he was made curator of invertebrate zoölogy, ichthyology, and herpetology in the American museum of natural history, New York.

HOLIDAY, a holy day; a day set apart in commemoration of some historical event, or in honor of some person; a religious or secular festival, on which business is legally suspended, and the time spent in relaxation and amusement.

In the Latin countries, almost every Saint's day in the calendar is observed as a holiday. As these are very numerous, the loss to those engaged in manufacturing industries and business pursuits is a very serious one. In Great Britain many of the holidays observed in this country are also legal holidays, with the exception of the 4th of July and Thanksgiving. There has been within the last few years a growing agitation in the United States looking to the establishment of additional public holidays, and a growing tendency to recognize, during the summer months, the afternoons of Saturdays as a time to be devoted to the recreation of the masses. This "early closing movement" has become widely extended and has met with much encouragement from many of the largest mercantile and business firms in the most populous centers.

The following is a list of holidays in the United States, with the place of their observance:

JAN. 1. NEW-YEAR'S DAY: In Alabama, Arkansas, California, Colorado, Connecticut, Florida, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Michigan, Mississippi, Missouri, Nebraska, Nevada, New Jersey, New York, North Carolina, North Dakota, Ohio, Oregon, Pennsylvania, South Carolina, Tennessee, Texas, Utah, Vermont, West Virginia, Wisconsin, Washington and Wyoming.

JAN. 8. ANNIVERSARY OF THE BATTLE OF NEW ORLEANS: In Louisiana.

JAN. 19. LEE'S BIRTHDAY: In Georgia and Virginia.

FEB. 10, 1891. MARDI-GRAS: In Alabama and Louisiana.

FEB. 22. WASHINGTON'S BIRTHDAY: In Alabama, California, Colorado, Connecticut, Florida, Georgia, Idaho, Illinois, Indiana, Kansas, Kentucky, Louisiana, Maine, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New York, North Carolina, North Dakota, Ohio, Pennsylvania, Rhode Island, South Carolina, Texas, Utah, Virginia, Wisconsin, Washington and Wyoming.

MARCH 2. ANNIVERSARY OF TEXAN INDEPENDENCE: In Texas.

MARCH 4. FIREMEN'S ANNIVERSARY: In New Orleans, La.

MARCH 27, 1891. GOOD FRIDAY: In Alabama, Louisiana, Maryland, Pennsylvania and Tennessee.

APRIL 1, 1891. STATE ELECTION DAY: In Rhode Island.

APRIL 21. ANNIVERSARY OF THE BATTLE OF SAN JACINTO: In Texas.

APRIL 26. MEMORIAL DAY: In Alabama and Georgia.

MAY 10. MEMORIAL DAY: In North Carolina.

MAY 20. ANNIVERSARY OF THE SIGNING OF THE MECKLENBURG DECLARATION OF INDEPENDENCE: In North Carolina.

MAY 30. DECORATION DAY: In California, Colorado, Connecticut, Dakota, Iowa, Illinois, Indiana, Kansas, Kentucky, Maine, Massachusetts, Michigan, Minnesota, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New York, North Dakota, Ohio, Oregon, Pennsylvania, Rhode Island, Tennessee, Utah, Vermont, Wisconsin, Washington and Wyoming.

JULY 4. INDEPENDENCE DAY: In all the States.

SEPT. 7, 1891. LABOR DAY: In Colorado, Connecticut, Iowa, Massachusetts, Nebraska, New Jersey, New York, Ohio and Pennsylvania.

NOVEMBER —. GENERAL ELECTION DAY: In Arizona, California, Kansas, Indiana, Maryland, Missouri, New Hampshire, New Jersey, New York, North Dakota, Ohio, Oregon, South Carolina, Rhode Island, Tennessee, Texas, Washington, Wisconsin and Wyoming. In the States which hold elections in November, 1891, election day falls on the 3d instant.

NOV. 26, 1891. THANKSGIVING DAY: It is observed in all the States, though in some it is not a statutory holiday.

DEC. 25. CHRISTMAS DAY: In all the States, and in South Carolina the two succeeding days in addition.

Sundays and Fast Days (whenever appointed) are legal holidays in nearly all the States.

ARBOR DAY is a legal holiday in Idaho, Kansas, and Wyoming, the day being set by the Governor, in Nebraska, April 23d, and in Colorado on the third Friday in April (April 17, 1891). Arbor Day is also a legal holiday in Rhode Island, on a day set by the Governor, but does not affect the payment of notes, etc.

In Minnesota, Washington's Birthday and Memorial Day are the only general holidays expressly provided by law. As to the maturity of bills and notes, the following days are by implication holidays: Thanksgiving Day, Good Friday, Christmas, January 1st and July 4th; as to schools, Christmas, January 1st, July 4th and Thanksgiving Day.

In New Mexico there are no legal holidays established by statute, and in Delaware no State holidays.

The birthday of Abraham Lincoln, February 12, is a legal holiday in Illinois.

There is no national holiday, not even the Fourth of July. Congress has at various times appointed special holidays, but there is no general law on the subject. The proclamation of the President designating a day of Thanksgiving only

makes it a holiday in those States which provide by law for it.

HOLLAND, see *Britannica*, Vol. XII, pp. 59-98; also *NETHERLANDS*, in these Revisions and Additions.

HOLLAND, city of Ottawa county, Mich., in Holland township, containing banks, churches, schools, Hope College and iron-smelting furnaces, mills and tanneries. The town is largely populated by Hollanders, and four weekly newspapers in Dutch are published. Pop. (1890), 3,945.

HOLLAND, JOSIAH GILBERT, an American journalist and author, born at Belchertown, Mass., July 24, 1819, died in New York city, Oct. 12, 1881. After graduating at Berkshire Medical College, Pittsfield, Mass., he became superintendent of public schools at Vicksburg, Miss. In 1849 Doctor Holland was associate editor of the "Springfield Republican," and later he edited *Scribner's Magazine*.

HOLLIDAYSBURG, the county-seat of Blair county, Pa., on a branch of the Juniata River, and at the junction of several branches of the Pennsylvania railroad. It has furnaces, foundries, rolling-mills, and nail factories. Pop. (1890), 2,975.

HOLLISTER, the county-seat of San Benito county, Cal., 94 miles south of San Francisco. Much tobacco is raised in the vicinity, while coal and quicksilver are found in the surrounding mountains. Pop. (1890), 1,234.

HOLLISTON, a manufacturing town of Middlesex county, Mass., 26 miles southwest of Boston. It produces boots, shoes, nails, wrenches, and pumps.

HOLLINGSHEAD, JOHN, born in London, Sept. 9, 1827. He joined the staff of *Household Words* in 1857; was a constant contributor to that periodical and to *All the Year Round*, the *Cornhill Magazine*, *Good Words*, and *Once a Week*. From 1859 to 1864 he published several volumes of essays and stories, chiefly on life in London. He has written one or two original dramatic pieces, and was for ten years the dramatic critic of the *Daily News*, *London Review*, etc., and is a member of the Dramatic Authors' Society. Mr. Hollingshead opened the Gaiety Theater, in the Strand, in Dec., 1863, and he has only lately ceased to be its lessee and manager. He has had three metropolitan theaters under his direction at one time, with the most powerful combination of actors in London. He has also been the director of the principal theater in Manchester. In 1879 he induced the whole Comédie Française to visit London and play for six weeks at the Gaiety.

HOLLY, a post-village and railroad junction of Oakland county, Mich., 52 miles from Detroit. Ice is shipped from here, the manufactures are furniture, flour, and castings. Pop. (1890), 1,266.

HOLLY SPRINGS, a city, railroad junction and county-seat of Marshall county, Miss., noted for its educational institutions. Rust University and the State normal school and other schools are located here. It is a great cotton shipping point, and manufactures hubs, spokes, wagons, and contains potteries and marble works. Pop. 2,246.

HOLMAN, WILLIAM S., a United States Congressman, born in 1822. He was admitted to the Indiana bar, and from 1843 to 1846 was judge of the court of probate. From 1847 to 1849 he was prosecuting attorney; was a member of the legislature in 1851, and was a judge of the court of common pleas from 1852 to 1856. He was a Democratic member of the successive Congresses from the 36th to the 53rd, except the 45th and 46th.

HOLM OAK, or HOLLY OAK, a beautiful evergreen oak, *Quercus ilex*, native of Southern Europe and Northern Africa. It affords excellent timber.

HOLMES, ABIEL (1763-1837) an American clergyman. In 1783 he became tutor at Yale, and in 1785 was made pastor in Midway, Ga. From 1792

to 1832 he had charge of the first parish in Cambridge, Mass. He wrote *Annals of America* (1805).

HOLMES, GEORGE FREDERICK, an American educator, born in 1820. He was a teacher in Virginia, Georgia and South Carolina, and in 1842 was admitted to the South Carolina bar. In 1845 he became professor in Richmond College, Va.; in 1846 president of Mississippi University; in 1847 professor of political economy, history and international law in William and Mary College, and in 1857 was made professor of history and literature in the University of Virginia. He has written a series of text books used in Southern schools.

HOLMES, OLIVER WENDELL, M.D., was born at Cambridge, Mass., August 29, 1809. He graduated at Harvard College in 1829, and began the study of law, which he abandoned for that of medicine. Having attended the hospitals of Paris and other European cities, he began practice in Boston in 1836; in 1838 was elected professor of anatomy and physiology in Dartmouth College, and in 1847 was appointed to a similar professorship in the Massachusetts Medical School, from which he retired in 1882. As early as 1836 his contributions in verse appeared in various periodicals, and his reputation as a poet was established by the delivery of a metrical essay, entitled *Poetry*, which was followed by others in rapid succession. As a writer of songs, lyrics, and poems for festive occasions, he occupies the first place. He was for many years a popular lecturer. In 1857 he began, in the *Atlantic Monthly*, a series of articles under the title of *The Autocrat of the Breakfast Table*, which were followed in 1860 by *The Professor at the Breakfast Table*; in 1872 by *The Poet at the Breakfast Table*, and in 1885 by *The New Portfolio*. In addition he has published *Astræa* (1850); *Currents and Counter-Currents in Medical Science* (1861); *Elsie Venner, a Romance of Destiny* (1861); *Borderlands in Some Provinces of Medical Science* (1862); *Songs in Many Keys* (1864); *Soundings from the Atlantic* (1864); *Humorous Poems* (1865); *The Guardian Angel* (1868); *Mechanism in Thought and Morals* (1870); *Songs of Many Seasons* (1874); *John L. Molley, a Memoir* (1878); *The Iron Gate and Other Poems* (1880); *Medical Essays* (1883); *Pages from an Old Volume of Life* (1883); *Ralph Waldo Emerson* (1884); *A Moral Antipathy* (1885), and numerous poems recited at various reunions and dinners. In 1886 he visited England, where he was received with great cordiality. Editions of his collected poems have appeared from time to time, the first in 1836, the last in 1881.

HOLST, HERMANN EDUARD VON, a German historian, born in Fellin, Livonia, in 1841, and emigrated to the United States in 1869. In 1872 he became professor of history in Strasburg University, and in 1874 at Freiburg. Subsequently he returned to the United States, and lectured at Johns Hopkins University. He wrote *Louis XIV* (1869); *Verfassung und Demokratie der Vereinigten Staaten von Amerika* (1873); and *The Constitutional Law of the United States of America*.

HOLSTERS, cases for pistols affixed to the pommel of a saddle. They were frequently covered with wool or fur, to prevent injury to the rider in the event of his being thrown forward upon them.

HOLSTON RIVER, a branch of the Tennessee, formed by the north and south forks, which rise in Virginia and unite near Kingsport, Tenn. It flows southwest to Kingston, where it unites with the Clinch. It is about 200 miles in length, and is navigable for light-draft boats the entire distance, and for large steamers to Knoxville during the greater part of the year.

HOLT, JOSEPH, an American jurist, born in 1807.

He was admitted to the Kentucky bar in 1828; in 1857 was appointed commissioner of patents; became postmaster-general in 1859, and in 1860 assumed charge of the war department. In 1862 he was made judge-advocate-general of the army, and in 1864 was put at the head of the bureau of military justice. In 1865 he was brevetted major-general, United States army, for faithful, meritorious and distinguished services in the bureau of military justice during the war, and in 1875, at his own request, was retired.

HOLTON, a city and county-seat of Jackson county, Kan., 56 miles west of Leavenworth. It manufactures flour, and has excellent fruit, good timber and building stone. Pop. (1890), 2,727.

HOLTZENDORFF, FRANZ VON, a German jurist, born at Vietmannsdorf, in Brandenburg, Oct. 14, 1829. Educated for the law, he practiced in the courts at Berlin till 1857, when he became a lecturer on law at the University. Made professor there in 1861, he was in 1873 called to Munich. He is known as an able writer on several branches of law, and especially as an advocate for the reform of prisons and penal systems.

HOLTZMANN, ADOLF, born at Carlsruhe, May 2, 1810, died at Heidelberg, July 3, 1870. He first studied theology at Berlin, then Old German under Schmeller at Munich, and afterwards Sanskrit under Burnouf at Paris. In 1852 he was appointed professor of German language and literature at Heidelberg.

HOLTZMANN, HEINRICH JULIUS, theologian, son of the Germanist Adolf Holtzmann, born at Carlsruhe, May 17, 1832. In 1861 he became extraordinary, in 1865 ordinary, professor of theology at Heidelberg, and in 1874 accepted a call to the theological faculty at Strasburg.

HOLY COAT OF TREVES. See TREVES, Britannica, Vol. XXIII, p. 553.

HOLY CROSS, the name of several orders of the Roman Catholic church, as the Congregation of Canons Regular of the Holy Cross, founded by Theodore de Celles in 1211; Congregation of the Holy Cross, an association of regular clerks, founded by the Abbé Moreau in 1834, and introduced into the United States in 1842. The parent house of this order for the entire world has since been planted at Notre Dame, Indiana.

HOLY FAMILY, the name given, in the language of art, to every representation of the Infant Saviour and His attendants. In the early part of the Middle Ages, when the object in view was to excite devotion, the Virgin and Child were usually the only persons represented. At a later period, Joseph, Elizabeth, St. Anne (the mother of the Virgin), and John the Baptist were included.

HOLYHEAD ISLAND, a small island forming part of Anglesey, Wales, is eight miles long by three and a half broad. It is separated from Anglesey by a narrow strait, crossed by a causeway, along which run the Holyhead road and the Chester and Holyhead Railway. The surface is mostly rocky and barren. On the northwest coast are two islets, the North and South Stacks, the latter with a lighthouse, whose light is seen for twenty miles. Area, 9,658 acres. Population (1893), 10,131.

HOLY LEAGUE, a name applied to various European alliances, as that of 1511, between the Pope, Julius II., Spain and Venice against France, or that of Nuremberg in 1538, between Charles V. and the Catholic princes of Germany against the League of Schmalkald. For the league of 1576 against the Huguenots, see FRANCE, Britannica, Vol. IX, p. 562.

HOLYOAKE, GEORGE JACOB, an English re-

former, born at Birmingham, April 13, 1817. He taught mathematics at the Mechanics' Institute in his native city, acted as secretary to the British contingent that went to the assistance of Garibaldi; was for many years editor of "The Reasoner"; was chiefly instrumental in securing the passage of the bill legalizing secular affirmations, and has taken a prominent part in various public movements. Holyoake was the last person imprisoned in England on a charge of atheism, 1841. He was president of the Carlisle Congress of the Coöperative Societies, 1887.

HOME, DANIEL DOUGLAS, born near Edinburgh, Scotland, March 20, 1833; died June 21, 1886. He came to the United States in 1840. In his youth he claimed to have had spiritualistic visions, and at seventeen years of age published himself as a medium. In 1853 Home went to New York to study medicine. He finished his course, but did not practice. Later he removed to London, where he remained for several years giving spiritualistic seances, and exhibited his art in Russia, Germany, Italy and France. In 1858 he married a Russian lady of wealth and station. In 1863 Home went to Italy to study art, and in 1866 a Mrs. Lyons made over to him \$165,000 with the proviso that he should add "Lyons" to his name. Some years afterward the donor demanded the return of her gift; Home refused compliance, the case came to trial, and was decided in favor of the plaintiff. In 1871 he married another Russian lady, but the union proved unhappy. Thereafter Home gradually retired from public view, and died insane.

HOMEOPATHY. The membership of the American Institute of Homeopathy, on Jan. 1, 1891, numbered nearly one thousand, and represented nearly every State in the Union. The number of new members received during the previous year was 128. At that date the statistical summaries were reported as follows: Number of physicians (variously estimated), 10,000 to 12,500; colleges, 13; students in attendance last year, 1,175; number graduated last year, 369; alumni of 13 colleges, 8,422; professors and lecturers, 254; value of college property, \$750,000; State societies, 29; aggregate membership, 3,080; local societies, 90; aggregate membership, 4,543; hospitals, general and special, 62; total number of beds, 5,897; patients treated last year, 35,242; value of hospital property, \$6,950,700; journals published, 25.

While at one time in Great Britain and on the continent of Europe, homeopathy had fallen into such disrepute that practitioners in that school of medicine were not infrequently denounced as quacks and regarded almost everywhere with suspicion, yet of late years the principles of Hahnemann, its founder, have met with increasing recognition not only by the public, but in professional circles. The later works of Hahnemann have in a measure supported the claim of scientific medical men that he proceeds upon unscientific and involved hypotheses; but his appeal to the lay public met with such a response that the protests of dissentient physicians have been drowned in the general voice of approval. As the literature of homeopathy has increased, a revival of interest in the use of drugs has followed, and during the last twenty years the method of studying the action of drugs originally suggested and carried out by Hahnemann has been adopted to a very large extent, under the designation of pharmacology; while for practical purposes the uses of drugs proposed by homeopaths, and set forth in their journals and published works, have been very largely followed. The United States, however, has been the especial field where homeopathy has been

fostered and encouraged, and mainly on account that in this country public opinion is more powerful than professional jealousy. Here, it is estimated that nearly one-fourth of the qualified practitioners of medicine practice it. The figures given at the head of this article generally evidence its flourishing status.

HOMER, a city of Champaign county, Ill., 273 miles southwest of Toledo, Ohio. It has a flour mill and is a shipping point for fruit and grain. Pop., 917.

HOMER, a railroad junction of Calhoun county, Mich., with a furnace and flour mills. Pop., 1,063.

HOMER, a village of Cortland county, N. Y., 27 miles south of Syracuse. It contains foundries and flour mills. Pop. (1890), 2,500.

HOMER, WINSLOW, an American artist, born in 1836. In 1860 he became interested in painting, and has since devoted his entire attention to that work.

HOMESTEAD, a flourishing town of Alleghany county, Pa., the center of a considerable iron-working industry. Late in the spring of 1892 it was brought into prominence by a bloody riot, growing out of an extended strike of iron-workers, in which several lives were sacrificed. Population (1890), 7,919.

HONDURAS, **BRITISH**, a crown colony on the Caribbean Sea, south of Yucatan, and 600 miles west from Jamaica. Area, 7,562 square miles. Population in 1891, 31,471. Capital, Balize, with a population of 5,800. Balize is noted for its production of mahogany and logwood. Schools (1891), 34; pupils, 2,612 (1,086 Roman Catholic, 1,199 Wesleyan); government grant, \$11,023. Detachments of the 2d West India regiment are stationed in the colony.

Imports in 1890, £282,045; exports, £287,690; revenue, £51,204; expenditures, £45,487.

Chief sources of revenue: Customs-duties, excise, licenses, land-tax, etc.; also sale and letting of crown lands. Expenditure mainly administrative and the various services. Debt (1890), £17,595.

In 1890 mahogany exported 5,500,000 cubic feet; logwood, 20,018 tons; fruit (chiefly to New Orleans), £25,000; sugar, 953 tons. The transit trade greatly increases the traffic of the ports, especially in India rubber, sarsaparilla, coffee, etc. Besides the staple products, mahogany and logwood, there are sugar, coffee, bananas, plantains, cocoa-nuts, etc.

In 1890, tonnage of vessels entered and cleared, 364,067.

Number of letters, newspapers, etc., passed through the post-office, 1887—international, 97,355; inland, 22,697.

Currency, chiefly Central American silver dollars.

HONDURAS, **THE REPUBLIC OF**, was established Nov. 5, 1838, before the dissolution of the confederation of Central America in 1839. It is governed under a charter proclaimed in 1865, greatly modified by the new constitution of Nov. 1, 1880. It gives the legislative power to a congress composed of 37 members. The executive authority rests with a president, nominated and elected by popular vote for four years. Area about 46,400 square miles. Population (1889), 431,917. The capital of the Republic is Tegucigalpa, with 12,600 inhabitants.

The finances of the country are in great disorder, owing to prolonged civil strife, aggravated by wars with Guatemala and San Salvador. The revenue for 1888-89 was \$1,432,522; expenditure, \$1,385,000. The foreign debt of Honduras consists of English loans amounting to £3,222,000 and a French loan of £2,176,670, or a total of £5,398,570. No interest has been paid since 1872, and its accumulation has reached (1891) the amount of over £7,645,518. The finances of Honduras have become fur-

ther complicated by a bloody revolution in the summer of 1892. The disturbed condition of affairs precludes anything like accuracy concerning its exports since 1888, which in that year were valued at \$3,350,664. In 1890, there were 50 post-offices, 1,800 miles of telegraphs, and there is a railway from Puerto Cortez to San Pedro Sula, 37 miles, and an inter-oceanic railway is projected from Puerto Cortez to Amapala on the Pacific. Also a line from Puerto Cortez by the North Coast, through one of the best fruit districts of the Republic.

HONDURAS, **BAY OF**, an inlet of the Caribbean Sea, between Yucatan and Guatemala on the west, and Honduras on the south.

HONES, or **WHETSTONES**, a particular class of stones used for the purpose of sharpening edge-tools, such as knives, scythes, etc. The best are those brought from Turkey; Bohemia is also celebrated for its hones; and excellent ones are found in Persia, in the Hartz Mountains, in Styria, in Spain, Peru, Siberia, and in this country. In Great Britain, several localities yield hone-stones of excellent quality, and none better than the celebrated Water-of-Ayr stone, which is much used for polishing copper-plates, as well as for hones. The Welsh oil-stone or Idwall stone, and the cutler's green-stone, are obtained from Snowdon in Wales; and in the neighborhood of Tavistock, the Devonshire oil-stones are procured. The hones used for sharpening scythes, etc., are usually made of coarse-grained sandstone.

HONESDALE, an important agricultural and manufacturing city on the Lackawaxen River, is the county-seat of Wayne county, Penn. Population, 6,000.

HONEY-BUZZARD, or **BEE-KITE** (*Pernis apivorus*), one of the *Falconidae*, allied to kites and buzzards. It has a thick feathering on the sides of the head down to the base of the bill; it winters in Africa, and breeds in the wooded districts of North Europe, ranging, however, as far east as China and Japan. The honey-buzzard plunders the nests of bees and wasps for the larvæ, and also the honey. The nest is situated on some leafy tree; and the eggs, usually two, are laid in June. The genus includes a few other species.

HONEYCOMB MOTH, or **BEE-MOTH**, a moth of the genus *Galleria*, which infests beehives. There it deposits its eggs, and the larvæ when hatched feed on the honeycomb. There are two broods in the year, and the latter pupæ sleep through the winter. The best known species are *G. Ceranea* and *G. alvearia*. It appears that neither moths nor larvæ are ever stung by the bees. When they occur in numbers they are very injurious or even quite fatal to the hive.

HONEY-DEW, a viscid, saccharine exudation, often found in warm, dry weather on the leaves and stems of trees and herbaceous plants. It is often, but not always, associated with the presence of insects which feed on the juices of plants, and its flow is ascribed to their punctures; but the rupture of the tissues from any other cause seems also to produce it, and warm dry weather seems to produce in the sap that superabundance of sugar which is thus thrown off. Aphides themselves exude a fluid called honey-dew, which probably differs considerably from the direct exudation of the plant, but mingles with it where they abound. Different kinds of manna are the dried honey-dew of certain plants. But generally this exudation, as it dries, coats the surface of leaves and branches with a clammy film, on which molds and other small fungi soon grow, and thus the pores of the plant are clogged and its health is impaired. Gardeners are therefore careful

to wash off honey-dew. Orange and lemon plantations sometimes suffer great injury from the abundance of honey-dew, as have the coffee plantations of Ceylon.

HONG-KONG, a crown colony of Great Britain, and formerly a part of China. For history, government and early statistics, see *Britannica*, Vol. XII, pp. 141, 142. The latest reported official census was that of 1881; but an estimated census of Dec. 31, 1889, gave the following figures: Area, 29 square miles. Population, 194,482. Of the colored population there were 130,168 Chinese, one-third of the latter being British subjects by birth. The governor has an annual salary of \$32,000, including a "table allowance" of \$7,000. In 1889 there were 106 schools (subject to government supervision) with 7,659 pupils, involving an annual expenditure of \$53,902; also 107 private schools, with 2,022 pupils. The revenue in 1889 amounted to \$1,823,549, and the expenditure to \$1,459,167; the public debt, to about \$1,000,000. There was an imperial garrison of 1,300. Hong-Kong is the headquarters of the China squadron, consisting of 25 vessels in 1890. The number of vessels entering that port in 1889 was 3,820 of 451,864 tons.

HONOLULU, the capital of the Hawaiian or Sandwich Islands, is situated on the southern coast of the island of Oahu. It is at once the seat of government and the commercial center of the Hawaiian kingdom; but it was not originally the capital, and its importance is of modern growth, being due to the fact that its harbor is the only really well-protected port in the Archipelago. See *HAWAII* in these Revisions and Additions.

HOOD, JOHN BELL, an American general, was born at Owingsville, Kentucky, 1st June 1831, graduated at West Point in 1853, and saw some service against the Indians. He entered the Confederate army, commanded a brigade, and was severely wounded at Gaines's Mill, at Gettysburg, and at Chickamauga, where he lost a leg and was made lieutenant-general. He commanded a corps under General J. E. Johnston in the retreat to Atlanta, and in July 1864 succeeded him in command of the army. On September 1 he was compelled to evacuate the city, and leave the road free for Sherman's march to the sea. He yet made a bold attempt to cut Sherman's communications, and, though worsted at Franklin on November 30, pushed as far north as Nashville; but here he was again defeated by Thomas on December 16, and at his own request he was relieved of command. He died in New Orleans, 30th August, 1879. His personal experiences were published posthumously as *Advance and Retreat* (1880).

HOOK, JAMES CLARKE, an English painter, was born in 1819. He commenced his artistic career by painting pictures based on Scriptural and poetical subjects. Afterwards he produced many excellent paintings, whose subjects were pastoral or modern. In 1860 he was elected a Royal Academician. Consequently upon the success of his well known *Luff, Boy!* Mr. Hook has more recently devoted his talents to marine pictures, and is a regular contributor to the Royal Academy. Three paintings by Mr. Hook attracted much admiration at the academy in 1890.

HOOKAH (from Arabic *huqqa*, through the Hindustani; the Persian *kalyun*; also called Nargileh, from Persian *nārgil*), the water tobacco-pipe of Arabs, Turks, Persians, Hindus, and other Orientals. It consists of a bowl for the tobacco, a water-bottle, and a long flexible tube ending in the mouthpiece. A wooden tube leads from the bottom of the head or bowl down into the water in the bottle, and the flexible tube is continued down-

wards by a stiff tube into the space above the water in the bottle. Thus the smoke is cooled before it reaches the mouth of the smoker. Many of these pipes are beautifully decorated, or even encrusted with gems. The *hubble-bubble* of India (named from the sound produced) is a similar but simpler water-pipe, made of a cocoanut filled with water, and two short wooden tubes at right angles, one going into the water, the other merely passing inside the top of the shell.

HOOKER, CHARLES E., a United States Congressman, born in South Carolina. After he was admitted to the bar he removed to Mississippi. In 1850 he was elected district attorney of River district, and to the legislature in 1859. In 1865 he was made attorney-general of the State, and reelected in 1868. He was elected to the 44th, 45th, 46th, 47th, 50th, 51st, 52d and 53rd Congresses as a Democrat.

HOOKER, SIR JOSEPH DALTON, a son of Sir W. J. Hooker (1785-1865), was born at Halesworth, in Suffolk, June 30, 1817, and was educated at the High School and University of Glasgow, graduating M.D. in 1839. He soon afterward joined the antarctic expedition of the *Erebus and Terror* . Returning after four years' absence, he acted for some time as substitute for Professor Graham in the chair of botany at Edinburgh University; in 1846 was appointed botanist to the geological survey of Great Britain, and in the following year undertook a botanical expedition to the Himalayas, which occupied him for three years. In 1871 he made an expedition to Morocco, ascending the great Atlas, the summit of which had never before been reached by a European. In 1877 he accompanied Doctor Asa Gray in a scientific tour through Colorado, Utah and California.

During this visit he was most cordially received by the leading scientific men of America. On his return he presented to Kew a large collection of seeds and museum specimens, and a herbarium of about a thousand species, together with notes on the distribution of North American trees in particular. In 1854 he was awarded a gold medal by the Royal Society. In 1884 the founders' medal of the Royal Geographical Society was awarded to Sir Joseph Hooker "for his eminent services in scientific geography," and in 1883 the Society of Arts presented to him their Albert medal for the services he has rendered to the arts, manufactures and commerce by promoting an accurate knowledge of the flora and economic vegetable products of the several colonies and dependencies of the empire.

Sir Joseph Hooker has published a number of valuable works, of which one of the best known is *Students' Flora of the British Islands*, and the most important, the *Genera Plantarum* in conjunction with George Bentham (3 vols. 1862-83). He has been a president of the Royal Society.

HOOKER, THOMAS, one of the founders of Connecticut, was born at Markfield, Leicestershire, in 1586, studied at Cambridge, and became a Fellow of Emmanuel College, and was for four years a curate at Chelmsford. Ejected for nonconformity, he lived in Holland until 1633, when he went to Massachusetts, and received a charge at Cambridge. In 1636 he removed with his congregation to Connecticut, and founded the town of Hartford, where he died, July 7, 1647.

HOOKER, WORTHINGTON (1806-67), an American physician. In 1829 he began the practice of medicine in Norwich, Mass., and from 1852 to his death was professor of the theory and practice of medicine in Yale.

HOOKS AND EYES. These dress fasteners were formerly made by hand, but for many years they have been made by machine. By one kind of

machine the wire is first drawn off a reel, next cut to the required length; then by a sinker forced into a slot, by which it is bent, and at the same time the two ends are formed by cams into the lateral loops. A hook requires an additional bend, and this is produced by another slot and sinker.

HOOK-SQUID, one of the cephalopod mollusks of the family *Onychoteuthidæ*, remarkable for its long hooked tentacles and suckers, which are employed to seize its prey. It sometimes attains a length of six feet, and is much dreaded on account of its voracious habits. It ranges through most seas.

HOOPSTON, a village of Vermilion county, Ill., situated at the junction of the Chicago, Danville & Vincennes Railroad, with the Bloomington division of the Wabash Railroad, 104 miles south of Chicago. It has elevators and considerable traffic in grain.

HOOSAC RIVER rises in Lanesboro, Berkshire county, Mass.; flows north, crosses a corner of Vermont northwest into New York, entering the Hudson about 14 miles above Troy. It affords considerable water-power, and in New York is called Hoosick River.

HOOSICK FALLS, a village of Rensselaer county, N. Y., 26 miles northeast of Troy. It has manufactories of lumber and mowing machines, and contains malleable iron works. Pop. 7,014.

HOPE, a post-village and railroad junction of Hempstead county, Ark., situated 112 miles from Little Rock, and 33 miles from Texarkana, on the St. Louis, Iron Mountain & Southern Railroad.

HOPE-SCOTT, JAMES, third son of the Honorable Sir Alexander Hope, and grandson of the second Earl of Hopetoun, born at Marlow in 1812, died in London, April 29, 1873. He was educated at Eton and at Christ Church, Oxford, and, admitted to the bar in 1838, soon made a great parliamentary practice. His life, by Robert Ormsby (2 vols., 1884), is specially interesting for the glimpses it gives of men greater than himself, as Cardinal Newman and Mr. Gladstone.

HOP-FLEA, or **TOOTH-LEGGED BEETLE** (*Phyllotreta*, or *Haltica confinna*), a very small coleopterous insect, which often in the spring devours the tender tops of young shoots in hop plantations. It is of the same genus as the turnip-fly (*Phyllotreta nemorum*).

HOP-FLY (*Aphis*, or *Phorodon humuli*), a species of aphid, or plant-louse, important on account of the injury it inflicts on the hop plantations. The general color is pale-green. Both larvæ and adults ruin the plants. No efficient method of preventing the ravages of this pest has yet been discovered; but the beneficial service to man of lady-birds and other natural foes of this fly has been long and widely recognized.

HOPKINS, ALBERT J., a United States Congressman, born in 1834. He was admitted to the Illinois bar, and began practice in Aurora, Ill. From 1872 to 1876 he was State's attorney of Kane county, and from 1878 to 1880 was a member of the Republican State central committee. He was elected as a Republican to the 49th, 50th, 51st, 52d and 53d Congresses.

HOPKINS, EDWARD (1600-57), an English statesman. He emigrated to Boston, Mass., in 1637, and shortly afterward removed to Hartford. From 1640 to 1664 he was governor of the colony every even year, alternating with John Hayes. He then returned to England and became warden of the fleet, commissioner of the admiralty, and member of parliament. At his death he left \$3,500 to educational institutions in New England.

HOPKINS, ESEK (1718-1802), an American naval officer. In 1775 he was commissioned by the Continental Congress commander-in-chief of the navy,

and in February of the following year, put to sea with the first squadron sent out by the colonies. He was officially complimented for his success in several engagements, but in 1777 was dismissed from the service for neglecting a citation to appear in Philadelphia. Subsequently he settled in Rhode Island, and several times was chosen a member of the general assembly.

HOPKINS, JOHN HENRY (1792-1868), an American P. E. bishop. In 1818 he was admitted to the Pennsylvania bar, and gained an immense practice, but five years later became a priest in the Protestant Episcopal church. In 1832 he was made bishop of Vermont. He was the author of numerous works on theological and social issues, his latest essay, *The Pope Not the Antichrist*, being published in 1868.

HOPKINS, JOHNS, philanthropist, and famous for his princely gifts for educational purposes, was born in Anne Arundel county, Md., in 1795, of Quaker parents. He acquired a gigantic fortune in business pursuits and determined to devote a large portion of it to philanthropic uses during his lifetime. In 1873 he founded a hospital in Baltimore with princely endowments, devoting in all \$4,500,000 to that institution, which by the terms of its establishment was made free to all, independent of race or color. By will he gave \$3,500,000 to found the Johns Hopkins University, one of the most complete educational institutions in the country. Mr. Hopkins died in Baltimore, Dec. 24, 1873.

HOPKINS, MARK (1802-87), an American educator. In 1830 he accepted the professorship of moral philosophy and rhetoric at Williams College, and from 1836 till he resigned in 1872 was president of the college. He retained the pastorate of the college church until 1883.

HOPKINS, STEPHEN (1707-85), a signer of the Declaration of Independence. He was a statesman of high rank, and held numerous important public offices. For many years he was a member of the Rhode Island assembly; was justice of the peace, and judge of the court of common pleas; was governor of the colony, and was a member of several congresses. He wrote *History of the Planting and Growth of Providence* (1765).

HOPKINSON, JOSEPH (1770-1842), an American jurist. In 1791 he was admitted to the Pennsylvania bar, and in 1814 was elected a representative to Congress. In 1828 he was appointed United States Judge for the eastern district of Pennsylvania. Mr. Hopkinson was the author of the national song, *Hail, Columbia*.

HOPKINSVILLE, a city and county-seat of Christian county, Ky., situated 71 miles northwest of Nashville, Tenn. The locality is very fertile, and produces tobacco, coal and iron. The city contains South Kentucky College, two seminaries, a State insane asylum, and manufactories of carriages and plows. Pop. (1890), 5,833.

HOPLEGNATHIDÆ, a family of acanthopterous fishes, limited, so far as known, to the single genus *Hoplegnathus*. It is characterized by having a continuous lateral line, perfect ventral fins, and intermaxillary and maxillary bones provided with a trenchant edge, with which the teeth are continuous. Several species are known as inhabitants of the Pacific Ocean.

HOPPIN, JAMES MASON, an American educator, born 1820. In 1842 he graduated at Harvard Law School, and in 1845 from Andover Theological Seminary. From 1850 to 1859 he was pastor of the Congregational church at Salem, Mass., and two years later became professor of homiletics in Yale. He was the author of a great number of theological works.

HORE, ANNIE BOYLE, wife of Edward Coode Hore, was born in Bloomsbury, London, April 8, 1853. In 1882 she commenced her travels in Central Africa, her first journey being from Saadani to Mambria, 200 miles inland. In 1884 she attempted to reach Tanganyika by the Nyasso route but was compelled to return, owing to the war between the Portuguese and the natives. A month later she joined her husband at Delagoa Bay, and together they reached lake Tanganyika via Ujiji and Unyamwezi. She was the first white woman to reach Tanganyika. She spent four years on Kavala Island, teaching children the rudiments of Christianity and civilization. Mrs. Hore has written an entertaining book of travels *To Lake Tanganyika in a Bath Chair*.

Captain Hore is the author of *A Boat Journey Across Africa* and *A Ray of Light in the Dark Continent*.

HORODENKA, a town of Austria, in East Galicia, a hundred and six miles southeast of Lemberg. Population, 10,226.

HOROLOGY, the science which treats of the construction of apparatus for measuring and telling the time. On the construction of ordinary clocks, see *Clocks*, in *Britannica*, Vol. VI, pp. 13-35; and on the construction of ordinary watches see *Watch*, in *Britannica*, Vol. XXIV, pp. 394-98. The improvements in the escapement and the pendulum of the clock bring the mechanical perfection of this time keeping instrument to the point which it has attained at the present day. But the

HORE, EDWARD COODE, an English seaman and traveller, was born in Islington on July 23, 1848. He was of Cornish parentage. He was apprenticed, at the age of sixteen, to the owner of a London ship and visited nearly every part of the world. He rose to the rank of captain. In March, 1877, Captain Hore was appointed to the London Missionary Society's pioneer expedition in Central Africa. He lived on the shores of Lake Tanganyika for about ten years, surveyed its coast line in a little log canoe and discovered the Lukuga to be the true outlet of the lake. He returned to England in 1882 to report upon his work. In 1882 he took the sections of a steel lifeboat, on trucks, from Saadani to Ujiji, a distance of 836 miles, in less than 100 days. In 1888 he finished the building of the steam yacht, "The Good News," on Lake Tanganyika. Captain Hore received a gold chronometer from the Government of the French Republic for attention and assistance to the late Abbé Debaize; and, in 1890, received the Cuthbert Peek grant from the Royal Geographical Society.

art of horology would be incomplete unless there were some standard, independent of individual mechanical contrivances, by which the errors of each may be daily corrected. This standard is supplied by observatories. The big Naval Observatory at Washington determines, and gives away to any one who chooses to ask for it, absolutely correct time at noon each day. Experts paid by Uncle Sam make the computation and press a button at precisely 12 o'clock, thus communicating the hour to the various departments in the city. The Western Union Telegraph company is permitted to have its instruments in the room whence the message is sent, with an attachment to the button, so that the news is flashed directly from the observatory, without even the aid of an operator, all over the United States, reaching even so distant a point as San Francisco within the space of not more than one-fifth of a second—for such is the time usually required for the passage of an electric spark through 3,000 miles of wire. To accomplish this the telegraph company is obliged to take all

other business off the wires, each day just before 12 o'clock. Three minutes and a half before noon arrives, operators in all parts of the country cease sending or receiving messages and devote their attention to attaching wires in such a manner as to establish unbroken connections from Washington with points in every section of the Union to which the lines extend their ramifications. A dozen seconds before the time-bell is to strike, a few warning ticks come flashing along, and at the very moment when the sun passes over the seventy-fifth meridian a current gives a single throb from Maine to Florida, and from the Atlantic to the Pacific, informing an expectant nation of the time of day. The noon signals sent out from Washington serve to indicate 11 A. M. for Chicago, 10 A. M. for Omaha, and 9 A. M. for San Francisco. In this manner the Western Union Telegraph Company keeps corrected by electricity to absolute solar-time not less than 7,000 clocks in the city of New York alone, and in all the United States perhaps as many as 70,000. As each clock is charged \$15 a year for this service, the company derives an income of about one million of dollars from this source. The clocks that are set every noon in a thousand cities and towns by a single pressure of a button in Washington are equipped with a peculiar electrical contrivance by means of which the galvanic current passing through it springs the hands of each time-piece simultaneously to the point of 12, if in the eastern time-belt; to the point of 11, if in the central time-belt; to the point of 10, if in the mountain section; and to the point of 9, if in the Pacific section. The United States Government avails itself gladly of this chance to extend the courtesies of the hour to 63 millions of people, especially in all important seaport towns, where the noon time balls are dropped in order that the mariners may be able to correct their chronometers. This last was from the start the prime object of the entire service. The Naval Observatory does not reckon its time by the sun, but by the fixed stars, which are so far off that their position with relation to the earth does not change appreciably within a few months or even years. Star-time is therefore, the only true time. The operator looks through his large telescope and watches for a given star which he knows to cross the plane of the 75th meridian west of Greenwich. Its time was adopted for the District of Columbia by act of Congress, approved March 13, 1884. The observer has a star-time clock and a printed table that shows him at what second the star in question must actually have crossed the meridian. He corrects the observed time, if necessary, by the table, which is always correct, and reduces it to sun-time. Since the star-year is one day longer than the sun-year, the reduction of the star-time to sun-time requires considerable figuring. A sun-time or "standard" clock stands close by, and by the amount that this varies from the calculated or true sun-time, the clock indications are at once changed. The noon-stroke is sent all over the country according to this corrected sun-time. At the observatory all the chronometers made for the navy are tested and regulated before they are sent out on vessels. It takes 21 weeks of testing to properly regulate and prove one of them. A part of the trial consists in subjecting the instrument to the action of cold in an ice-box, and again to heat as communicated through steam-pipes. Each chronometer, when given out to the navy, is accompanied by a chart telling just how much it will vary under certain temperatures.

THE NEW STANDARD OF TIME IN THE UNITED STATES is established in the following way: The

country is divided into four "time-belts," based on the 75th, 90th, 105th and 120th degrees of longitude. This makes just an hour's difference in clock-time between any two nearest ones of the four meridians mentioned. On each side of these lines the same clock-time extends for about $7\frac{1}{2}$ degrees longitude. This plan went into effect Nov. 18, 1883. The change to this new standard caused but unimportant differences anywhere, save in places where two belts meet. Thus, in Pittsburgh, Pa., a passenger coming into the city on a train from the east and going directly west, should his train leave immediately, will find that there is just one hour's difference in clock-time or train-time between the moment of his arrival and that of his departure; while in fact there is not a minute's difference of real time. His watch will be an hour ahead of the time used on his departing train. On going east his watch will be an hour behind, as an hour can be more easily reckoned than an uneven number of minutes.

This plan of dividing the country into belts about 15° wide is more practicable than it would be to divide it into narrower belts. Besides, a passenger from Portland, Me., to Charleston, S. C., for instance, or from Chicago to New Orleans can make the entire run without changing his watch. This division into hour-belts has been adopted by all important cities, and by the railroads throughout the United States.

1. The following cities have noon at the same moment: Albany, N. Y.; Augusta, Me.; Baltimore, Md.; Bangor, Me.; Boston, Mass.; Brooklyn, N. Y.; Buffalo, N. Y.; Burlington, Vt.; Charleston, S. C.; Cleveland, O.; Concord, N. H.; Hartford, Conn.; New Haven, Conn.; New York, N. Y.; Philadelphia, Pa.; Pittsburgh, Pa.; Portland, Me.; Providence, R. I.; Richmond, Va.; Savannah, Ga.; Washington, D. C.; Wilmington, N. C.

2. When the cities mentioned under 1 have noon, the following have 11 o'clock, A. M.: Atlanta, Ga.; Chicago, Ill.; Cincinnati, O.; Columbus, O.; Detroit, Mich.; Dubuque, Iowa; Galveston, Texas; Hannibal, Mo.; Indianapolis, Ind.; Kansas City, Mo.; Little Rock, Ark.; Louisville, Ky.; Memphis, Tenn.; Milwaukee, Wis.; Minneapolis, Minn.; Mobile, Ala.; Nashville, Tenn.; New Orleans, La.; Omaha, Neb.; Pensacola, Fla.; Quincy, Ill.; St. Joseph, Mo.; St. Louis, Mo.; St. Paul, Minn.; Terre Haute, Ind.; Vicksburg, Miss.

3. When the cities mentioned under 1 have noon, the following places have 10 o'clock, A. M.: Denver, Col.; Salt Lake City; Utah City, Utah; Santa Fé, New Mexico; and

4. The following cities have 9 A. M.: Boise City, Idaho; Portland, Oreg.; San Diego, Cal.; San Francisco, Cal.; Seattle, Wash.; Virginia City, Nev.

The boundary lines of the time-belts coincide with the lines of the meridians only in a very general way. In the accompanying map the three heavy and irregular north and south lines are these dividing lines. The one dividing the eastern and central belts passes through Detroit, Mich., Buffalo, N. Y., Pittsburgh, Pa.; through the western portions of Virginia, West Virginia and North Carolina to the city of Atlanta, Ga., and thence eastward to Charleston, S. C. The boundary line between the central and mountain belts runs nearly due southward through Bismarck in North Dakota to Dodge City in Kansas; and thence south-westward to El Paso, Texas. And the dividing line between the mountain and Pacific belts runs along the boundary line between the States of Montana and Idaho, thence due south to Ogden, Utah; and thence to Yuma, Arizona, at the head of the Gulf of California.

HORNBY, SIR GEOFFREY THOMAS PHIPPS, an English naval officer, was born in 1825, entered the navy in 1837 and was present as a midshipman at the bombardment of Acre. He commanded the first flying squadron as captain, taking it around the world. He succeeded Admiral Wellesley as rear-admiral, attaining flag rank in 1869. He was commander in chief of the naval forces in the Mediterranean in 1878, when war was imminent between England and Russia. He was a lord of the admiralty under Lord Beaconsfield's administration. He was appointed president of the Royal Naval College, at Greenwich, for a term of three years. He was created a knight commander of the Bath. He is at present retired from active service.

HORNBY, JAMES JOHN, D.D., was born in England in 1826, and educated at Eton, and at Balliol College, Oxford, where, in 1849, he took a first-class in classics. In 1849 he became a fellow of Brasenose College, and in 1854 tutor and principal of Bishop

Cosen's Hall in the University of Durham. Returning to Oxford in 1864, he became classical lecturer at Brasenose, and in 1866 was senior proctor of the university. At the close of the latter year he was elected second master of Winchester School, which post he retained till his appointment as head master of Eton in January, 1868. Doctor Hornby was appointed one of her majesty's honorary chaplains in February, 1882, and made D.C.L. of Durham University the same year. He was appointed to the provostship of Eton, July, 1884.

HORSE (*Equus*), an ungulate or hoofed mammal of the order Perissodactyla, characterized by having an odd number of toes; the family Equidae formed the group Solidungula of old writers, owing to the presence of only a single hoof, which marks them off quite sharply from all allied animals. The English name is found in Anglo-Saxon as *hors*, and is cognate with the Icelandic *hross*, German *ross*; it is sometimes referred to Sanskrit root *hresh*, "to neigh," but, according to some, with more probability, to a Teutonic root *har*, "to run," cognate with Latin *currere*. The Latin name is no doubt from the root *ak*, conveying the idea of swiftness; Sanskrit *akva*; Gr. *hippos* or *hikkos*; Lat. *equus*.

The explorations of the Russian traveler, Przhevalski (Prejevalsky), in 1881, added another species to the list of Asiatic forms, which has been called after him. The long hairs of the tail begin only half-way down it; the mane is short and erect, and there is no forelock; the head is large and heavy; the ears smaller than those of the ass. It inhabits the dry sultry regions of the Dzungarian Desert, living in companies of fifteen to twenty, each led by a stallion. Only two herds were observed, and only one specimen was secured. The resemblance which this species presents to the horse of early sculptures has been pointed out by several observers.

The senses of the horse are acute, though many animals excel it in this respect; but its faculties of observation and memory are both very highly developed. A place once visited or a road once traversed seems never to be forgotten, and many are the cases in which men have owed life and safety to these faculties in their beasts of burden. Even when untrained it is very intelligent; horses left out in winter will scrape away the snow to get at the vegetation beneath it, which cattle are never observed to do. Perhaps this may be inherited from their ancestors in the Siberian plains; but curiously enough the very same habit is observed in the horses of the Falkland Islands, whose ancestors in La Plata could have had no occasion to show the same instinct for many generations back.

With patience and kind treatment the horse can be trained to go through quite complicated feats of memory and perception. That it possesses also an accurate sense of time is clear from the facility with which it can be taught to walk, trot, and dance to music, or take part in concerted evolutions. Its knowledge of tunes is evinced by its comprehension of military signals. It is very timid and cautious and suspicious of every new sight or sound; while in respect to moral qualities it is scarcely too much to say that horses are as diverse as men.

The history of the horse can be traced back, though with extensive gaps, to the beginning of the Tertiary geological period, where we find the remains of a small ungulate no larger than a fox, to which the appropriate name *Eohippus* has been given. It was of very generalized structure, having for example four complete toes and a rudimentary fifth on the fore-feet. In Miocene times it was

succeeded by *Miohippus* and *Anchitherium*, which in their turn gave place to the Pliocene *Hipparion* and *Pliohippus*, each of these showing an increase in size and a closer approach in structure to the modern horses. The history of the feet in particular furnishes one of the best examples we know of the gradual evolution of a specialized from a more generalized organ. The skull and neck became coincidentally more elongated, and the teeth underwent changes which have been already alluded to.

The etymological synopsis above given shows that the horse was known to the Aryan people before their dispersal. Incised figures of the horse upon bones have been found in cave-deposits referred to the Palaeolithic age, and there is evidence to show that at this period the animal was an object of the chase and a source of food. It was probably small and heavy, with a large head and an upright or hog-mane; and attention has been already called to the resemblance which some of the sculptured figures of antiquity bear to the *Equus przewalskii* above described.

The horse reappears in Neolithic remains in the Swiss lake-dwellings and elsewhere, but here apparently still as an object of the chase. The precise date of its domestication is uncertain. On Egyptian monuments no trace of it appears before the expulsion of the Hyksos or shepherd kings; and it is generally stated that the animal was previously unknown to the Egyptians, though it can hardly be considered as proved that it was introduced by the Hyksos.

In Scripture the horse is only referred to in connection with warfare; witness the poetic description of the war horse in the Book of Job. The earliest mention of the animal in Holy Writ occurs in connection with the famine in Egypt, when Joseph gave the people corn in exchange for their horses; and its use for riding is alluded to in 2 Kings, xviii, 23.

In Homeric times the horse was not used for riding; indeed, at the battle of Marathon (490 B. C.) the Persians, but not the Greeks, used cavalry. After 450 B. C., however, the art was practised in Greece, and a treatise upon it, of somewhat later date, from the pen of Xenophon, still exists. The war horses of the Britons and the chariots, their wheels armed with scythes, are described by Cæsar. Athelstan paid special attention to the breed of English horses, and even imported animals from Spain for its improvement. In this he was followed by other monarchs, as John and Edward III. In the reign of this latter king a law was passed forbidding the exportation of horses, and a number of Spanish jennets were introduced. Henry VIII. made various enactments for improving the condition of the English horse, particularly relating to the pasturing of entire horses upon commons and open lands, where a good deal of promiscuous and detrimental breeding had taken place. In the reign of Elizabeth it was penal to make over a horse "to the use of any Scottishman," a prohibition naturally repealed by her successor, who further signaled himself by bringing over to England the "Markham Arabian," believed to have been the first of that breed introduced. He did not prove a success; but still the experiment was repeated from time to time, and in William III.'s reign the "Byerly Turk," the first of a celebrated trio, was brought over to England. At the very beginning of the 18th century came the "Darley Arabian" (the sire of Flying Childers, 1715), and later the "Godolphin Arabian," or Barb (1724-53). The first of these was the great-grandfather of the celebrated racer "Eclipse" (foaled

1764), from whom so many winners of important races have descended. Indeed, it is not too much to say that from one or other of these horses, in most cases from all three, all horses at present on the turf trace their descent in the male line. Since the commencement of the 19th century an accurate record has been kept of the descent of all race-horses, and an attempt has been made to carry the history about a century further back.

There has been much discussion and speculation as to the kind of animal from which the domestic horse has been derived. Colonel Hamilton Smith supposed that the modern breeds have descended from about five primitive differently-colored stocks, but this view finds no supporters nowadays; rather it is maintained that "the similarity in the most distinct breeds in their general range of color, in their dappling, and in the occasional appearance, especially in duns, of leg stripes and of double and triple shoulder-stripes, taken together, indicate the probability of the descent of all the existing races from a single, dun-colored, more or less striped primitive stock, to which our horses still occasionally revert."

Whether the actual species thus alluded to is still living in the wild state is extremely uncertain; indeed it is held by many competent judges that no primitively wild horses now exist, the herds of horses that roam over the Russian steppes being supposed to be the descendants of animals which were once domesticated, and have relapsed into the feral state, as is known to be the case with the mustangs of South America.

The Tarpan, or wild horse of southern Russia, is a small animal, with thin, but strong, long-jointed legs, longish thin neck, and comparatively thick head, pointed ears directed forwards, and small vicious eyes. The coat in summer is close, short, and wavy, especially behind; in winter it is thick and long, forming a kind of beard under the chin; the mane thick and bushy, the tail of moderate length; the color generally pale brown or yellowish in summer, almost white in winter. It is found in southern Russia, but (according to Radde) is absent from Central Asia, even from the north of the Gobi, where the dziggetai is found. It lives in large herds, often numbering several hundreds, subdivided into little groups or families, each presided over by a stallion, who protects his retinue valiantly, but permits no irregularities in their behavior; young horses keep at a distance on the outskirts of the herd until they are able to undertake the cares of a family for themselves. The stallions are ever on the alert with nose and ear to detect the approach of danger, of which they give notice by a loud neigh, upon hearing which the whole herd takes to flight, sometimes disappearing as if by magic from the crafty manner in which they take advantage of irregularities in the ground. The story that they protect themselves by forming a ring with heads directed inwards has no foundation in fact, although the stallions will defend the mares and foals from impending attack. The stallions fight vigorously among themselves with teeth and hoofs, and each as he attains maturity must win his position in the herd by a series of duels. They present all the appearance of truly wild animals, and are regarded as such by the Tartars and Cossacks, who destroy them on all possible opportunities, because they are useless for taming purposes, and because they inflict considerable damage upon these horse-rearing communities by devouring their stores of hay and enticing away their mares.

The South American wild horses, known as "cimarrones" or "mustangs," are reported by Azara to

be the descendants of some half-dozen individuals which were left to their own resources when the town of Buenos Ayres was abandoned about 1535. When in 1580 the town was reinstated, they were found to have increased to a very considerable number. They are of the same size as the domestic horses, but with thicker heads and legs, and longer necks and ears; all are brownish or blackish in color. Their social system is the same as that of the Tarpans. They proceed in Indian file, leaving no gaps in the series, and are avoided by travelers, owing to their attempts to entice tame horses into their company, not unfrequently with success. The Indians on the pampas eat the mares and foals, and also capture a certain number in order to tame them; but the Europeans make no use of them, except perhaps to kill one when fuel is scarce in order to replenish the camp-fire with its marrow. The accounts given by travelers of these animals differ in many important particulars.

The subject of the horse's paces is one which has given rise to much controversy. It has been maintained that horses in a wild state use only the walk and gallop, the trot and others being the results of education. This question can hardly be regarded as settled even now, for the fact that quite young foals have been observed to trot beside their dams is explicable as an instance of heredity.

Six well-marked paces may be distinguished in the movements of domesticated horses—the walk, the amble, the rack or pace, the trot, the canter, and the gallop. The study of the precise movements of the different limbs in carrying out these paces is very difficult, especially in the case of those in which the motion is rapid. Marey, the French physiologist, was the first to attempt a rigorous analysis of these movements by means of apparatus.

He attached to the horses' hoofs small elastic bags, connected by tubes with pointers, which made marks upon a revolving cylinder. When any one of the feet touched the ground the bag was compressed, and the pointer instantly made a corresponding mark upon the cylinder. Very valuable results were obtained by this method of study; but they need not be further detailed here, as they have been superseded by the beautiful photographic investigations of Muybridge. In these experiments the horse was made to proceed along a track in front of a row of twelve or twenty-four cameras, so arranged that, as the animal passed in succession before each of them, an instantaneous photograph of it was obtained. These pictures furnish the means of analyzing the various paces, as the exact attitude of the horse is shown at very short intervals of time. In the case of an ordinary walk the horse has always two and sometimes three feet on the ground at once. The order of the succession of the footfalls is as follows: left hind, left fore, right hind, right fore; furthermore the horse is alternately supported by the two feet of the same side (laterals) and by a hind and a fore foot of different sides (diagonals); when the animal rests upon the laterals, the suspended feet appear in a side view between the supporting feet; when upon the diagonals, the suspended feet hang out one in front of and the other behind the supporting feet. These rules furnish the means of testing the accuracy of artistic representations of walking horses. The amble is a rapid walk, the length of time the feet rest upon the ground being reduced so that the body is often supported upon only one foot, and generally only on two. The rack, or, as it is called in America, the "pace," is a step but rarely seen; in it the laterals move synchronously with each other, so that a horse performing this action has been aptly compared to two men running one behind the

other and keeping step. The trot has been defined as a pace characterised by the synchronous movement of the diagonal limbs, though in practice the movement is rarely, if ever, quite simultaneous. It has often been maintained by experienced horsemen that a horse in trotting has always at least one foot in contact with the ground. So far, however, is this from being the case, that a fast trotter is quite unsupported for more than half the distance he traverses in each stride. In the canter the order of the footfalls is the same as in the case of the walk, and the characteristic difference is due to the peculiar rhythm as well as to the final effort which propels the body at the conclusion of the stride as the fore-leg leaves the ground.

Recently much attention has been paid in America to the trotting horse, the track and the sulky. The kite-shaped track and the light sulky with pneumatic tire have added much to the reduction of trotting time. The best time made up to Dec. 31, 1892, was a mile in 2:04 by Nancy Hanks. It is expected soon to reach two minutes, a time once deemed impossible. See *Britannica*, Vol. XII, p. 172.

HORSEHEADS, a town of Chemung county, N. Y. It contains a woolen mill, saw mill, and a very large brick-yard. Population (1890), 1,716.

HORSE ISLAND, an island in Lake Ontario, and in Jefferson county, N. Y., two miles from Sackett's Harbor. It has a light-house. Area, 27 acres.

HORSE-POWER. The word *power* is of frequent use as a scientific expression. Thus we speak of steam-power, water-power, and so on. When used in this sense it is quite obvious that reference is merely made to the nature of the store of energy in the particular motor under consideration. Again, when we speak of the total energy of a given system as the total power that it has of doing work, it would seem to be almost an insult to the mental power of our auditor to tell him in addition that by the latter phrase we mean simply total work measured in terms of any convenient unit. But it is often necessary to know the quantity of work which can be produced in a given time by a given motor. It is in this connection that the term *horse-power* is used to denote the rate at which, on the average, a horse can do work per unit time, and this rate is adopted in Britain as the unit rate of working. Estimates of its numerical value necessarily differ very much; and so, in order to get a definite unit available for scientific purposes, the convention is made that the original estimate of Boulton and Watt shall be regarded as correct. The value which they gave was 33,000 foot-pounds per minute.

An ordinary rule for calculating the horse-power of a steam-engine is to divide by 33,000 the continued product of the area of the piston in inches, the pressure in pounds weight per square inch, the length of the stroke in feet and the number of strokes per minute. Thus, by the horse-power of an engine we merely mean the numerical rate at which it can do work, expressed in terms of the above conventional unit, and this number obviously coincides with the number of horses to which the engine is equivalent as regards work in the same time. Owing to friction the available horse-power is less than the actual horse-power got by this rule.

HORSFORD, EBEN NORTON, born in Livingston county, N. Y., July 27, 1818; studied engineering and was engaged on the geological survey of the State of New York. In 1840 he was appointed professor of mathematics in the female academy at Albany, where he remained for four years. He afterward studied in Germany, under Liebig, and on his return to the United States in 1847, was

elected Rumford professor of science at Harvard. After sixteen years' service there he resigned to engage in chemical experiments. He is an A. M. of Harvard and M. D. of Castleton, Vt., and has written extensively on scientific subjects.

HORSLEY, JOHN CALLCOTT, R. A., son of the late William Horsley, the well-known musician, was born in London, January 29, 1817. His first exhibited picture, painted while he was a youth—*Rent Day at Haddon Hall in the Sixteenth Century*—was spoken of in high terms by Wilkie. *The Chess Players*, *The Rival Musicians*, *Waiting for an Answer*, were first seen in the British Institution, and he exhibited, for the first time at the Academy, the *Pride of the Village* (in the Vernon Gallery). This was followed by *The Contrast: Youth and Age*, in 1840; *Leaving the Ball*, another *Contrast*—gay pleasure-seekers on the one hand, the homeless outcast on the other; and *The Pedlar*, both in 1841; *Winning Gloves*, in 1842; and *The Father's Grave* in 1843. In the latter year Mr. Horsley's cartoon of *St. Augustine Preaching* gained, at Westminster Hall, one of the three prizes in the second rank. He was among the six painters commissioned to execute frescoes for the palace at Westminster. That of 1845, for *Religion*, was approved, and the subject executed at large in the House of Lords. In 1847 his colossal oil painting, *Henry V., believing the King dead, assumes the Crown*, secured a premium. In 1882 Mr. Horsley was elected treasurer of the Royal Academy. He has been very active in bringing together the magnificent collections of "Old Masters" displayed every winter since 1870 at Burlington House.

HORSE-RADISH TREE, the *Moringa Pterygo-sperma*, a tree common in India and Arabia, and cultivated in various other tropical countries. The fruit is eaten as a vegetable or pickled, and its seeds are important as furnishing the commercial oil of ben. The fresh root has an odor and taste resembling that of the horse-radish.

HORSE-SHOEING. **FARRIER**, A horse used for drawing burdens heavier than his own weight upon hard roads or for fast riding, requires to be shod from time to time. If left unshod his hoofs break and wear away more rapidly than they are renewed by the addition of horny material from within, and become tender and sore. This is avoided by properly paring the hoofs and nailing on iron plates, or iron bands, called *horseshoes*.

The hoof of the horse consists of three portions, which are so closely united as to seem but one. These are the wall or crust, the sole, and the frog.

The wall is all that part of the hoof that is visible below the hair when the foot is placed upon the ground. It is in the form of a cylinder cut across obliquely at the top. It is deepest in front, from three to four inches, and grows gradually less in depth toward its posterior aspect. This wall is in front about half an inch in thickness, becoming thinner on the back side as it extends around the foot. It has an edge bearing upon the ground of about half an inch around the outside of the bottom of the foot. Upon the inner side of the foot the wall is thinner than upon the outside.

The illustration will show the relative parts: Ground surface of hoof, *a*, toe; *a* 1, inner toe; *a* 2, outer toe; *b* 1, inner quarter; *b* 2, outer quarter; *c* 1, inner heel; *c* 2, outer heel; *d*, *d*, *d*, sole; *e*, *e*, wall of the hoof; *f*, *f*, the bars; *g*, *g*, the commissures; *h*, *h*, *h*, the frog; *h*, part under the navicular joint; *k*, boundary of the cleft; *i*, *i*, the bulbs of the heels. The wall is divided into toe, quarters, heels and bars.

The toe constitutes about two thirds of the wall, and is sometimes subdivided into toe, inner toe and outer toe. It is the deepest and thickest part of the wall, and stands at an angle of about forty-five degrees. When the angle of inclination is much greater than this the feet are designated as flat and weak. Flat and weak feet usually obtain in large and heavy animals, and it has been thought that as the foot is flattened the anterior wall will be drawn down by the weight, at length becoming fixed.

The quarters are the portions on each side, midway between the toe and the heels, and are designated as the inside and outside quarters. The fibers composing them run obliquely upward and backward, parallel to those of the toe. The quarters slope downward and backward, and become thinner as they approach the heels.

The heels are the two protuberant portions of the wall by which it is terminated posteriorly. The wall here is shortest and thinnest, the fibers being only about an inch in length, and not exceeding the fourth of an inch in thickness. While, in its natural state, there is some degree of elasticity in the entire wall, there is much more in the portion that covers the heels.

The bars are reflections of the wall in toward the center of the foot, on its ground surface. They gradually approach each other, and come together a little in front of the center of the foot. In the natural, healthy foot, that has never been shod, the bars appear as sharpened prominences, like braces, between the center of the foot and the heels. They are well adapted to keep the heel open, and prevent contraction of the hoof. In the unshod foot, the bars have a bearing upon the ground second only to that of the edge of the wall.

The sole fills the space between the wall and the bars. It is in the form of an irregular arched plate, the concavity being toward the ground. It is firmly attached by its outer convex edge, to the inner border of the wall, while its inner straight edges are attached to the bars. Throughout its whole extent the bars intervene between the sole and the frog. The center of the sole is the thinnest portion of it, and it also constitutes the summit of the arch. The lower circumference of the arch, which is also the thickest and strongest, everywhere abuts against the sides of the wall.

The frog is a wedge-like mass filling the angular space between the bars, and consists not of solid horn, as might at first seem, but of a series of elastic arches. It has been not inaptly compared to an elastic keystone received into an elastic arch, communicating in some cases, and admitting in all, the springing movements of which such an arch is capable. The base of the frog lies between and connects the posterior curved portions of the hoof, limiting to some extent their action. The sides are connected with the bars by their upper edges, leaving upon the ground surface two deep channels between the lower border of the bars and frog, which have been termed the commissures of the frog. The horny material arching over these channels is called the arch of the commissures. In the center of the frog as we look upon its ground surface, is a deep, narrow depression, the cleft of the frog, which extends further into the soft tissues of the foot than the commissures. This cleft is arched over in a similar manner, and the cone-like mass, as viewed on its inner upper surface, has received the name of frog-stay or bolt. Looking upon both the exterior and interior surface of the frog, we see that with the bars it forms three elastic foldings, which act as springs to keep the heels apart and the foot well spread. In the natural, unshod foot, the frog though protected to some degree by the inner border of the wall and by the sharp prominences of the bars, must still receive pressure at each step.

The first question in scientific horse-shoeing, "How must the hoof be dressed in order to bring those parts of its inferior surface upon the shoe, which are by nature intended to be the principal weight-bearers?" and the next question is, "How must the shoe be fashioned and applied to the sole?"

A leading French farrier, La Fosse, maintained that the frog, or central prominence of the hoof, is the main weight-bearer, in connection with the wall, and should therefore be placed squarely and firmly upon the ground, but the foremost Italian farrier, Fiaschi, says the frog must not be placed upon the ground on a level with the lower surface of the shoe at the heels, because it is not the primary weight-bearer.

In the feet of colts running freely over upland pastures, the hoofs are marked with quite a downward growth at the heels, a less active growth at the quarters, and a much more rapid downward growth at the toes. The upturned hoofs show plainly that the walls at the heels bend in and land bears the weight at every step. The quarters are elevated, as the hollow of the human foot is arched above the ground. That the entire weight of the horse rests upon the toe-end of the hoof was demonstrated by Dr. Coleman, professor of the Royal Veterinary College, of London, as early as 1799. He removed the bottoms of a horse's front feet-soles, bars, and frogs

—and then walked and trotted him, and even caused him to kick with both hind feet in the air, so that the entire weight of his body was violently concentrated upon the bare front feet, yet the internal structure did not descend to the least perceptible degree.

Subsequent examination of the feet of colts showed also, that their frogs are more spongy and elastic than the front and side walls. And it was also noticed that there is a natural expansion of the hoofs at the heels when the feet press upon the ground, and that a contraction to the normal dimensions follows when the hoof is lifted and freed from pressure. This lateral expansion of the hoofs at the heels every time when a horse's foot is coming down upon the ground breaks the forces of the great concussion produced by a run or gallop of the animal. While the hoofs expand the slightly elevated frogs and soles descend far enough to come in contact with the ground, but with a gentle pressure only.

Previous to these observations the walls of horses' hoofs were often softened with lotions, poultices, or wet swabs. A leather, rubber, felt sponge, or other cushion was sometimes placed between the shoe and the bottom of the foot. This is all wrong except in the case of bruised soles. As the wall in front and at the heels carries the entire weight of the animal it must afford a firm, unyielding support for this weight; whereas the frog is yielding by virtue of its spongy texture, and thus neutralizes the last vestige of concussion produced by a run or gallop. Modern farriers are guided by these observations and considerations. They furnish the only correct data for paring and shoeing both the normal and abnormal hoof.

1. The wall should be perfectly level; that is, both heels must measure the same distance from the ground surface to the coronet, where the hair and hoof unite. Then, at equidistant points, the quarters, the ground surface of the wall, from the heels, the quarters must measure the same height from the ground to the coronet. Then the wall, around the forward arches of the toe, must measure, at corresponding points, the same from the ground surface to the coronet. Then, and only then, will the foot wall be perfectly level, and the action of the foot will be comfortable and correct. For the wall of the hoof land squarely upon even heels, revolve evenly over equal quarters, and spring straight and true from the toes.

2. The hoof must be balanced, that is, the hoof and quarters must be equidistant at corresponding points of the frog. This balancing prevents undue weight on either side, and therefore enables the tendons to carry the hoof straight both in elevating it from the ground and carrying it out straight and true without any interference with the other foot and limb. Moreover, it equally distributes the pressure by equalizing the sections of the foot on either side of the frog.

3. It was found that most foot maladies resulting from horse-shoeing are due to an uneven and unbalanced wall in connection with an undue height of the heels. If the heels are allowed to grow too high, the greater part of the weight is thrown forward upon the bone structure of the limb, and the bones of the foot are forced forward against the wall in front. Inflammation of the feet and soreness in the joints and bones soon ensue. If the heels are allowed to grow such a contrary result. If the heels are allowed to grow too long, then the preponderance of weight is thrown upon the flexor tendons, which are on the back side of the foot, and these tendons become inflamed. The hoofs must therefore be pared in such a way that the weight of the animal is equally distributed between the bones and flexor tendons. If one heel is permitted to grow higher than the other, bruises on the high heel, called corns, with result.

4. Formerly farriers erroneously maintained that the sole should be pared till it yields to the pressure of the thumb. The sole is naturally only from $\frac{1}{4}$ to $\frac{3}{8}$ of an inch thick. It must in all cases, when in a natural condition, be so pared as to approximate the concavity of the hoof, and so that the hoof in its stance should it press upon the shoe, except where the wall is so thin and weak as not to be able to bear the weight of the horse without pain. The frog must only be pared to remove the ragged edges. Some prominent farriers even maintain that the frog should never be touched, alleging that nature sheds the surplusage of horny material at the four seasons.

Horses with weak, tender, or bruised soles may for a time require leather or waterproof pads, but as the sole grows these should be discontinued; they are never required in healthy feet where the sole, which is the best and most natural protection, is allowed to grow up to the coronet with a knife. Horses with corns should have their shoes made with a wide inside web, which rests upon the bars, or have for a time a bar shoe. The last nail on the inside should also be dispensed with, and the seat of the corn or bruise carefully pared out, but without injuring either the frog or bars. If, from constant cutting, the bars are unfit to aid in the crust in carrying the shoe, it will be better to turn the shoe off as possible on soft ground, and waiting the healthy growth of the foot. In troublesome cases of thrush such tips are also most serviceable, allowing the frog the natural healthy pressure for which it is intended, and with astringents and cleanliness greatly expediting a cure. Greasy horses should have the toe shortened, and the frog turned up, and the shoes made light and nicely fitted. Overreach, or cutting of the heel of the forefoot with the shoe of the hind, is

remedied by filing round the posterior edge of the offending toe, and keeping that shoe as far back as possible on the foot.

Of the many recent patterns of horseshoes we mention the following: The *Pert-planter* of Charlier is a narrow rim of iron forged just as wide as the wall. The wall is cut away at its lower margin to the depth equal to the thickness of this iron rim, which is neatly inserted in the groove thus made. Its design is to prevent the wear of the wall by the contact with hard roads. It is based upon the theory that the entire base of the hoof-walls, bars, frog, and sole should come upon the ground at the same time.

The four-calkin shoe, invented by Robert Bonner, is one of the greatest improvements of modern farriery. Two of the calkins, made oblong, are welded onto the web of the heels of a plain shoe, while the other two are placed at the inner edges of the forward arches of the quarters. It increases the articulation of the foot, prevents the danger of slipping, and protects the flexor tendons.

The rolling-ball shoe of Dr. David Roberge is another valuable hospital shoe. It is solid at the bottom, being round or convex in shape at the base. If there is any soreness in the joints, muscles or tendons, the rolling-ball shoe will enable the horse to revolve and ease the foot in such a position as will relieve the strain upon the injured part.

A SOUND FORE-FOOT PREPARED FOR THE SHOE.

Copied from Stonehenge's *Horse in the Stable and the Field*.

A, A, the heels of the crust; B, the toe cut out to receive the clip; C, C, the quarters of the crust; D, D, the bars as they should be left, with the full frog between them; E, E, the angles between the heels and bars, where corns appear; F, F, the concave surface of the toe; G, G, the bulbous heels; H, the cleft.

The wing-heeled centennial shoe follows the wall to the heels, and then turns with the inflexion of the wall and covers the bars. It has been found to relieve horses with weak heels or quarter-cracks and to be valuable for saddle-horses that have to bear forehanded, the extra weight of the rider.

There are many other patterns, especially of rimmed shoes, some plain like the English black, and some corrugated like the American form of Mr. Goodenough. But they present nothing novel either in theory or design.

The hoof-expander of F. P. Roberge, veterinary surgeon in New York, consists of a peculiarly formed spring contrivance which is introduced into the under portion of the hoof, and exerts a constant gentle pressure against the outer walls of the hoof, thereby preventing contraction in form where there is a tendency in that direction. From contraction, or wiring-in of the quarters, result shortness of gait, soreness, corns, and frequently quarter-cracks. The hoof, or horny box is apparently the same to the horse as a shoe is to man. When the horn of the sidewalls presses against the sensitive parts within the hoof, corns are produced in the same way as when we wear tight shoes. Roberge's hoof-expander is intended to prevent this.

One of the main requisites in horse-shoeing is the greatest possible lightness of the shoes, consistent with the use of the horse, their smallest size, and the least possible number of nails consistent with their secure fastening to the wall of the hoof. It was shown by a French hippopathologist, Bouley, that an ounce of artificial weight at the foot is equal to a pound at the shoulder. Besides, it has been found that light shoes not only wear as long as heavy ones, but that they are much less apt to fall off the feet. The nails should also be light and smooth, and must be driven so as to have a short, thick, transverse hold, rather than extending high up, which splits the wall.

The cruel practice of overheating the shoes and burning the hoofs for a close fit, has been mostly discarded as an injury to the texture of the horn. The shoes are now only slightly heated, and in many cases, where they are carefully made, they are fitted entirely cold.

Horseshoes made of rawhide, pressed into the proper shape and dried, have been recommended. Although they are hard enough to be serviceable and lasting they have never come into extensive use.

HORVÁTH, MICHAEL, Hungarian historian, born at Szentes, in the county of Csongrad, Oct. 20, 1809, died at Carlsbad, Aug. 19, 1878. He studied theology at the seminary of Waitzen, took orders in 1830, in 1844 became professor of the Hungarian language and literature in Vienna, and four years later bishop of Csanad. During the revolution of 1848 he held the appointment of minister of public instruction and worship, and the defeat of the Hungarians drove him into exile. Under the amnesty of 1867 he was permitted to return. Of several historical works which he wrote, three deserve special mention.

HOSMER, HARRIET G., born at Watertown, Mass., October 9, 1830; was educated at Lenox, Mass., and early displayed a taste for art. She received a few lessons in modeling in Boston, and then entered a medical college in St. Louis to study anatomy and dissection. Her first work in marble was a reduced copy of Canova's bust of Napoleon, which was soon followed by an ideal work, *Hesper*, or *The Evening Star*. In 1852 she went to Rome and became a pupil of Gibson. After two years of study and modeling from the antique, she produced the busts of *Daphne* and *Medusa*. Her first full-length figure in marble was *Enone*, completed in 1855, and this was followed, two years later, by *Beatrice Cenci Sleeping in Her Cell*. In the summer of 1865 she modeled *Puck*, of which many copies have been made. This was followed by *Will-o'-the-Wisp*. A colossal statue of *Zenobia, Queen of Palmyra, in Chains*, was her next important work, followed by a statue of *Thomas H. Benton*, the *Sleeping* and the *Waking Faun*, and a design of a memorial monument to Abraham Lincoln. In 1893 she completed her statue of *Queen Isabella of Spain*, ordered for the Columbian Exposition. Besides her skill in sculpture, Miss Hosmer has exhibited talents for designing and constructing machinery and devising new processes, especially in connection with her own art, such as a method of converting ordinary Italian limestone into marble. She has resided for many years in Rome, making occasional visits to the United States.

HOSPITALS, IN THE UNITED STATES. See *Britannica*, Vol. XII, pp. 301-307; *DISPENSARY*, in these Revisions and Additions.

HOST (Lat. *hostia*, "a victim"), the name given in the Roman Catholic church to the consecrated bread of the eucharist, so called in conformity with the doctrine of that church that the eucharist is a "sacrifice," in the strict sense of the word, though, in the common language of Roman Catholics, "host" is used for the unconsecrated altar-bread, and even so occurs in the offertory of the Roman missal. The host in the Latin church is a thin wafer of unleavened bread, made of the finest flour,

and bearing upon it the figure of the Crucifixion or some other emblematic device. In all ancient liturgical rites the consecrated host was broken before being consumed by the priest. In the Roman church the celebrant first breaks it in two, and then from one half detaches a fragment which he drops into the chalice. In the Greek and other Oriental churches, as well as in various Protestant communities, the eucharist is celebrated in leavened bread. The use of unleavened bread is founded on the belief that Christ could only have used such bread when instituting the eucharist at the Paschal feast. Luther followed the Roman church on this point, but did not break the host.

HOSTAGE, a person given to an enemy as a pledge for the proper fulfillment of a treaty condition. Formerly the evasion of the terms of the treaty by one of the contracting parties was regarded as entitling the enemy to put to death the hostages that had been given up to them.

HOTBED, a bed of fermenting vegetable matter, usually surmounted by a glazed frame, employed in gardening for cultivating melons and cucumbers, and tender annuals, propagating greenhouse plants by cuttings, seeds, or grafting, etc. It is inexpensive and formerly it was an indispensable adjunct to the garden, but the almost universal employment of hot water as a heating agent for horticultural purposes has latterly greatly circumscribed its use. The size of the bed is regulated by the degree of heat required for the purpose in view. A bed of stable-dung with or without leaves intermixed, four feet thick, will for sometime after it is built maintain a temperature of from 75° to 90°, which is sufficient for most purposes. As the fermentation declines the bed cools down, but heat is readily increased by adding fresh material to the sides of it. The bed should be made a few inches wider and longer than its frame, and from six to nine inches higher at the back than the front, to secure a better angle for light. The farmer's hotbed is made, in its simplest and cheapest form, as follows: In northern climates choose early in the year a dry place exposed to the south and protected from the north. Dig out a trench 18 inches deep and five feet wide. Set stakes around it, and nail boards for the frames as long as may be needed—nine or 12 feet perhaps, and cover with a fitting sash. Then fill the pit with coarse horse manure; bank the earth up against the frame and leave it until about March, when it will be time to finish it. The end of the frame should be of this shape, sloping to the south:

HOTCHKISS, BENJAMIN BERKELEY, born in Watertown, Conn., October 1, 1826, became a machinist, and in 1856 designed a field-gun on a new pattern. In 1860 he submitted to the United States Government an improved system of rifled projectiles, which was largely used during the civil war. In 1867 he introduced his revolving cannon to the European governments, and since then devised a magazine-rifle and a quick-firing gun. He died February 14, 1885.

HOTEL (Fr. *hôtel*; Lat., *hospitale*), a superior kind of inn. One point of difference between the European and the American system is that under the former, except in the case of a *table d'hôte*, the charge is for each dish ordered, while under the

American plan a fixed price is charged for the whole meal.

In their structure, interior economy, management and public uses, the hotels of this country differ materially from those of Great Britain and the continent of Europe. Much thought and labor has been expended upon the "art of hotel keeping" which has attained a great degree of perfection in the larger cities of the United States and has led to the adoption of what is now known as the American system in many of the capitals and more populous cities of Europe. This gradual change in the hotel system of Europe, and the elevation of its ancient hostleries to the higher class of building now generally devoted to the accommodation of the public, is due in great measure to the demands of Americans traveling abroad. The result is seen in the erection of such hotels as the *Grand* in Paris, the *Metropole* and the *Victoria* in London and the *Midland Hotel* in Glasgow. In America, the hotel is not only a home for transient guests, but whole families frequently take up therein a permanent residence, thus avoiding all the cares of housekeeping. The hotel itself is not infrequently upon a scale of such magnificence as would entitle it to the designation of "palace" in Europe. It is sumptuously furnished and decorated. Its chambers are counted by the hundreds, its rotunda is thronged day and night by a motley crowd not necessarily contributing one penny to the exchequer, but whom custom has licensed to enjoy certain privileges. Its parlors in time of political excitement are thronged with the adherents of one or other of the candidates, the object of the American landlord being to attract as large a crowd as possible and make his house popular. This feature of the American hotel is invariably a source of astonishment to the visiting European whose ideas of an "inn" are connected rather with snugness and quiet comfort than magnificence and ostentation. At all the summer resorts of this country are usually to be found one or more gigantic caravansaries, capable, like their city counterparts, of housing innumerable guests and forming of themselves entire communities. A notable instance was the hotel at Rockaway, L. I., which was of such an enormous length that to a person looking along its ridgepole, the curvature of the earth was distinctly apparent. This huge building was, however, totally destroyed by fire. At Brighton Beach, a popular resort of New Yorkers during the heated term, one of these monster hotels was saved from the sea, which for some seasons had been encroaching upon its foundations and threatened to engulf it, by an engineering feat which is perhaps without a parallel. The immense building was raised from its foundations by jackscrews and placed upon strong carriages built for the purpose, the wheels of the carriages resting in their turn upon a dozen or more lines of railway. Immense cables were then attached to the building and by the united power of eight locomotives the hotel was moved bodily beyond the reach of the waves. This feat was accomplished without disturbing the usual routine of the hotel, the building sustaining no serious injury while in transit.

The luxury and completeness of the American hotel system have their counterparts at sea in the magnificently equipped vessels of the transatlantic and transpacific services, which in obedience to the demands of the traveling public have become gradually transformed into great floating hotels. These splendid vessels are now replete with every comfort. They place at the disposal of their patrons handsome saloons, music and smoking rooms, and a well stocked library. Barber shops and bath rooms contribute at sea, as on shore, to the comfort of the

passengers, and not infrequently a newspaper is issued every morning giving the latest news which can be gathered aboard ship. In railroad travel, in the United States, the influence of the American hotel system is felt in the luxurious equipment of the cars as compared with those in use on European railroads under the old system.

With the invention of the elevator, which transports passengers quickly to the highest stories, the hotel has evinced of late years a tendency skyward. Structures of this character are not infrequently found, in the more populous cities, of 12 and 14 stories in height. Where care has not been taken, disastrous conflagrations have in the past sometimes followed this reckless piling up of inflammable material, and the awful holocausts at St. Louis and Milwaukee, when the Southern Hotel and the Lindell House were transformed in a few minutes to huge funeral pyres for their guests, constituted lessons which could not be easily forgotten. The utmost care is now taken to make these huge structures fire-proof, and to provide them with the most complete equipment for extinguishing any outbreak of the much dreaded element. The general adoption throughout the country of what is technically termed "the Chicago fireproof construction" has tended to greatly lessen the danger from fire in edifices of this character. Some enormous hotels, of a temporary character, were erected close to Jackson Park in Chicago upon the American plan during the holding of the World's Columbian Exposition in the summer of 1893.

HOT SPRINGS, a city and county-seat of Garland county, Ark., 55 miles southwest of Little Rock. A United States Army and Navy general hospital and a Roman Catholic school and convent are located here. In the vicinity valuable mines of gold, silver, and lead are worked. The city contains 72 thermal springs, and these are visited by large numbers of health-seekers. Pop. (1890), 8,086.

HOTTENTOT'S BREAD, a kind of yam, *Tesudinaria elephantipes*, native of South Africa.

HOT WALLS, or **FLUED WALLS**: in gardening, walls furnished with furnaces and flues, in order to produce finer kinds of fruit than could otherwise be expected in the climate. The flues are led as obliquely and make as many turns from right to left as is consistent with their drawing well, so that as little heat as possible may escape from the chimney, and as much as possible may be expended on the wall. The heat is applied chiefly during spring.

HOUDIN, **ROBERT**, French conjurer, born at Blois in 1805, died there in 1871. He studied mechanics, and, after winning a medal for his toys and automata at the Paris exhibition of 1844, opened a series of exhibitions, which he continued for ten years, retiring in 1855 with a large fortune. In 1856, at the invitation of the French government, he went to Algeria and entered into competition with the miracle-working priests. He was completely successful, and did much toward destroying their influence.

HOUGH, **FRANKLIN BENJAMIN** (1822-1885), an American author. From 1848 to 1860 he practiced medicine in Somerville, and in Albany, N. Y. At the beginning of the civil war he entered the U. S. volunteer service as a surgeon and served nine months. He then settled in Lowville, N. Y., and devoted the remainder of his life to literature.

HOUGH, **GEORGE WASHINGTON**, born in Montgomery county, N. Y., Oct. 24, 1836; graduated at Union College, 1856, and turned his attention to astronomy. In 1860 he became astronomer at Albany, N. Y., and in 1879 was made director of Dearborn Observatory, Chicago. His principal scientific work was the cataloguing of double stars,

more than 300 different stars having been discovered by him and catalogued. He was a member of several scientific societies and has published annual reports of observations taken at Dearborn Observatory.

HOUGHTON, the county-seat of Houghton county, Mich., on Lake Portage. It is a copper mining center. Pop. (1890), 2,062.

HOUGHTON, **RICHARD MONCTON MILNES**, LORD, an English author, born at Pontefract, June 19, 1809, died at Vichy, Aug. 11, 1885. He was educated at Cambridge, graduating in 1831. From 1837 to 1863 he represented Pontefract, first as a Conservative, but latterly as an Independent Liberal. In 1863 he was raised to the peerage. He championed oppressed nationalities, liberty of conscience and the rights of women; and secured the passage of a bill for the establishment of reformatories.

HOUGHTON-LE-SPRING, a town of England, in the county, and six and a half miles northeast of the city of Durham. Its growth is mainly due to the neighboring collieries. The parish church contains the altar tomb of Bernard Gilpin, who founded a grammar school here. Population, 6,041.

HOUK, **LEONIDAS CAMPBELL**, a United States Congressman, born in 1836. In 1859 he was admitted to the Tennessee bar and practiced until the beginning of the war, when he entered the Union army. He served till April, 1863, when he resigned on account of ill health. From 1866 to 1870 he was judge of the 17th judicial circuit of Tennessee, and in 1872 became a member of the legislature. He was elected as a Republican to the 47th, 48th, 49th, 50th, 51st, 52d and 53d Congresses.

HOULTON, the county-seat of Aroostook county, in the eastern part of Maine. The chief productions of the vicinity are potatoes, hay, starch, cedar shingles, and hemlock bark. Pop. (1890), 4,015.

HOUMA, a post-village, capital of Terre Bonne parish, La., on a branch of the Texas and Louisiana Railroad, 70 miles from New Orleans. It has a convent and an academy. Pop. (1890), 1,280.

HOURL, among the Mohammedans, a nymph of Paradise, whose companionship is to be one of the great felicities of the true believers.

HOURES, **THE**: in Greek mythology, the goddesses of nature and the seasons of the year. They were believed to especially personify the pleasing characteristics of the seasons. In art and poetry they were represented as blooming nymphs, decked with flowers and jewels.

HOUSATONIC RIVER, **THE**, rises in Berkshire county, Mass., follows a southerly course through Connecticut amid beautiful, wild scenery, and enters Long Island Sound after a course of 150 miles. Tide-water ascends the river for 14 miles.

HOUSE, **EDWARD HOWARD**, born in Boston, Mass., in 1836; was for many years connected with the press of that city and of New York, and also acted as foreign correspondent in Japan for the New York "Herald."

HOUSEMAID'S KNEE, the term commonly applied to an acute or chronic inflammation of the bursa, or sac between the knee-pan and the skin. Housemaids were considered especially liable to it from their kneeling to scrub on hard floors. In its acute form it causes considerable pain, swelling and febrile disturbance, the swelling being very superficial and in front of the patella. The treatment in the acute form consists essentially in rest, and the use of leeches, fomentations and purgatives; if suppuration take place the sac must be freely opened and the pus evacuated. The chronic form may subside under rest, blisters, etc., or it may require incision or excision for its cure.

HOURI, among the Mohammedans, a nymph of Paradise, whose companionship is to be one of the great felicities of the true believers.

HOURS, **THE**: in Greek mythology, the goddesses of nature and the seasons of the year. They were believed to especially personify the pleasing characteristics of the seasons. In art and poetry they were represented as blooming nymphs, decked with flowers and jewels.

HOUSATONIC RIVER, **THE**, rises in Berkshire county, Mass., follows a southerly course through Connecticut amid beautiful, wild scenery, and enters Long Island Sound after a course of 150 miles. Tide-water ascends the river for 14 miles.

HOUSE DOVES, in the laws of England and America, are protected like domestic animals.

HOUSEHOLD TROOPS: in Great Britain, troops whose special duty it is to attend the sovereign and to guard the metropolis. They comprise three regiments of cavalry: the First and Second Life Guards and the Royal Horse Guards; and three regiments of foot: the Grenadier Guards, of three battalions, and the Coldstream and Scots Guards, of two battalions each. See **ARMY**, in *Britannica*, Vol. II, pp. 578, 580.

HOUSE OF CORRECTION, a jail not under the ordinary charge of the sheriff, but governed by a keeper. The houses were originally intended for the detention of vagrants and convicted persons, compelling them to work. The persons who may be committed to them are prisoners convicted of felony or misdemeanor; persons committed on charge or suspicion of felony, or of misdemeanor, and vagrants. Any justice may commit to the house of correction persons awaiting trial and persons convicted of small offenses.

HOUSTON, **DAVID CRAWFORD**, was born in New York city December 5, 1835, and graduated at West Point in 1856. He served in Oregon until the Civil war began, and was brevetted colonel in 1865 for gallant conduct during the rebellion. He became connected with the construction of river and harbor improvements on the Atlantic coast and the upper lakes, and is a member of the board of engineers for fortifications.

HOUSTON, a city and the county-seat of Harris county, Texas, on Buffalo Bayou, 49 miles northwest of Galveston, 164 miles east-southeast of Austin, and 152 miles south of Palestine. It contains many religious and educational institutions, and manufactories of engines, machinery, carriages, etc., besides cotton factories, machine shops, and planing mills. Large quantities of cotton, maize and other products are shipped here. Population, 1880, 16,513; 1890, 27,411.

HOUTZDALE, a post-village of Clearfield county, Pa., situated on a branch of the Tyrone & Clearfield Railroad. It has a lumber mill, and much coal is mined in the vicinity. Pop. (1890), 2,231.

HOVEY, **ALVAH**, an American clergyman, born in 1820. In 1848-49 he was pastor of the Baptist church in New Gloucester, Me., and from 1849 to 1868 held a professorship in Newton Theological Institution. Since 1868 he has been president. He has written several theological works.

HOWARD, **BRONSON**, a well known American dramatist, was born in Detroit, Michigan, in 1842. After acquiring a sound education he gravitated into journalism, but in 1870 the success of his first play, *Saratoga*, determined his career. He produced in rapid succession, *Diamonds*, *Hurricanes*, *The Banker's Daughter*, his best known play; *Wives*; *Young Mrs. Winthrop*; *One of Our Girls*; *Met by Chance*; *The Henrietta* and *Shenandoah*, all of which have been received with favor and some of which

have been reproduced in England. Since 1875, Mr. Howard has resided in New York and London.

HOWARD CITY, a post-village and railroad junction of Montcalm county, Mich., 33 miles north of Grand Rapids, where lumber and shingles are manufactured.

HOWARD UNIVERSITY. See **COLLEGES**, in these Revisions and Additions.

HOWARD, **JOHN EAGER**, an American soldier and statesman, born in Baltimore county, Md., in 1752, died at Baltimore, Oct. 12, 1827. He fought in the battle of White Plains, N. Y., in 1776 as captain in a Maryland regiment, and in 1777 he distinguished himself at Germantown, where he commanded a regiment. At the battle of Cowpens, Jan. 17, 1781, Col. Howard commanded the Continentals, and led them in a bayonet charge which decided the fortunes of the day. At Entaw Springs he was severely wounded. After the war he was in Congress 1787-88, and governor of Maryland from 1789 to 1792. From 1795 to 1803 he was United States Senator from Maryland.

HOWARD, **OLIVER OTIS**, an American general, born at Leeds, Me., in 1830. After graduating at West Point in 1854 he was made instructor in mathematics there. In 1861 he became colonel of a regiment of Maine volunteers; and at the battle of Bull Run, July 21, of the same year, he commanded a brigade, and was soon after made brigadier-general. At the battle of Fair Oaks, June 1, 1862, he lost his right arm. Gen. Howard took part in the battles of Antietam, Chancellorsville, Gettysburg, Lookout Valley, Missionary Ridge, Chattanooga; commanded the right wing of Sherman's army during its march to the sea and through the Carolinas; was made commissioner of the Freedmen's Bureau, May 12, 1865, and held that office until June 30, 1872, when it was closed. In 1869 he was made president of Howard University, which had been established in Washington for the higher education of the colored people, but resigned in 1873. In 1877 he conducted a campaign against the Nez Percés Indians, and pursued them for 1,300 miles, as related in his book, *Chief Joseph*. He also defeated the Bannacks and Piutes in 1878. In March, 1886, he was promoted to be major-general, U. S. A., and succeeded Gen. Hancock in command of the Division of the Atlantic.

HOWE, **ELIAS**, an American inventor, born at Spencer, Mass., in 1819, died at Brooklyn, N. Y., Oct. 3, 1867. While working in a machine-shop at Lowell, Mass., and afterwards in one at Boston, he developed his invention of the sewing machine, and, having constructed the first machine in May, 1845, obtained a United States patent Sept. 10, 1846. He tried in vain to introduce his invention in England. On his return to Boston in 1847 he found that his patent had been infringed. For seven years he had to litigate to protect his patent rights, until, in 1854, the principal manufacturers, after being defeated in the courts, agreed to pay him royalties on the sewing machines made by them. His yearly income from this source increased to \$200,000, and the total fortune derived from his invention amounted to two millions of dollars. He received many marks of distinction for the invention.

HOWE, **JOSEPH**, governor of Nova Scotia, born at Halifax in 1804, died there June 1, 1873. He was originally a printer. In 1828 he became editor and proprietor of the "Nova-Scotian." In 1840 he was a member of the provincial cabinet, but resigned the secretaryship in 1854 to superintend the construction of the first railroad in Nova Scotia. After 1872 he became lieutenant-governor of Nova Scotia. His *Speeches* and *Public Letters* appeared in two volumes in 1858.

HOWE, JULIA WARD, an American poetess, wife of Dr. S. G. Howe, born at New York in 1819. She took a deep interest in her husband's philanthropic labors, and was a warm friend of the anti-slavery cause. During the civil war she worked zealously with the United States sanitary commission. By voice and pen she contributed to many social reforms. At the New Orleans World's Fair in 1885 Mrs. Howe was the chief of the women's department. Her poetic spirit found expression in *Passion Flowers* (1854); *Words for the Hour* (1856); *The World's Own*, and *Hippolytus*, two tragedies; *Liter Lyrics* (1866), which comprised "Poems of the War, Lyrics of the Street, Parables and Poems of Study." The most memorable of her poems is the "Battle Hymn of the Republic," which gave expression to the deep moral purpose of the war. Mrs. Howe was also a zealous worker in the cause of woman suffrage.

HOWE, SAMUEL GRIDLEY, an American philanthropist, born at Boston in 1801, died there in 1876. After studying medicine he went to Greece in 1824, where he served as surgeon in the war for independence, and was placed at the head of the surgical service. In 1831 he assisted in establishing an asylum for the blind in Boston; was appointed superintendent of the institution, and went afterwards to Europe to examine the schools for the blind. He also assisted in founding a school for training idiots, which was organized as the Massachusetts School for Idiots. In 1871 he was sent by President Grant as a member of the commission to visit San Domingo and report upon the advisability of its annexation to the United States. Howe published a *Historical Sketch of the Greek Revolution* and a *Reader for the Blind*.

HOWELLS, WILLIAM DEAN, an American author, was born at Martinsville, Ohio, in 1837. He learned the printer's trade, but he soon began to write for the papers, both prose and verse, and in 1858 he was editor of the "Ohio State Journal." In 1860 he was appointed United States Consul at Venice, and there he remained until 1865. His Italian experiences are expressed in his *Venetian Life and Italian Journeys*. After his return to the United States Mr. Howells became editor-in-chief of the "Atlantic Monthly" (1871), and is noted for the faithful portrayal of American character of the present day. A collection of his poems was published in 1873. In 1885 he removed to New York City to take charge of an editorial department in "Harper's Magazine." In 1892 he was called to the chief editorship of the "Cosmopolitan Magazine;" but shortly resigned in order to pursue more strictly literary vocations. As a writer Mr. Howells reveals himself to us as an exceedingly industrious and painstaking artist, but his work is sadly marred by over elaboration and it is absolutely devoid of any of those human touches which characterize the works of really great writers. He has succeeded in gathering around him a so-called school of modern realists, but only one or two of these have achieved anything like literary reputation, and that promises to be but of short duration. He must be credited, however, with sincere intentions.

HOY, a small coasting vessel, differing little from the sloop or smack, and often used for conveying goods from a large vessel to the shore.

HOYA, a genus of tropical plants of the order *Asclepiadaceæ*, having a five-cleft wheel-shaped corolla, and a five-leaved spreading fleshy corona. Some of the species are common in hot-houses, and from the appearance of their flowers they are called *wax-plants*.

HUANO DYING PLACE, a name given to certain "spots" at the southern extremity of Patago-

nia, to which the inhabitants of the surrounding plains repair on the approach of death to deposit their bones. Darwin and Fitzroy first recorded this strange instinct of the people. The best known of these dying places are on the banks of the Santa Cruz and Galleos rivers, where the river valleys are covered with dense thickets of bushes and trees of stunted growths.

HUBERTSBURG, a village and castle, formerly a royal hunting-seat of Saxony, 25 miles from Leipzig, built in 1721 by Prince Frederick Augustus, afterward King Augustus III., of Poland. It was much injured during the Seven Years' War; and there Feb. 15, 1763, was signed the treaty by which that war was ended. Since 1840 the castle has served as a prison, a hospital, an asylum for the insane, and a refuge for idiot children.

HUBLI, a town of Dharwar in the presidency of Bombay, stands on a good road leading to Karwar on the Malabar coast, 102 miles to the southwest. It contains (1891) 36,677 inhabitants, and is one of the principal cotton-marts in that section of India.

HÜBNER, JOSEPH ALEXANDER, baron, born at Vienna, Nov. 26, 1811. He was educated in Vienna, subsequently traveled in Italy, and on his return, in 1833, entered the service of the government. His diplomatic career began at Paris in 1837. After several minor appointments, he was ambassador there from 1849 to 1859, and was at the head of the Austrian embassy at Rome, from 1866 to 1867. Possessed of consummate ability and tact, he has managed many delicate and difficult matters. He has twice visited the United States, the second time in 1871, when he went around the globe.

HÜBNER, RUDOLF JULIUS BENNO, German painter, was born at Oels, in Silesia, Jan. 27, 1806. He studied at Düsseldorf, to which school of painting he belongs. In 1841 he was appointed professor of painting in the academy at Dresden, and was director of the picture-gallery from 1871 to 1882, in which year he died, Nov. 7, at Loschwitz, near Dresden. Among his pictures are *Job and his Friends*, *Charles V. in San Yuste*, *Frederick the Great in Sans Souci*, *The Golden Age*, and *The Dispute between Luther and Dr. Eck*. He also designed glass paintings, including some for the crypt of Glasgow Cathedral.

HUCKABACK, often shortened to "huck," a coarse kind of linen cloth, figured somewhat like damask, and used especially for table-cloths and toweling.

HUDSON, a post-village of Middlesex county, Mass., 17 miles northeast of Worcester. Shoes and pianofortes are manufactured here. Pop. 4,670.

HUDSON, a post-village of Lenawee county, Mich., 50 miles west of Toledo, Ohio. Carriages, spokes and butter-tubs are manufactured here.

HUDSON, a city and county-seat of St. Croix county, Wis., on St. Croix Lake, 18 miles east of St. Paul, Minn. It contains wheat warehouses, flour-mills, machine-shops, and manufactories of plows and wagons. Pop. (1890), 2,885.

HUDSON, CHARLES THOMAS, M.A., LL.D. (Can tab.), F.R.S., was born at London, England, in 1828. He entered St. John's College, Cambridge, in 1848, and was 15th Wrangler in 1852. He was President of the Royal Microscopical Society in 1888, 1889 and 1890, and elected a Fellow of the Royal Society in 1889. He is joint author with Mr. P. H. Gosse, F.R.S., of *Hudson and Gosse's Rotifera*, and is the discoverer of *Pedalion mirum*, and of numerous new genera and species of Rotifera.

HUDSON, HENRY NORMAN, an American essayist, born at Cornwall, Addison county, Vt., in 1814, died at Cambridge, Mass., in 1886. He graduated at Middlebury in 1840, and taught school in Kentucky

and Alabama for some time. At Huntsville, Ala., a lady teacher from New England advised him to read Shakespeare, and his enthusiasm eventually resulted in the endowment of a professorship of Shakespeare in Boston University.

HUDSON BAY, a gulf or inland sea, in the north-east of North America. It is completely landlocked except on the north, where Southampton Island and Fox Channel lie between it and the Arctic Ocean, and where Hudson Strait, running 500 miles southeast, connects it with the Atlantic. Including its southeastern extension, James's Bay, it measures about 1,000 miles in length, and 600 in average width, and has an area of some 500,000 square miles. The eastern shore, called the East Main, is for the most part rocky, and is fenced with several small islands; the western shore, the West Main, is generally flat. This sea is the great drainage reservoir of the Canadian northwest territories. Of late years a movement has been on foot for opening up a direct communication from England with Manitoba, and the northwest of Canada by way of Hudson Bay and strait. The scheme provides for a railway from Winnipeg to Fort Nelson, on the bay, a distance of 650 miles, of which 40 miles were constructed by the end of 1890. The chief objection to the project is that the strait is only navigable for about three months annually. This route would effect a saving of 775 miles as compared with the route by way of Montreal, and of 1,150 as compared with that by New York.

HUEFFER, FRANCIS, musical critic and Provençal scholar, was born at Münster, in Westphalia, in 1845, studied at Berlin, Leipzig, and Paris, and settled in London in 1869. He soon became an authority on music, was musical critic of the "Times," and was recognized as the champion in Britain of Wagner and Wagnerian music at the time when the Wagnerian controversy was at its height. In 1869 he edited the Provençal poet, Guillem de Cabestan, and in 1878 published *The Troubadours; a History of Provençal Life and Literature in the Middle Ages*. Two works on Wagner were from his pen—one in 1874, the other in the "Great Musician" series, in 1881. He died January 19, 1889.

HUGER, BENJAMIN, an American general, born at Charleston, S. C., 1806. After graduating at West Point, he became a captain of ordnance in 1832, and was made chief of ordnance to Gen. Scott's army in the Mexican war. In 1855 he became major U. S. A.; but in 1861 he entered the Confederate service as brigadier-general and rose soon to be major-general. As such he commanded at Norfolk when the National forces captured the place, May 10, 1862. Huger quickly withdrew, after having fired the navy-yard; the *Merrimac*, and some other vessels. Subsequently he led a division in the seven days' fight in front of Richmond. After the war he became a farmer in Virginia.

HUGGINS, WILLIAM, an English astronomer and spectroscopist, born in London, Feb. 7, 1824, and educated at the City school and by private instructors, giving much attention to the experimental study of the physical sciences and of astronomy. In 1852 he was elected a member of the Microscopical Society, and was for several years engaged in the study of physiology, animal and vegetable, with the microscope. In 1855 he built a private observatory at Upper Tulse Hill, near London, and began what proved to be the principal work of his lifetime—his well-known spectroscopic observations and photographing of stellar spectra, the solar corona, etc. Mr. Huggins is a member of various scientific societies; was president of the Royal Astronomical Society from 1876 to 1878, and President of the British Association for 1891.

HUGHES, BALL, sculptor, born in London, England, January 19, 1806; died in Boston, Mass., March 5, 1863. He studied for seven years with a modeler and sculptor, and exhibited specimens of his work at the London Society of Arts, for which he received several silver medals. Among these achievements was an original composition, *Pandora Brought to Earth by Mercury*, which gained him a gold medal. He afterward made a number of ideal statuettes and many busts. In 1829 he went to New York city, and began work by making a statue of Alexander Hamilton, which was placed in the rotunda of the merchants' exchange. He also made a monumental relief of Bishop Hobart, now in the vestry of Trinity Church. Later, Mr. Hughes went to Dorchester, Mass., where he modeled *Little Nell*, and *Uncle Toby* and *Widow Wadman*, which are preserved in plaster at the Boston Athenæum.

HUGHES, DAVID EDWARD, F.R.S., was born in London in 1831. He subsequently emigrated with his parents to the United States. He is one of the greatest living experts in mechanics and the physical sciences. His career dates from 1850, when on account of his great musical talents he was appointed professor of music at the college of Bardstown, Ky. His first great invention was that of the printing telegraph which bears his name, which in 1855 became a practical success. He failed to introduce the invention into England, but it was adopted in the United States, and by the French, Italian, Russian and numerous foreign governments. In 1878, Professor Hughes invented the microphone, in 1879 the induction balance. In 1880 he was elected a Fellow of the Royal Society. In 1881 he represented Great Britain as one of the commissioners at the Paris Electrical Exposition. He has received numerous orders of knighthood, medals and diplomas from foreign governments and learned societies. His microphone is now universally employed as transmitter to the telephone.

HUGHES, REV. HUGH PRICE, a celebrated Wesleyan preacher, who was born in 1847, at Carmarthen, South Wales. He was educated at University College, London. His first appointment was at Dover, and he preached afterwards at Brighton, Oxford and London. He was then appointed to his present position as superintendent of the West London Mission. He has been exceedingly zealous in all kinds of social reforms. He published several works looking to this end. He is the editor of the "Methodist Times," an active worker in the cause of total abstinence, and a permanent member of the Methodist conference.

HUGHES, JOHN (1797-1864), an American Roman Catholic archbishop, born at Annaboghan, County Tyrone, Ireland, in 1797. After emigrating to America he worked first as a gardener; then studied theology at Mount St. Mary's College, Emmitsburg, Md., where he supported himself by taking care of the college garden, and afterwards by teaching in the college. As priest he had charge of some churches in Philadelphia till 1838, founded St. John's Orphan Asylum, and established the "Catholic Herald." In 1842 he became bishop of New York. He then organized the Roman Catholics against New York's public school system and instituted a system of parochial schools. In 1850 the diocese of New York had so increased by immigration that Hughes was made archbishop. During the war he used his influence in behalf of the integrity of the Union. Secretary Seward sent him and Thurlow Weed to Europe in 1861, to set before the foreign governments the true object in conducting the war, and during the draft riots in 1863 he urged upon the excited population of New York

the duty of submission to the United States Government.

HUGHES, THOMAS, author of *Tom Brown's School Days*, born at Uffington, Berks, England, Oct. 23, 1823. He was educated at Rugby under the celebrated Dr. Arnold, and at Oxford. Called to the bar in 1848, he became queen's counsel in 1869, and was in Parliament from Lambeth from 1865 to 1868, and from Frome in 1869 to 1874. He became early associated with the work of social and sanitary reform among the London poor, and took a prominent part in the debates relating to trades-unions and the law of master and servant. His best known work, *Tom Brown's School Days* (1856), is a truthful picture of life at Rugby, written from the author's own boyish impressions. It was followed by *The Scouring of the White Horse* (1858); *Tom Brown at Oxford* (1861); *Alfred the Great* (1869). In 1880 he assisted in founding a settlement in the United States, an account of which he published under the title of *Rugby, Tennessee* (1881). He has also written lives of Daniel Macmillan (1882), and Bishop Fraser (1887).

HUGO, VICTOR MARIE, VICOMTE, a French poet and romance writer, born at Besançon, Feb. 26, 1802, died May 22, 1885. His father being a general in Napoleon's army, young Hugo's childhood was chiefly spent in moving from France to Italy, and from Italy to Spain, but he received, nevertheless, an excellent education. At fourteen he produced a tragedy; at twenty published his first set of *Odes et Ballades*, and with the publication of *Cromwell*, in 1827, his reputation was established throughout France. In 1831 he published *Nôtre Dame de Paris*, and his best play, *Marion Delorme*. These were followed by *Le Roi s'amuse* (1832); *Lucrèce Borgia*, (1833); *Ruy Blas* (1838); and *Hernani* (1839); and the two celebrated volumes of lyric verse, *Les Feuilles d'Automne* (1831), and *Les Voix Intérieures*, in 1837. After the publication of *Les Rayons et les Ombres*, in 1840, Hugo attempted but little in pure art for a number of years, devoting himself to the pursuit of politics and the practice of oratory, journalism, and pamphleteering in prose and verse. Until 1830 he was a royalist; between 1830 and 1848 he was a Napoleonist, with a turn for humanitarianism; and later, as a member of the Assemblée Législative, threw in his lot with the democratic republicans. In 1852, after the coup d'état, he withdrew to Jersey, and in his exile wrote *Napoléon le Petit*; *Les Châtiments*, a great achievement in political and personal satire; *Les Contemplations*; *Légende des Siècles*; and in 1862 his masterpiece in prose, *Les Misérables*. These were followed by *William Shakespeare*, 1864; *Les Chansons des Rues et des Bois*, 1865; *Les Travailleurs de la Mer*, and *L'Homme qui Rit*. After the 4th of September, 1870, Hugo returned to France, and a few months later was chosen to represent the department of the Seine, but soon resigned his seat. In 1876 he was made a senator. Among his later works are *L'Année Terrible*, 1872; *Quatre-Vingt-Treize*, 1874; *Histoire d'un Crime*, 1877; *Le Pape*, 1878-79; *L'Ane*, 1880; *Les Quatre Vents de l'Esprit*, 1881, and *Torquemada*, 1882.

HULL, ISAAC, an American naval officer, who greatly distinguished himself in the war with Great Britain in 1812. He was born at Derby, Conn., March 9, 1775. In 1798 he became lieutenant and served with credit in the West Indies and the Mediterranean. For his capture of the *Guerriere* he was given a gold medal by Congress. He died Feb. 13, 1843.

HULL, WILLIAM, an American general, born at Derby, Conn., in 1753, died at Newton, Mass., in 1825. He studied law and was admitted to the bar in 1775. He joined the American army at Cam-

bridge as captain, fought at White Plains, Trenton and Princeton, and was then promoted to be major. Afterwards he was engaged at Ticonderoga, Stillwater, Saratoga, Monmouth and Stony Point. After the war he practiced law at Newton, Mass., and was prominent in the Massachusetts legislature. In 1798 he was appointed judge of the court of common pleas, and in 1805 he became governor of Michigan Territory. At the outbreak of the war of 1812 Hull commanded the northwestern army, consisting of raw militia. He had to yield up Detroit and the entire Northwest to the English. For this he was court-martialed and sentenced to be shot, but President Madison pardoned him on account of past services. In 1824 he published the *Campaign of the Northwest Army*. His *Life* was published by his daughter, Mrs. M. Campbell.

HULL, PROF. EDWARD, director of the geological survey of Ireland and professor of geology in the Royal College of Science, Dublin, was born in Antrim, Ireland, May 21, 1829. He early developed a taste for geological studies, to which he determined to devote his life. He was appointed on the Irish survey in 1869, from which he did not permanently retire until its completion in 1890. During the intervening years he visited Arabia, Persia and Palestine, and made a geological and topographical survey of the Arabah Valley and adjoining territories between the Sinaitic Peninsula on the south and Southern Palestine on the north. Prof. Hull has contributed largely to scientific literature.

HULLAH, JOHN PYKE, an English musical composer, born at Worcester, June 27, 1813, died in London Feb. 21, 1884. He studied at the Royal Academy of Music, and in 1840 began popular singing-classes in London, continuing the work for over 20 years. He was for some time professor of vocal music in King's College, and from 1874 to 1882 was inspector of training-schools for the United Kingdom. His comic opera, *The Village Coquette*, was published in 1886. Of his songs, *The Three Fishers* and *The Storm* attained wide popularity.

HUMBERT I., RENIER CHARLES EMMANUEL JEAN MARIE FERDINAND EUGENE, KING OF ITALY, born March 14, 1844, being the son of Victor Emmanuel. He attended his father during the war of Italian independence in 1859. In 1866, when Italy fought with Austria, the prince took the field as commander of a division in Gen. Cialdini's army, and was present at the disastrous battle of Custoza, June 23, 1866. After Rome was occupied in 1870 by the Italian troops, he took up his residence there, and upon the death of his father, Jan. 9, 1878, succeeded to the throne of Italy. In November of the same year an attempt was made to assassinate him, but failed. When the would-be assassin was condemned to death Humbert commuted his sentence to imprisonment at hard labor. During the cholera epidemic at Naples he exposed himself frequently in his endeavors to alleviate the sufferings of the sick and dying. By these and other actions of kindness and sympathy the king won the affection of the Italian people.

HUMBOLDT, a post-village of Humboldt county, Iowa, the seat of Humboldt College. Liquor and gambling saloons are rigidly excluded from the village. Pop. (1890), 1,075.

HUMBOLDT, a city of Allen county, Kan., situated on Neosho River, 86 miles from Lawrence. It is a railroad junction and has various manufacturing. Pop. (1890), 1,367.

HUMBOLDT, a city of Richardson county, Neb., on the Big Nemaha River and on the Atchison and Nebraska Railroad, 21 miles northwest of Falls City. Pop. (1890), 1,114.

HUMBOLDT, a railroad junction of Gibson county, Tenn., situated 128 miles west of Nashville. It has mills and a foundry, and educational institutions supervised by Odd Fellows. Pop., 1,837.

HUME, PATRICK (1641-1724), an eminent statesman and covenanter, lord chancellor of Scotland, who in 1690 was created Lord Polwarth, and in 1697 Earl of Marchmont.

HUMERAL, an oblong scarf worn by priests and sub-deacons round their shoulders at certain parts of the service of the mass and of benediction, the paten, pyx, or monstrance, being also wrapped in it (so as to prevent contact at those times with naked hands).

HUMPHRY, SIR GEORGE MURRAY, an eminent English anatomist, was born July, 1820, at Sudbury, Suffolk, England. He became professor of anatomy in 1866 at St. Bartholomew's hospital at Norwich. He was made professor of surgery at Cambridge in 1883. He is the author of several treatises on surgery. He was knighted in 1884.

HUMPHREY, HEMAN, an American clergyman, born at West Simsbury, Conn., in 1779, died at Pittsfield, Mass., in 1861. He studied theology at Yale College, and was a Congregational pastor at Fairfield, Conn., from 1807 to 1817, and then in Pittsfield. From 1823 to 1845 he was president of Amherst College, to the character, growth and prosperity of which he largely contributed.

HUMPHREYS, ANDREW ATKINSON (1810-83), an American general and engineer, born at Philadelphia. As lieutenant of artillery he distinguished himself in the Florida war in 1835. In 1838 he became first-lieutenant of Topographical Engineers. From 1845 to 1849 he had charge of the Coast Survey Office, and afterwards began the topographic and hydrographic survey of the delta of the Mississippi. This work he resumed in 1857, after he had examined the river deltas in Europe and studied the means employed there for protection against inundations. During our civil war he became a brigadier-general, was engaged at the battles of Fredericksburg, Chancellorsville and Gettysburg, and commanded a corps in the siege and capture of Petersburg, and in the pursuit and capture of Lee's army. In 1866 he was engaged in engineering work on the Mississippi.

HUMPHREYS, DAVID, an American general born at Derby, Conn., in 1752, died at New Haven in 1818. In the Revolutionary war he was aide-camp to Gen. Putnam, and then to Gen. Washington. He distinguished himself at the siege of Yorktown in 1781. In 1784 he went to Paris and London as secretary of legation to Benjamin Franklin, John Adams and Thomas Jefferson, who negotiated treaties of commerce and amity with European powers. In 1790 President Washington appointed him minister to Portugal, where he remained till 1794. In 1797 he was transferred to the court at Madrid as minister plenipotentiary, where he stayed till 1802. On his return from Spain he imported 100 merino sheep, and for some time thereafter he engaged in the manufacture of woollens at Derby. In the war of 1812, Humphreys commanded the Connecticut troops as brigadier-general. Humphreys was noted as a poet and wit. He helped in producing the *Anarchaid*, and other satiric verse; he also published *An Address to the Armies of the United States*, and other poems.

HUNGARIAN POLITICAL PARTIES. The legislative power of Hungary is vested in the emperor of Austria as king of Hungary, the delegations and a Reichstag, consisting of a house of magnates and a house of representatives. The former comprises 286 hereditary peers, some

50 high ecclesiastical dignitaries of the Roman Catholic, Greek and Protestant churches, 82 life-peers, all the archdukes who have attained their majority, delegates from the diet of Croatia-Slavonia, and others—460 magnates in all. The house of representatives contains 453 members, elected by open voting and limited suffrage for periods of five years. The present house was elected in June, 1892. The parties are distinguished as Liberals, Moderates, Independents, the Croatian delegates, who usually vote with the Liberals, and Nationalists, who vote now with one party and now with another. The Liberals number 250; the Independents, who aim at the liberation of Hungary from all but the monarchical tie with Austria, are 80; and the Moderates, numbering 56, accept the constitution of '67. Until 1890 M. Tisza commanded the support of the majority in the chamber, but finding his authority waning after fifteen years' leadership he has now retired, and sits as a simple deputy, his place at the head of the ministry being taken by his colleague, Count Szapary, who was minister of agriculture in the Tisza cabinet.

HUNT, ALFRED WILLIAM, an English painter, was born in Liverpool in 1830. He first exhibited in the Royal Academy in 1854, became a member of the Hogarth Club and was the center of the pre-Raphaelite force. Mr. Hunt is generally considered to be one of the most distinguished followers of Turner, and the chief upholder of the system of landscape art which endeavors to unite truth of light and poetical feeling with fidelity to nature.

HUNT, HENRY JACKSON, born in Detroit, Mich., September 14, 1819; graduated at West Point in 1839, served on the Canadian frontier, and distinguished himself in Mexico, where he was twice wounded. He became captain in 1852, and major in 1861, held an artillery command at Bull Run, and became aide to McClellan. In September, 1862, he was made brigadier-general of volunteers. As chief of artillery of the army of the Potomac he fought at Gettysburg, in the army of the Rapidan to Petersburg, and became brigadier and major-general, United States army. He was president of the artillery board, was retired from active service in September, 1883, and became governor of the Soldiers' Home at Washington, D. C. He died February 11, 1889.

HUNT, LEWIS CASS, born in Wisconsin, February 23, 1824; graduated at West Point in 1847, served on the Pacific coast, and in the Peninsular campaign of 1862. He was wounded at Fair Oaks, received various brevets up to that of brigadier-general in the regular army, and served as colonel of infantry until his death in September, 1886.

HUNT, ROBERT, F. R. S., born September 6, 1807, at Devonport, England; is the keeper of mining records at the Museum of Practical Geology, and was the first appointed professor of mechanical science to the government school of mines. He is best known by his work on *Photography*, published in 1842; *Researches on Light*, *The Poetry of Science*, and *Panthea, or the Spirit of Nature*, 1849; *Elementary Physics*, 1851; and *Manual of Photography*, 7th ed., 1857; and is the editor of three editions of *Ure's Dictionary of Arts, Manufactures, and Mines*.

HUNT, THOMAS STERRY, an American chemist and geologist, born at Norwich, Conn., in 1826. He studied chemistry under Prof. Benjamin Silliman at Yale College. In 1847 he entered upon the duties of geologist and mineralogist in the geological survey of Canada under Sir William Logan. While holding this position he was for some years also professor of chemistry in McGill College, Montreal. In 1872 he became professor of geology in

the Massachusetts Institute of Technology. Prof. Hunt has published many important papers on chemistry, mineralogy, and geology, which have appeared in the "American Journal of Science," and in other scientific periodicals of both Europe and America.

HUNT, WILLIAM HENRY, born in Charleston, S. C., in 1824; was educated at Yale and practiced law in New Orleans. In March, 1876, he was appointed attorney-general of Louisiana, and in the fall of the same year was the Republican candidate for the same office. There was a dispute over the election, and the Hayes administration recognized the Democratic contestants. In 1878 Mr. Hunt was appointed judge of the court of claims, and in March, 1881, he became secretary of the navy in the Garfield cabinet. This position he held until 1882, when he was appointed United States minister to Russia. He died in St. Petersburg, Feb. 27, 1884.

HUNT, WILLIAM HOLMAN, an English painter, born in London in 1827. Admitted a student of the Royal Academy in 1845, he exhibited his first picture in the following year. In his earlier work he generally took his subject from one of the poets. The first of his work executed in the pre-Raphaelite manner was *A Converted British Family Sheltering a Christian Missionary from the Persecution of the Druids*. Other works are: *Our English Coasts* (1853); *The Light of the World* (1852-54); and *The Awakened Conscience* (1854). The result of several prolonged visits to the East appeared in *The Finding of Christ in the Temple* (1854); *The Shadow of Death* (1874) and the *Triumphs of the Innocents*, executed in two versions (1875-85). In 1888-89 he painted *The Choristers of Magdalen College, Oxford, Singing the May-day Hymn*. An important mosaic by Mr. Hunt, entitled *The Child Jesus in the Temple*, intended for Clifton College chapel, was exhibited in 1890.

HUNT, WILLIAM MORRIS, an American painter, born at Brattleboro, Vt., in 1824, died at Isles of Shoals, N. H., in 1879. In 1846 he entered the Royal Academy at Düsseldorf, for the purpose of studying sculpture. But after a few months he removed to Paris to become a pupil of Couture in painting. Having returned to America in 1855, he opened studios both at Boston and Newport, settling finally at Boston, where he taught painting with great success.

HUNTER, DAVID, an American soldier, born at Washington, D. C., in 1802, died there in 1886. After he became a captain of dragoons, in 1833, he was assigned to frontier duty, and twice crossed the plains to the Rocky Mountains. In the Mexican war (1846) he was chief paymaster of General Wood's command. When President-elect Lincoln went to Washington in February, 1861, Hunter accompanied him. On May 14, 1861, he became colonel of the 6th United States cavalry. During the war he commanded a division at Bull Run, where he was wounded. In August, 1862 he became major-general of volunteers, and successively commanded the Western and Southern military departments. To provide for the fugitive slaves, General Hunter organized the 1st South Carolina volunteers, which was the first regiment of black troops in the National service. Upon this, Jefferson Davis issued a proclamation declaring Hunter an outlaw, who, if captured, should not be treated as a prisoner of war, but held in close confinement and executed as a felon. In May, 1864, Hunter was placed in command of the department of West Virginia. He defeated a Confederate force at Piedmont, on June 5, 1864.

HUNTER, ROBERT MERCER TALIAFERRO, an American statesman, born in Essex county, Va., in 1809, died there in 1887. After studying law at the

Virginia University, he was elected to Congress in 1837 and was chosen speaker in 1839. In 1845 he was again returned to Congress, and in 1847 he entered the United States Senate, where he was a leading advocate of States' rights till July, 1861, demanding the right of the slaveholder to carry his slaves to any United States territory. Being an active Secessionist he became secretary of State in the Confederate cabinet, but was soon superseded by J. P. Benjamin. After this he was elected to the Confederate Senate, and became an opponent of Jeff. Davis's administration. In 1885 he was appointed a collector of customs by the United States Government.

HUNTER, SIR WILLIAM WILSON, born July 15, 1840; educated at the universities of Glasgow, Paris and Bonn; in 1862 entered the civil service of India, and after filling the offices of secretary to the government of Bengal and to the supreme government of India, was in 1871 appointed director-general of the statistical department of India. He was one of the first recipients of the order of the Star of India, in 1878, and in 1887 was knighted. Sir William Hunter has also received honorary degrees from the Universities of Oxford, Cambridge and Glasgow, and is a member of many learned societies in Europe and Asia.

HUNTER, SIR WILLIAM GUYER, K.C.M.G., M.P., eldest son of the late Mr. Thomas Hunter, of Catterick, Yorkshire, was born in 1831, and educated at King's College, London, at Aberdeen University, and at various hospitals. He entered the Indian medical service, Bombay presidency, in 1850, and served through the Burmese war and the Indian mutiny. In 1876 he was appointed principal of the Grant Medical College; and in 1879 vice-chancellor of the University of Bombay. He retired in 1880, and in 1883 went out to Egypt to serve on the cholera commission. For his services on this occasion he was made a K.C.M.G. In 1885 he entered parliament as Conservative member for Central Hackney, and was again returned for the same constituency in 1886.

HUNTING AND GAME LAWS OF THE UNITED STATES. The "open seasons" for hunting the various kinds of game in the several States, as given in the following paragraphs, have been carefully compiled from the latest published reports of the State laws.*

ALABAMA. (Throughout the State, except in the counties named below.) Deer, October 20 to February 14; wild turkeys, October 20 to May 1; turtle doves, August 1 to April 1; quail, September 15 to March 15; wild ducks, October 1 to May 1. In Perry county—Deer, October 20 to February 14; wild turkeys, October 1 to May 1; doves, August 1 to March 1; quail, October 15 to March 1; wild ducks, October 1 to May 1; snipe and robin, not protected. In Green and Pickens counties—Deer, September 15 to February 1; wild turkeys, September 15 to April 15; doves, August 1 to April 1; quail, October 15 to March 15; wild ducks, October 1 to April 1. In Lamar county—Deer, October 1 to April 1; wild turkeys, October 1 to May 1. In Barbour county (beat 5)—Wild turkeys, October 20 to May 1; quail, September 15 to May 1; doves, August 1 to May 1. In Lawrence county—Deer, partridge, quail, rabbit, September 1 to April. Possession and transportation of game limited to open season.

Night-shooting and use of sneak-boats in hunting wild ducks forbidden.

ARKANSAS. Wild duck, doe, fawn, September 1 to February 1; wild turkeys, September 1 to May 1; pinnated grouse, September 1 to February 1; quail, October 1 to March 1. Possession of game during close season prohibited. Taking grouse, quail or prairie chickens with nets, etc., except on one's own land, forbidden. Use of nets at mouths of streams, etc. (except minnow seines), prohibited.

CALIFORNIA. Quail, partridge, grouse, rail, September 10 to March 1; doves, June 1 to January 1; male antelope, deer, July 1 to December 15; female antelope, elk, mountain

*The reader is also referred to an extended work on *The Law of Field Sports* prepared by Geo. Putnam Smith, of the New York "Sun."

sheep, doe, spotted fawn, absolutely protected; netting quail, partridge or grouse, prohibited; speckled trout, brook or salmon trout, April 1 to November 1; salmon, except when caught with net or seine, between sunrise on Saturday and noon on Sunday, which is in that event, close season, September 1 to July 31; shad, December 31 to April 1. Possession of game during close season prohibited.

COLORADO. Partridge, pheasant, prairie chicken and grouse, October 1 to November 15; elk, deer, buffalo, antelope, October 15 to January 1; mountain sheep, protected until April 7, 1885; trout, or other food fish, July 1 to November 1. Possession of game restricted to open season, but dealers may import from other States. Netting or trapping game animals or fish forbidden; also the killing of any wild animal merely for its skin, forbidden; also the killing of more animals than are needed for food, forbidden. Birds, except the above named four, are protected.

CONNECTICUT. Wood-cock, quail, partridge, gray squirrel, October 1 to January 1; wild duck, geese, November 1 to May 1; bobolink, rice-bird, robin, lark, September 1 to February 1; rail, September 1 to January 1. In New Haven, Fairfield and Litchfield counties, August 20 to January 1; trout, July 1 to April 1. Possession of game restricted to the open season. Wood-cock, ruffed grouse and quail must not be carried out of the State. It is unlawful to hunt with gun and dog within the inclosed premises of another, whether persons or corporations, without permission from the owner, agent or occupant thereof, provided such owner shall have placed six printed signs or notices, in six different conspicuous places on said premises, each board notice to be at least one foot square, and the letters to be plainly made. §6. Any person violating section five of this act shall be deemed guilty of a misdemeanor, and shall be fined not less than \$7, nor exceeding \$25, exclusive of any damage by trespass.

Insectivorous birds, including robin and lark, can be killed only on one's own land.

DELAWARE. Oortolan, rail, reed-bird, September 1 to January 1; pheasants, quail, wood-cock, hares, rabbits, November 15 to February 15. In Kent, Sussex and Newcastle counties, November 15 to January 15. Possession of game limited to open season. Transportation of partridges, quail, wood-cock or rabbits, killed in the State, for sale out of the State, forbidden. Night-shooting, netting or trapping game; use of ferrets, or of artificial light to catch muskrats, forbidden. Non-residents may not kill game or game fish without license from the Delaware Game Protective Association. Any non-resident found trespassing upon any private property with either dog or gun, not having license from the Delaware Game Protective Association, is liable to be arrested where found trespassing, on a charge of misdemeanor, and fined \$20, and in default of payment, imprisoned not less than ten nor more than twenty days.

DISTRICT OF COLUMBIA. Partridge and quail, November 1 to February 1; pheasant, August 1 to February 1; wood-cock, July 1 to February 1; prairie chicken, September 1 to February 1; snipe and plover, September 1 to May 1; wild duck, wild goose, and wild brant, September 1 to April 1; water-rails, ortolan, reed-bird, and deer, September 1 to February 1; deer, August 15 to January 15; shad and herring, January 1 to June 1. Possession of game during close season prohibited. During fishing season, viz., from January 1 to May 30, there is a close season every week, beginning at sundown on Saturday and ending at midnight on Sunday—during which time all nets, seines, etc., must be taken from the water. Trapping and snaring of wild birds and water fowl; use of gun other than shoulder gun for shooting and killing wild duck, wild goose, and wild brant; killing or shooting any bird or wild fowl in the night-time; shooting or carrying a gun in the open air on Sunday; taking black bass and salmon by other means than by hook and line, prohibited.

FLORIDA. Deer, wild turkeys, quail, partridge, in all the counties wherein the county commissioners have published the law, September 1 to April 1. Sea-birds and birds of plumage, protected at all times. Non-residents desiring to hunt game of any kind, must obtain license from clerk of county where they wish to hunt, paying therefor \$25. Not more than five persons may be included in one license, and for each additional person, \$5. No one, except a citizen of the United States, can kill birds for their plumage on any lands or waters of the State or within a marine league of the coast.

*The Act of Congress of June 15, 1878, also provides as follows:

Sec. 15. Enacts that any person who shall knowingly trespass on the lands of another for the purpose of shooting or hunting thereon, after due notice, or notice as provided for in the following section by the owner or occupant of lands, shall be liable to such owner or occupant in exemplary damages to an amount not exceeding \$100, and shall also be liable to a fine of \$10 for each and every trespass so committed. The possession of implements of shooting on such lands shall be presumptive evidence of the trespass.

Sec. 16. That the notice referred to in the preceding section shall be given by erecting and maintaining sign boards at least 8 by 12 inches in dimensions on the borders of the premises, and at least two such sign boards for every 50 acres. Penalty for erecting and maintaining such sign boards is not less than \$25, nor more than \$25 for each such sign board, and the eggs, nests and young of wild birds protected.

It is unlawful to hunt or fish upon the lands of another, without permission of the owner or occupant, under a penalty not to exceed \$20, or imprisonment, though ten days' notice by poster must be given, and such notice must be posted in three conspicuous places around the premises sought to be protected.

GEORGIA. Wild turkey, partridge, October 15 to April 1; summer ducks, doves, August 15 to April 1; wood-cock, August 15 to January 1; insectivorous birds, October 1 to April 1; buck, November 1 to March 1, and May 1 to September 1; doe, fawn, July 1 to January 1; snipe, October 1 to March 1. Possession of game during close season, prohibited. Trapping or snaring of game or birds, prohibited. In this State there are numerous local laws which affect particular counties, and which vary considerably in their provisions—so much so as to make it important that hunters should examine the local law of the county embracing their selected hunting ground.

ILLINOIS. Wild duck and goose, August 1 to April 15; prairie chicken, sage-hen, grouse, pheasant, July 15 to February 1; buffalo, elk, antelope, mountain sheep, September 1 to January 1. In Ada county, grouse, prairie chicken and duck, September 1 to March 1. Taking fish, except with rod or pole and hook and line, prohibited.

ILLINOIS. Deer, wild turkeys, September 1 to January 15; pinnated grouse, August 15 to December 1; ruffed grouse, quail, October 1 to January 1; wood-cock, July 4 to January 1. Possession of game limited to five days after season closes. Black and other bass, salmon and other game fish can be caught with hook and line only from February 15 to June 15. Use of explosive or medicinal compounds to catch fish, netting and trapping game birds (except wood-cock), night shooting of wild fowl, forbidden. No person who has not resided 60 days in the State may kill wild game. None but residents of Bend, Fayette, Effingham, Marion, Clay, Richmond, Hamilton, Wayne, Warren, Henderson and Jersey counties may kill deer or game birds for sale out of these counties.

INDIANA. Deer, October 1 to January 1; quail or pheasant, October 15 to December 20; wild turkeys, November 1 to February 1; prairie hens or chickens, September 1 to February 1; wood-cock, July 1 to January 1; wild duck, September 1 to April 15; fish (with gig or spear), January 1 to March 1. Fishing with hook and line allowed at all times and all places. Possession of game limited to open season. Fishing in the St. Joseph and Kankakee Rivers allowed in any manner between April 1 and June 1. In the Ohio River without any restrictions. Netting or trapping quail, pheasant, prairie chickens or wild duck of any kind or variety prohibited. Taking fish with net or seine, gun or trap of any kind, or set-net, wire, or pot in any of the lakes, ponds, rivers or small streams, except in the Ohio, St. Joseph and Kankakee Rivers, prohibited. Shooting at wild pigeons at or within half mile of any pigeon roosting or nesting (when they are nesting) prohibited. Trespass on inclosed lands is punishable by a fine.

IOWA. Pinnated grouse, September 1 to December 1; wood-cock, July 10 to January 1; ruffed grouse, quail, wild turkeys, October 1 to January 1; wild ducks, geese, brant, August 15 to May 1; deer and elk, September 1 to January 1; beaver, mink, otter, muskrat, November 1 to April 1; bass and wall-eyed pike, June 1 to April 1; salmon and trout, February 1 to November 1. No fish but minnows may be caught from July 1 to October 1. Twenty-five of each kind of game may be taken for five days after season closes. Transportation of game restricted to within the State, and one dozen in any one day from any one person to any other one. Trapping game, birds, deer or elk; use of any but shoulder gun; use of poison for birds or fish; spearing or gaffing fish from November 1 to May 31 are forbidden. No one shall in one day kill more than 25 each of quail, wood-cock, prairie chickens and pheasants.

KANSAS. Pinnated grouse, September 1 to January 1; quail, November 1 to January 1. Insectivorous birds—Wild geese, ducks, hawks, harrier, blue-jay, crow, snipe, curlew, plover, piper, bittern, heron, crane and wood-pecker not protected. Possession of game allowed ten days after season closes. Snaring of game or game fish, hunting with explosive substances without owner's consent; killing fish by explosive substances forbidden. All birds protected except wild geese, ducks, hawk, harrier, blue-jay, crow, snipe, curlew, plover, piper, bittern, heron, crane and wood-pecker.

KENTUCKY. Deer, September 1 to March 1; quail, partridge, pheasant, October 1 to March 1; wild turkey, wild duck, teal or other duck, September 15 to May 1; wood-cock, June 1 to January 1; wild turkey, September 1 to February 1; squirrels, January 15 to February 1. Taking fish by any other contrivance except hook and hand-line prohibited. Possession of game limited to close season. Trapping game animals; taking fish with net or other contrivance (except trotlines and gigs and minnow-nets), or use of any deleterious substance or explosive agent, except in the Ohio and Cumberland Rivers, below the mouth of Rockcastle River, and lakes in the Ohio and Mississippi River bottoms prohibited.

*The Kentucky law also enacts that any person knowingly trespassing upon the land of another for the purpose of hunting or fishing, after public notice by the owner or occupant is liable to such owner or occupant to an amount not exceeding \$25, besides all actual damage said owner or occupant

LOUISIANA. Buck, doe, fawn, October 1 to March 1; wild turkey, October 1 to April 15; quail, partridge, pheasant, October 1 to April 1. Possession and transportation of game during close season prohibited. Insectivorous and song birds protected, unless they prove destructive to fruit or grain crops.

MAINE. Moose, deer, caribou, October 1 to January 1; mink, beaver, sable, otter, fisher, muskrat, October 15 to May 1; wild ducks, September 1 to May 1; ruffed grouse, woodcock, September 1 to December 1; quail, pinnated grouse, September 1 to January 1; plover, August 1 to May 1; salmon, April 1 to July 15; with hook and line, October 1 to April 1; landlocked salmon, trout, togue, May 1 to October 1; black bass, Oswego bass, white perch, July 1 to April 1. Possession of ruffed grouse, or partridge, and woodcock allowed during September, October and November to be consumed as food; of landlocked salmon, trout and togue during February, March and April. No person shall have in possession in open season more than one moose, two caribou or three deer. Possession of over 50 pounds of landlocked salmon, trout or togue at any one time for purpose of transportation prohibited. Transportation of game, birds or fish during close season prohibited. In Maine there are local laws which apply to particular lakes, ponds and rivers, and which require attention only to the localities. Hunting or killing moose, deer or caribou with dogs; taking of mackerel, herring, pogies and menhaden by use of purse or drag-net in small bays, inlets, harbors or rivers, and other objectionable methods of taking other kinds, mentioned in detail in the statutes, prohibited. No weir, hedge or set-net shall extend more than two feet depth of water at ordinary low water. Between April 1 and July 15 there shall be a weekly close of 48 hours between sunrise on each Saturday morning and sunrise on the ensuing Monday morning, during which time no salmon, shad, shayvines or bass shall be taken. During the close time all seines or other movable apparatus shall be removed from the water; but this does not apply to the Kennebec, Androscoggin or Penobscot Rivers, or their tributaries, or to St. Croix River below the breakwater at the ledge. Private fishing grounds may be protected by posting notices in the manner specially prescribed. Insectivorous birds are protected.

MARYLAND. Quail partridge, November 1 to December 24; woodcock, June 15 to February 1; pheasant, August 15 to January 1; rabbit, October 15 to January 15; squirrel, September 1 to December 25; plover, sand piper, November 1 to January 1; mink, otter, muskrat, December 15 to March 15; wild turkey, January 1 to September 15. Wild Water Fowl—No person shall, at any time, in, on or over the waters of the State of Maryland, shoot at, or shoot any water fowl banded in flocks, either upon the feeding or roosting grounds of said water fowl, or elsewhere, or from any vessel, boat, float, canoe or any craft of any kind whatever; nor shoot at any wild water fowl from any booby blind, or artificial point erected at a greater distance than 100 yards from the natural shore from which the same be extended; nor shoot any water fowl while flying above their breeding grounds, or elsewhere over the waters aforesaid, from any vessel, boat, float, canoe or craft of any kind—reserving, nevertheless, to any citizen of any county bordering on the waters aforesaid, and to whomsoever they may extend the privilege, the right to shoot from boats other than sink boats or sneak boats. Possession of game limited to open season. The above are State laws. There are in addition many local regulations, varying in the different counties.

MASSACHUSETTS. Woodcock, August 1 to January 1; ruffed grouse, October 1 to January 1; quail, October 15 to January 1; wood, or summer duck, black duck, or teal, or any of the so-called duck species, September 1 to April 15; pinnated grouse, protected at all times; plover, snipe, sand piper, rail or any of the so-called shore, marsh or beach birds, July 15 to May 1; wild, or messenger pigeon, gull and dove, September 1 to May 1; gray squirrel, hare, rabbit, September 1 to March 1; salmon, May 1 to August 1; trout, April 1 to October 1; smelts, June 1 to March 15; landlocked salmon, lake trout, April 1 to September 1; black bass, July 1 to December 1. Exception is made in the application of these restrictions to the Connecticut River and its tributaries. Possession of the above animals and birds prohibited during close season, except in case of quail, which may be held in possession from October 15 to May 1, and pinnated grouse, wild pigeons, and any of the so-called shore, marsh, or beach birds, or any of the so-called duck species, at any season, if not taken or killed within the State. Use of ferrets, battery or swivel guns, torch or jack-lights; netting or trapping game (except partridges, hares or rabbits, between September 1 and January 1, on one's own land or by leave of owner); killing deer in or within 200 yards of pond or river; killing at

any time prairie chicken, except on one's own land, and placed there by land-owner; use of deleterious substances or other means than rod and line to catch salmon, trout or bass, are forbidden. Owners of land may be protected by posting notices in the manner prescribed by statute.

MICHIGAN. Deer (in upper peninsula), August 15 to November 15; deer (lower peninsula), November 1 to December 1; wild turkeys, October 1 to January 1; woodcock, August 1 to January 1; ruffed grouse, wood, teal, mallard and gray ducks, September 1 to January 1; water fowl, snipe, September 1 to May 1; quail, November 1 to January 1; pinnated grouse, September 1 to November 1; trout, May 1 to September 1; grayling, June 1 to November 1. Possession of game allowed for eight days after season closes. No deer in red, or fawn in spotted coat, or any such skin of deer or fawn, can lawfully be possessed. Deer, ruffed and pinnated grouse, quail, and wild turkey, cannot be carried out of the State. Fish cannot be taken from fish lakes, Diamond and Stone lakes, or in any lake in Westervelt township from November 1 to April 1; nor in lakes of Kalamazoo county from March 1 to April 1; nor in lakes of Brance Lake, from December 1 to April 1. Spear- or shooting fish in these mentioned lakes; killing deer in the water or in trap or pit-fall; netting or trapping game birds; use of swivel or punt gun; shooting wild pigeons within five miles of pigeon nesting, forbidden; trespass on inclosed lands punishable.

MINNESOTA. Elk, moose, deer, November; quail, ruffed grouse, September 1 to December 1; wild duck, goose, September 15 to January 1; woodcock, July 4 to November 1; prairie chicken, white breasted or sharp-tailed grouse, August 15 to October 1; aquatic fowls, September 1 to May 15; speckled trout, April 1 to October 1. Possession of game limited to open season. Night shooting prohibited. Transportation of game out of State forbidden. Deer in Stearns county can be taken only from November 15 to December 15. Fish can be taken in Stevens county by hook and line only, and in Lake Ripley by hook and line only from March 1 to June 1. In Loon, Crystal, Lily, Madison and Miles lakes by hook and line only from March 15 to June 1. Game birds must be killed only by shooting; speckled, river, and brook trout must be taken with hook and line. No fish except white fish from any waters in the State except Lake Superior, the Mississippi, Minnesota, and St. Croix rivers can be taken except by hook and line, shooting or spear-.

MISSISSIPPI. Deer, September 15 to February 1; wild turkey, ruffed grouse, quail, October 1 to April 1; turtle doves, starlings, September 15 to February 1. In Tate county, open season for all game November 1 to March 1; in Jasper, and some other counties, wild turkey unprotected. Possession and transportation of game restricted to open season. In Jasper and some other counties wild turkeys are unprotected. In Madison and Jefferson counties, netting and trapping quail and partridge forbidden.

MISSOURI. Deer, September 1 to January 15; wild turkey, September 15 to March 1; pinnated grouse, ruffed grouse, quail, October 15 to February 1; woodcock, July 1 to January 1; turtle dove, meadow lark, plover, August 1 to February 1. Possession of game during close season, forbidden. Insectivorous birds protected. Taking of fish with traps, nets, pens or pits, pinnated grouse and quail; or disturbing the eggs of wild birds or their nests (except by owner on his own premises during open season); or poisoning waters; or using explosive substances for the purpose of taking fish; or taking fish by means of seine (except a very small one), net, gill-net, trammel-net, set-net, bag, weir, bush-drag, any fish-net or dam, or any other device or obstruction (unless by owner in waters wholly on his own premises), prohibited. Non residents are forbidden to hunt or trap deer, fawn, wild turkey, pinnated grouse, ruffed grouse, quail, woodcock, goose, brant, duck or snipe for purpose of marketing or removing same out of State. Trespass by any one on closed land punishable.

MONTANA. Buffalo, moose, elk, black or white tailed deer, antelope, mountain sheep, Rocky Mountain goat, August 15 to December 1; grouse, prairie chicken, pheasant, fool-hen, sage-hen, partridge, quail, August 15 to November 15; beaver, otter, marten, or fisher, October 1 to April 1; wild geese and ducks, August 15 to May 15. Killing any of the above birds for sale prohibited. Hounding deer, elk, moose, or mountain sheep; catching fish with other means than hook and line (except in Missouri River below Three Forks and the Yellowstone River below mouth of Clarke's Fork) and use of explosive or poisonous substances, forbidden. Game animals can be killed only for food, and their skins cannot be taken out of the territory.

NEBRASKA. Buffalo, elk, deer, antelope, mountain sheep, turkeys, and quail, October 1 to January 1; grouse, September 1 to January 1; mink and muskrat, February 15 to April 15; pinnated grouse, September 1 to January 1. Possession of game restricted to open season. Transportation of grouse, quail, turkeys, deer, buffalo, elk, and mountain sheep at any time prohibited. Insectivorous birds protected. Deer hounding forbidden in Burt, Washington, Douglas, Sarpy, Cass, Saunders and Dodge counties. Fishing, except with hook and line, use of other than shoulder guns for wild fowl, forbidden. Trespass on land to kill or take any animal or bird, and catching fish in any private pond not more than ten acres in area, punishable.

NEVADA. Partridge, pheasant, woodcock, quail, wild goose, wood duck, teal, mallard, or other ducks, sand hill

may suffer by such trespass—presence on the lands of another with dogs or implements of hunting or fishing is evidence of the purpose of trespass. The notice referred to shall be given by erecting and maintaining sign boards at least one foot square in at least two conspicuous places on each side of the premises intended to be protected, such sign boards to have thereon the word posted, and the name of the owner or occupant of the lands. Any person who shall tear down, destroy or deface any such sign board shall be fined not less than \$5 nor more than \$25.

cranes, brant, swan, plover, curlew, snipe, grouse, robin, meadow lark, yellow hammer, bittern, September 1 to April 1; sage-cock, hen, chicken (counties of Humboldt, Elko, Eureka, and Lander, excepted), August 1 to April 1; deer, antelope, elk, mountain sheep, goat, August 1 to September 1; trout, June 1 to January 1; but between April 30 and October 31 cannot be taken for purpose of sale. Possession of game during close season prohibited. Insectivorous birds protected. Trapping or netting quail; catching any fish otherwise than with hook and line (except for scientific purposes) prohibited. Protection to owner of grounds may be secured by posting notices in two places in town.

NEW HAMPSHIRE. Deer, moose, caribou, September 1 to December 1; mink, beaver, sable, otter, or fisher, October 15 to April 1; raccoon, gray squirrel, September 1 to January 1; hares, rabbits, muskrats, September 1 to April 1; plover, yellow leg, sand piper, wood-cock, duck, rail, August 1 to February 1; ruffed grouse, partridge, quail, September 1 to February 1; land-locked salmon, lake trout, brook or speckled trout, April 30 to September 30; but during January, February and March, lake trout may be taken with single hook and line only; pike, perch or white perch, July 1 to May 1; black bass, June 15 to April 30; muscalonge, pickerel, pike, or grayling, June 1 to April 1; possession of game during close season prohibited; insectivorous birds protected.

Taking of any fish from the Pemigewasset river near the State hatchery, in Holderness, anywhere between the abutments of the upper dam of Livermore Falls and Compton and extending one-half mile below the same, prohibited.

Taking of grouse, partridge, quail, with trap or snare; or of salmon trout, lake trout, land-locked or fresh water salmon, grayling, bass, pike, pike perch, white perch, pickerel, muscalonge, in any manner other than by ordinary way of angling with single hook and line, with bait, artificial fly or spoon; or of any fish from ponds or streams for breeding purposes, or poisoning the waters thereof, or placing therein without permission of owner or lessee any fish, or the roe, spawn or fry of the same; or of white fish, black bass, land-locked salmon, grayling, pike, perch, or any other variety of fish from any of the waters of the State, and which have been placed or introduced therein by the fish commissioners, for five years after the same have been so placed therein; or of brook or speckled trout less than five inches, and of striped bass less than fifteen inches in length, prohibited. Non-residents are forbidden to take by seine or net any herring, hard-heads or mackerel from the waters of the State for the purpose of selling or barreling the same.

Owners of any lands may be protected by posting written or printed notice: offenders subject to fine of \$1 per bird; fine to be paid to owner of ground.

NEW JERSEY. Hare, rabbit, ruffed grouse, November 1 to December 15; gray squirrel, November 15 to December 15; rail, reed-bird, September 1 to December 15; wood-cock, July 1 to 31, and October 1 to December 15; English snipe, March 1 to April 31, and October 1 to December 15; marsh-hen, September 1 to December 15; deer, October 31 to December 1; wood duck, September 1 to December 31; grass plover, August 1 to December 15; prairie chicken, November 1 to December 31; black bass and Oswego bass May 30 to December 1; brook trout, April 1 to July 15. Possession of game during close season of game restricted to the open season, except quail and pheasants, which may be retained five days after season closes. Transportation of game in close season forbidden, unless killed in another State. In Barnegat bay and its tide-water tributaries north of line from Good Luck Point to Band-house, duck, geese, loosed until October 15 to May 1. Night shooting, sailing for wild fowl, or shooting from boat staked on said water, forbidden. In Mosquito Cove and its inlets ducks and brant can be shot only between sunrise and sundown on Mondays, Wednesdays, and Fridays from September 1 to May 1. Shoulder guns only to be used; trapping deer, hares, rabbits, squirrels, quail, pheasants, wood-cock, rail, reed-bird, prairie chicken, plover or ducks; shooting within quarter of a mile of wild-pigeon nest; catching trout or black bass, except with hook and line; using deleterious substances in fishing, forbidden. Non-residents must obtain a license from the Game Protection Society, if there be one whose jurisdiction covers the county wherein they intend to hunt (except for wild fowl), or to fish for trout, black bass or salmon. Owners of grounds may be protected by posting notices.

NEW MEXICO. Elk, buffalo, deer, antelope, mountain sheep, wild turkey, grouse, quail, September 1 to May 1; trout, May 1 to December 1. Possession of game limited to open season, unless brought from another State. Game may also be killed for subsistence by travelers and others in camp. Trout can be taken only by hook and line. No fish can be taken by poisonous substances. Taking fish from a private lake, pond, or stream used for propagation of fish without the owner's consent, punishable.

NEW YORK. Deer, August 15 to November 1; hares and rabbits, November 1 to February 1; moose, absolutely protected; ducks, geese, brant, September 1 to May 4; squirrels,

August 1 to February 1; quail, November 1 to January 1, and cannot set net, trap, or snare for them; wood-cock, August 1 to January 1, except in Oneida and Delaware counties, September 1 to January 1; ruffed grouse, September 1 to January 1, except in Queens and Suffolk counties, November 1 to January 1; pinnated grouse, September 1 to January 1, netting prohibited; spruce grouse, no close season; wild birds, except birds, absolutely protected, except English sparrow; trout, April 1 to September 1; bass, May 30 to January 1; salt water striped bass, no restriction; muscalonge, May 30 to January 1, except in certain localities it is May 20 to January 1; pickerel, bull heads, no restriction, except Lake George, which is closed between February 15 and July 1; pike, perch, May 30 to January 1; shad, March 15 to June 15. In Hudson River none may be taken above the Northern line of Westchester county, from sunset Saturday, to sunrise Monday. No one person shall take more than three deer during the open season. Hares and rabbits shall not be killed or hunted by ferrets. Shooting on Sunday; fishing within eighty rods of State fisheries and fish ways; drawing off water to catch fish, pollution of water, and stocking the Adirondack waters with any fish except of the salmon, and trout family, prohibited. Game killed in Rockland county cannot be carried out of it. Speckled salmon and California trout caught in Forest Preserve can be taken between May 1 and September 1. Trespassers on private grounds liable for damages, and exemplary damages, not exceeding \$25, nor less than \$15. Owners protected by posting notices.

NORTH CAROLINA. Deer, August 15 to February 15. In Clay, Cherokee, Macon, Jackson, Haywood, Transylvania, Stokes, Forsyth, Surrey, Yadkin, Crayvin, Green and Rockingham counties, partridge, quail, doves, robins, mocking birds, larks, wild turkeys, October 15 to April 1. In Currituck county, partridge and quail, December 1 to April 1; wild fowl, November 10 to March 10. In New Hanover county, partridge, quail, marsh hen, wood-cock, snipe, doves, curlew, October 15 to April 1; trout, in counties West of Blue Ridge, December 30 to October 15. In Clay, Cherokee, Jackson, Swain, Macon, Graham, Transylvania and Henderson counties, game birds are not protected. Shoulder gun only to be used for wild fowl, except in Pamlico, Dare, Carteret, Tyrrell, Currituck, Chowan and Columbus counties. Fire-arms, except bow, bow-gun, or cross-bow, prohibited. Shooting of wild fowl in Currituck and Dare counties, prohibited. Shooting wild fowl from floating battery forbidden in Carteret county. Non-residents shall not use or build blinds, boxes, batteries, or any wood decoys (ducks or geese), or live ducks or geese for decoys in Currituck, Dare or Hyde counties, for killing wild fowl; violations of statute punishable by fine not exceeding \$100, or imprisonment not less than 30 days. Grounds protected by posting notices.

NORTH DAKOTA. Deer, buffalo, elk, antelope, mountain sheep, September 1 to January 1; prairie chickens, grouse, snipe, plover, curlews, August 15 to January 1; bass, muscalonge, pike, pickerel and perch, May 1 to February 1. Killing or having for sale, or for any purpose but consumption within the State, any plover, snipe or curlew forbidden. Fishing, except with hook and line, except in Missouri and Red Rivers, and any inlet or outlet of a lake, forbidden from March 1 to October 1.

OHIO. Muskrat, mink, otter, March 1 to April 15; quail, prairie chicken, November 10 to January 31; wild turkey, October 31 to January 15; ruffed grouse, pheasant, blue winged teal, September 1 to January 1; any wild duck, September 1 to April 10; wood-cock, July 4 to January 1; turtle dove, August 1 to January 1; squirrel, June 1 to January 1; rabbit, October 1 to February 1; deer, October 15 to November 20; brook trout, salmon, land-locked salmon, California trout, March 15 to December 14. Possession of game during close season, prohibited. Insectivorous birds protected. Trapping or snaring of quail or Virginia partridge; killing wild fowl by aid of swivel or punt gun, or any other gun than a common shoulder gun, or by aid of artificial light, or sink-bait, or snare, or taking any fish, except minnows, otherwise than by hook and line from any of the waters of the State, except in private fishing waters, Lake Erie, Mercer and Sinking county reservoirs, or waters of Lake Erie West of Ann Point between June 1 and October 1, and East of Ann Point, between June 10 and October 10; in Mercer county reservoir with trammel or picket net; shooting at wild pigeons within one-half mile of human ground, or taking or destroying their eggs; use of ferret for catching rabbits, prohibited. Whoever discharges any fire-arms on any lawn, park or pleasure ground directly appurtenant to or within gun-shot of any occupied

Except in the counties included in the Forest Preserve (which are Clinton, Franklin, St. Lawrence, Essex, Warren, Herkimer, Hamilton, Lewis, Fulton, Saratoga, Washington, Greene, Delaware, Ulster and Sullivan), who deer is from May 1 to September 15. Cannot be caught except with hook and line, except in Lake Ontario, Niagara River, and wholly private waters. No net, seine, set-line, or set-pole can be used, except in Lakes Ontario and Keuka. Cannot be caught through the ice nor be disturbed in their spawning beds, except in Lake Ontario.

Except in certain localities, where it is from May 20 to January 1; in Schroon, Manopac, Paradox and Skaneateles lakes, July 1 to January 1. And Lake George and Brant lake, August 1 to January 1. Cannot be caught of less than a half pound weight or less than 8 inches long.

Except in Long Island waters, October 1 to May 1, and Chautauqua county, September 1 to February 1. Cannot be killed between sunset and daylight, nor with any net, device, or other instrument than a gun fired from the shoulder, but lantern or other light must be used.

dwelling-house, the property of another, or any charitable institution, shall be fined not more than \$20 nor less than \$5, or imprisonment not more than thirty days, or both.

OREGON. Deer, July 1 to November 1; spotted fawn, absolutely protected. No deer shall be killed except for food. Elk, moose and mountain sheep, August 1 to January 1; killing them for their skins and hams, forbidden; swan and duck, September 1 to April 1; prairie chicken and sage-hen, June 15 to April 1; grouse, pheasant, quail, July 15 to January 1; brook trout, April 1 to November 1. Possession of game limited to open season. Trapping game birds; catching trout, except with hook and line, forbidden.

PENNSYLVANIA. Turkey, October 15 to January 1; duck, September 1 to May 15; plover, July 15 to January 1; wood-cock, July 4 to January 1; quail, November 1 to December 15; ruffed grouse, pinnated grouse, October 1 to January 1; rail, reed-birds, September 1 to December 1; snipe, wild pigeons, any time; elk, deer, October 1 to December 15; squirrels, September 1 to January 1; hare, rabbit, November 1 to January 1; speckled trout, April 15 to July 15; shad and herring, January 1 to June 30; lake trout, January 1 to October 1; pickerel, June 1 to December 1; black and rock bass, pike, May 31 to January 1. Possession of elk, deer, antelope, October 15 to November 30; pinnated or ruffed grouse, quail and wood-cock, 15 days after season closes. Sunday-hunting; hounding deer, killing deer in the water if driven there by dogs; use of ferrets; of guns other than shoulder guns; of traps and traps for game and wild fowl; night-hunting for ruffed and pinnated grouse; use of nets to catch trout, bass or pickerel; shutting off water; use of explosive, etc., substances; taking trout less than five inches long, are forbidden. Non-residents must not trap or net wild pigeons without license of county treasurer.

RHODE ISLAND. Wood-cock, July 1 to January 1; ruffed grouse, robin, lark, woodcock, blue duck, gray duck, September 1 to November 1; rabbits; herring; squirrels, September 1 to January 1; grouse, heath hens, November 1 to January 1; quail, October 15 to January 1; swallow, or box marten, October 1 to May 1; grass plover, August 1 to May 1; dusky, or black duck, summer duck, blue, or green winged teal, September 1 to March 1; wild pigeon (netted or trapped), August 10 to January 1; trout, March 1 to August 15; black bass, June 1 to bird; night-hunting for ruffed and pinnated grouse, from owner of land. Trapping quail and partridges; hunting rabbits with ferrets or weasels; using punt, battery, swivel, or pivot guns for wild fowl; fishing in stream or fresh pond except on one's own land otherwise than with hook and line; catching black bass except with hook and line, forbidden. Trespass punishable.

SOUTH CAROLINA. Deer, August 1 to February 1; wild turkey, partridge, dove, wood-cock, pheasant, October 1 to March 15; fishing in Black River, August 15 to June 1. Fire hunting prohibited. All persons who have not lived a year in the State, forbidden to hunt or fish; but land owners may authorize hunting or fishing on their own land.

SOUTH DAKOTA. Deer, buffalo, elk, antelope, mountain sheep, September 1 to January 1; prairie chickens, grouse, snipe, plover, curlews, August 15 to January 1; bass, muskellunge, pike, pickerel and perch, May 1 to February 1. In Clay, Union and Yankton counties, quail, August 15 to January 1. In Clay, Union, and Lincoln counties, deer, October 1 to January 1. Killing or having for sale, or for any purpose but consumption within the territory, any plover, snipe or curlew forbidden. The same provisions as in North Dakota, with respect to fishing with hook and line.

TENNESSEE. In Henry, Dyer, Giles, Maury, Davidson, Madison, Hamilton, Bedford, and Wilson counties, deer, September 1 to March 1; pheasant, grouse, quail, partridge, wood-cock, lark, and snipe, September 15 to March 1; wild turkey, Sept. 15 to May 1. In Montgomery and Cheatham counties insectivorous birds, partridge, quail, grouse, pheasant, lark, October 15 to March 1; wood-cock, dove, wild turkey, August 1 to March 1; snipe, plover, duck, September 1 to May 1. In Robertson, Davidson, Lincoln, Shelby and Shelby counties, deer, wild turkey, partridge, quail, grouse, pheasant, wood-cock, snipe, lark and insectivorous birds, September 1 to February 1. In Rutherford, Fayette, and Tipton counties, quail and partridge, October 1 to April 1. In Lake county, deer and insectivorous birds, September 1 to February 1; wild-turkey hen, October 1 to March 1; wild turkey, September 1 to May 1; quail, September 1 to April 1. No persons except citizens of certain counties named in statute permitted to hunt game therein for profit. Taking fish otherwise than by hook and line, except in Cumberland, Tennessee, and Big Hatchie Rivers, prohibited. Owners' grounds protected, by posting notices.

TEXAS. Deer, June 1 to December 1; prairie chickens, August 1 to March 1; quail, partridge, September 1 to March 1; wild turkey, September 1 to May 1; fishing at all games with nets, seines, traps, or explosives, prohibited, except in counties especially named in statute. Hunters in Texas should consult statutes with reference to exemptions.

UTAH. Elk, mountain sheep, deer, antelope, September 1 to December 1; beaver and otter, April 1 to November 1; quail, partridge, grouse, August 1 to March 15. Possession limited to open season. Night-hunting for ducks; catching fish by poison or by other means than by hook and line (except in Bear and Utah lakes), prohibited.

VERMONT. Mink, beaver, fisher, otter, November 1 to April 1; wood-cock, August 15 to February 15; quail, wood-duck, partridge, September 1 to February 1; wild geese and ducks,

September 1 to May 1; trout, land-locked salmon, salmon trout, September 1 to May 1; black bass, wall-eyed pike, pike perch, June 15 to September 1; white fish or lake shad, any time from November 1 to 15; taking trout, land-locked salmon, salmon trout, salmon, and pond pickerel, except by hook and hand line, prohibited. Possession of game restricted to open season. Transportation of game for sale out of State forbidden. Insectivorous birds protected. In Lake Champlain and its inlets for ten miles from mouth, fishing with hook and line allowed at any time. Persons engaged in artificial raising of fish may take them in his own waters, when and how he pleases, but must not sell them for food in any State.

Use of explosives or deleterious substances to catch fish; use of nets or traps to catch trout, salmon or bass; taking black bass less than ten inches long, forbidden. Local restrictions affect fishing in Perch, Royal, Tuells, Ludlow, and Plymouth ponds, Rhines cove and Lake Bornoseen.

VIRGINIA. West of Blue Ridge Mountains, pheasants, wild turkeys, September 15 to February 1; partridges, October 15 to February 1; deer, August 1 to January 1; elsewhere in the State, partridges, pheasants, wild turkeys, October 15 to January 1; deer, August 15 to January 1; applying to whole State; wood-cock, July 1 to February 1; robin, November 1 to April 1; wild water fowl, except wood and summer ducks, and sora, September 1 to May 1; marsh hens, killing or taking its eggs later in the season than June 20, prohibited; willet, January 1 to July 20; gull, or stricker, September 1 to January 1; its eggs, from July 1 to June 1; mountain trout, April 1 to December 15; black bass, pond bass, July 1 to May 15. Possession of game during close season prohibited. Insectivorous birds protected. Netting or trapping of pheasants, wild turkeys, partridges, and all wild waterfowl, except wood duck and sora, prohibited; also taking mountain trout otherwise than by hook and line, shooting or spearing black bass or pond bass; any netting and trapping of small birds, except in counties especially exempted by statute. Non-residents are forbidden to fish in Chesapeake Bay. Hunters in Virginia should examine local laws.

WASHINGTON. Deer, elk, moose, August 15 to January 1; mountain sheep, prairie chickens, sage-hens, swans, wild ducks, August 15 to April 15; grouse, pheasant, partridge, August 1 to January 1; brook trout, April 1 to November 1. Possession of game limited to open season. Deer, elk, moose, to be killed except for food. Killing elk, moose or mountain sheep for their skins, hams or outlets forbidden. Hounding deer in Thurston, Cowlitz, Whatcombe Island and Lewis counties; taking mountain brook or bull trout, except with hook and line; duck-shooting between 8 P. M. and 5 A. M.; use of sink-boats, battery, swivel or punt gun forbidden.

WEST VIRGINIA. Deer, September 1 to January 1; quail, October 15 to January 1; wild turkey, ruffed and pinnated grouse, September 1 to February 1; wild ducks, geese and brant, November 1 to April 1; Jack salmon, white salmon, June 15 to May 1; brook trout, land-locked salmon, January 1 to September 1. Possession of game restricted to open season. Insectivorous birds protected. Fish can be caught only by hook and line from March 1 to November 1. Explosive and poisonous substances in fishing; snaring quail; use of any but shoulder gun for wild fowl; shooting within gunshot of occupied house are forbidden. Trespass on inclosed grounds punishable.

WISCONSIN. Deer, October 1 to November 10; otter, mink, marten, fisher, muskrat, November 1 to May 1; wood-cock, July 10 to December 1; quail, partridge, pheasant, prairie chicken, grouse, snipe, plover, wild fowl, September 1 to December 1. Possession of game limited to open season. Killing deer, except for food, and transporting them out of State forbidden. In Green Lake county it is unlawful to use, in wild-fowl shooting, any cover, blind or bough-house over 18 inches high. Trapping or netting deer, game birds or wild fowl; using any but shoulder guns; use of float, sneak-boat, sail or steamboat or floating box or any ambush located in open water beyond the natural cover of reeds, etc., in any lake, river, bay or inlet; hounding deer; catching trout, except with hook and line, forbidden.

WYOMING. Deer, elk, moose, mountain sheep, mountain goat, antelope, buffalo, September 1 to December 1. Killing or capturing same by means of pit, pit-fall or trap prohibited at all times. Ptarmigan, pinnated grouse, sharp-tailed grouse, sage-grouse or any other grouse or sage-hen, August 1 to November 15. Hunting in one day in the State of any of the game birds above mentioned prohibited. Avocet or other wader, or plover, August 15 to April 1; wild duck, trout, goose, August 15 to May 1; fish of all kinds, except trout, July 1 to November 1. All the above animals and birds may be taken at any time for breeding purposes. Possession and transportation of game or game birds is limited to 30 days after season closes. After expiration of 30 days after close of season, possession is prohibited, except game in transit through the territory from other States and Territories. Netting and trapping of game and game birds, use of explosive, poisonous and deleterious substances for the purpose of taking fish, or of weir, dam or other artificial obstruction, or of net, seine or other device, except hook and line, prohibited. Fishing in streams or ponds stocked by fish commission prohibited for three years after publication of notice of stocking same.

HUNTINGBURG, a post-village of Dubois county, Ind., situated in a region where tobacco is

raised extensively, and where block and cannel coal, plumbago, iron ores, potter's clay, mineral paints, lime, and sandstone are obtained. Carriages, wagons, lumber, furniture, and saddlery are here manufactured. Pop. (1890), 3,167.

HUNTINGDON, a post-borough, county-seat of Huntington county, Pa., located on the Juniata River. Lead, coal, iron, fireclay, limestone and timber abound in the region. Brooms, boots and shoes, and furniture are manufactured, and there are planing mills, a brick-yard, and several printing offices in the vicinity. Pop. (1890), 5,729.

HUNTINGTON, a city and county-seat of Huntington county, Ind., built on both sides of Little River. This is the center of a large lime-burning region. There are several factories for working wood into various shapes, a woolen mill and other manufactories. Pop. (1890), 7,328.

HUNTINGTON, a post-village of Suffolk county, N. Y., on the Atlantic Ocean, 38 miles from New York City. Bricks, pottery, and thimbles are made here, and the place is a fashionable summer resort.

HUNTINGTON, a city of Cabell county, W. Va., on the Ohio river. It has several manufactories, a State normal school, and is the seat of Marshall College. Pop. (1890), 10,108.

HUNTINGTON, DANIEL, an American painter, born at New York in 1816. He studied painting under Prof. S. F. B. Morse at the National Academy of Design, and produced the *The Bar Room Politician*, *A Toper Asleep*, and some landscapes, in 1835. In 1839 he went to Italy. There he painted *The Sibyl*, *Early Christian Prisoners*, and other works. After returning to New York he painted many portraits and some historical scenes, such as *Queen Mary Signing the Death Warrant of Lady Jane Grey*.

HUNTINGTON, FREDERICK DAN, born at Hadley, Mass., in 1819. He was at first a Unitarian pastor of a church at Boston. In 1855 he was chosen professor of Christian morals at Harvard College. His theological views then underwent a gradual change, and finally in 1860 he entered the Episcopal church. In 1864 he became rector of Emmanuel church in Boston, and in 1869 he was elected and consecrated bishop of Central New York.

HUNTINGTON, JEDEDIAH, soldier, born in Norwich, Conn., February, 1743; died in New London, Conn., September 25, 1818. He was graduated at Harvard in 1763. Early in 1775 he became captain of a regiment; on April 26th joined the American troops at Cambridge, and later aided in repulsing the British troops at Danbury, Conn. On May 12, 1777, he was made brigadier-general, and joined the American army at Philadelphia. He was one of the officers who tried Gen. Charles Lee for misconduct at Monmouth, and was a member of the court summoned to examine the case of Major Andre at Tappan. Later he was brevetted major-general, became treasurer of Connecticut, and delegate to the convention that adopted the United States constitution. In 1789 he removed to New London, Conn., where he was appointed collector of customs, and he held this office for many years. In May, 1783, he was a member of the committee of four to draft the constitution of the Society of the Cincinnati.

HUNTINGTON, SAMUEL, an American statesman, born at Windham, Conn., in 1732, died at Norwich, Conn., in 1796. He learned the trade of a cooper, but became a lawyer in 1758, when he was made king's attorney and also associate judge of the superior court of Connecticut. In 1776 he was a delegate to the Continental Congress, and as such he signed the Declaration of Independence. From 1779 to 1781 he was president of the Congress, and in 1784 he became chief justice of Connecticut.

In 1785 Huntington was elected lieutenant-governor of Connecticut, and in 1786 he became governor of that State, which office he retained till his death.

HUNTLY, a town of Scotland, county of Aberdeen. In the vicinity is the ruin of Huntly castle, the seat of the earls and marquises of Huntly. Population, 3,519.

HUNTSVILLE, a city and county-seat of Madison county, Ala., called the "Queen City of the Mountains." It has a brass and iron foundry, railroad machine shops, a female seminary (Presbyterian), a female college (Methodist), and a normal school for colored pupils. Pop. (1890), 7,995.

HUNTSVILLE, the county-seat of Randolph county, Mo. It has a college for both sexes, and in the vicinity are flour mills, a woolen mill, machine shops and coal mines. Pop. (1890), 1,826.

HUNTSVILLE, a city and county-seat of Walker county, Tex., 200 miles southeast of Austin. It contains a State penitentiary, Austin College (Presbyterian), Andrew Female Seminary and Sam Houston Normal Institute. It is a cotton-shipping point, and manufactures furniture, cotton and woolen goods, boots, and wagons. Pop. (1890), 1,509.

HURD, JOHN CODMAN, an American author and traveler, born in Boston, in 1816. Between 1840 and 1887, Mr. Hurd made extensive journeys in India, China, Japan and Egypt. He has taken an active interest in the theory of American politics, and has contributed from his pen upon this and kindred subjects several works of recognized value.

HURDY-GURDY, an ancient musical instrument of the stringed kind, something between a guitar and a lute in appearance. It has four or six catgut or wire strings attached to screw-pegs in the head; two of the strings stretch over the sounding-board to the tail-piece, and are sounded by a wooden wheel charged with rosin, which is turned by means of a handle with the player's right hand. The strings are "stopped" by an ingenious arrangement of keys, manipulated with the left hand. The remaining strings are stretched out of reach of the keys, and are tuned as drones. The instrument has a range of two octaves from the tenor G upwards. The rustic simplicity of its music made it at one time a great favorite among the peasantry of a great part of Europe (see Engel's *Musical Instruments*). The name hurdy-gurdy is also sometimes applied to the mechanical pianos familiar on the streets.

HURLBUT, STEPHEN A., born in Charleston, S. C., November 29, 1815; died in Peru, March 27, 1882. He entered the volunteer service early in 1861, and became brigadier-general, was promoted major-general after Shiloh, and succeeded N. P. Banks in command of the department of the gulf. General Hurlbut was minister to the United States of Columbia (1869-72), served in Congress from Illinois (1873-77), and in 1881 was appointed minister to Peru, where he died a year later.

HURON, the county-seat of Beadle county, S. D. On account of its situation and railroad facilities it is a leading commercial center of the State. The region is rich and prosperous. The city has an excellent system of public schools, a complete equipment of water works and electric lights, and many handsome commercial buildings and private residences. Pop. 1890, 3,038.

HURON, LAKE, remarkable for the number and size of its islands, which are mostly Canadian and very rocky, but well timbered. The commerce of the lake is facilitated by a number of good harbors and roadsteads. At Sand Beach, Mich., the United States Government has constructed an artificial harbor of refuge, having a breakwater parallel to

the shore and a pier or mole reaching out from the land at the north side. The principal natural ports on the United States side are those of Hammond's Bay, Michael Bay, Presque Isle, Thunder Bay and Saginaw Bay. Among the towns on the lake are Mackinaw City, Cheboygan, Alpena, Bay City and Port Huron, all in Michigan. On the Canadian shore are Collingwood, Southampton, Kincardine, Port Albert and Goderich. See ST. LAWRENCE, *Britannica*, Vol. XXI, pp. 178, 182.

HURON INDIANS, or **WYANDOTS**. See **INDIANS**, **AMERICAN**, in these Revisions and Additions.

HURST, JOHN FLETCHER, a Methodist Episcopal bishop, born in Dorchester county, near Salem, Md., in 1834. He studied theology at the Universities of Halle and Heidelberg, in Germany. Having returned home in 1858 he was pastor of Methodist churches in Passaic and Elizabeth, N. J., till 1866, after which he took charge of the Methodist missionary institute at Bremen, Germany. Here he remained for three years as teacher and director of the institute. In 1871 he again returned to the United States, became professor of historical theology at the Drew Seminary in Madison, N. J., and in 1873 was made president of that institution. In 1880 he was elected bishop at the General Conference at Cincinnati. He has published a *History of Rationalism; Outlines of Bible History; Martyrs of the Tract Cause; Life and Literature in the Fatherland*, and *Bibliotheca Theologica*.

HUSBAND AND WIFE, LAW RELATING TO. See Vols. XII, p. 400; XV, p. 565. In America a husband has no right to enforce his will against the will of his wife. He is not allowed to restrain her movements and actions by force, or to forcibly compel her to reside with him against her will. The laws recognize the existence of two wills in husband and wife, neither of which can be subordinated to the other and forced into submission by legal compulsion or penalties. Although the old common-law rule, that the services of the wife belong to the husband, remains in force in some of the States, yet it is practically obsolete, because the wife employs her services in his behalf only as she may choose. As the wife has the power to make contracts on her own account, she may also make contracts with her husband, and may in some of the States sue him at law upon such contracts. She may also receive conveyances directly from her husband. But this rule is not without exceptions.

As to the custody of the children in case of disagreement, the mother has acknowledged claims to all female children up to a certain age, the limit of which differs in different States. Infants belong to her by nature. A married woman's right to control her property independently of her husband's influence, to employ her services as she may choose regardless of his wishes, and to have the custody of her children up to a certain age, removes her disabilities so effectually that she is her husband's equal in every point of law, and has in addition a rightful claim to his protection and her support, even if she should not choose to contribute at all to her own personal maintenance.

HUTCHINSON, a city, railroad center and county-seat of Reno county, Kan., situated on the Arkansas River. It has a State reformatory, electric lights, Holly water works, street railroads and a telephone system. It was founded in 1871. Population in 1890, 8,682.

HUTCHINSON, ANNE (1591-1643), an American religious enthusiast, born at Alford, Lincolnshire, England, in 1591. She was the daughter of a clergyman, and married Edward Hutchinson. In 1634 she removed to New England. Anne maintained that those who were in the covenant of

grace were entirely freed from the covenant of works. She gave lectures twice a week, which were well attended. Her adherents were called "Antinomians," and included many prominent men, as Sir Harvey Vane, the governor, and the powerful preacher, Cotton. Boston was soon divided into two hostile theological camps. Mrs. Hutchinson was then tried for heresy and sedition and banished from Massachusetts, along with several of her followers. She then bought for forty fathoms of wampum the island of Aquidneck from the Narragansett Indians, and founded the town of Portsmouth. After the death of her husband, in 1642, she left Rhode Island and settled upon some land to the west of Stamford, Conn., then supposed to be within the territory of the New Netherlands. There, in the following year, she was cruelly murdered by Indians, together with her family, 16 victims in all.

HUXLEY, THOMAS HENRY, an English biologist, born at Ealing, Middlesex, May 4, 1825; commenced his education at the school in that place, and afterwards studied in the Medical School of Charing Cross Hospital. In 1846 he entered the medical service of the royal navy, and in the following year was appointed assistant-surgeon of H. M. S. *Rattlesnake*, which was commissioned for surveying service in Australasia. Huxley devoted himself to the study of the marine animals collected during the service, making them the subjects of scientific papers, which were published by the Royal and Linnean societies. Soon after his return to England in 1850 he was elected a Fellow of the Royal Society, and in 1854 was appointed professor of natural history, including palæontology, in the Royal School of Mines, and held that office, combined with the curatorship of the fossil collections in the museum of practical geology until his retirement from the public service in 1885. After his appointment to the School of Mines his attention was chiefly directed to vertebrate morphology and to palæontology. In 1856 he accompanied Dr. Tyndall on a visit to the glaciers of the Alps, and his name appears as joint-author of *Observations on Glaciers* (1857). In 1859 his large work on *The Oceanic Hydrozoa* was published by the Ray Society. He is author of numerous papers on the invertebrate, vertebrate morphology, palæontology, and of essays on topics of a philosophical and general character. Huxley has greatly interested himself in educational questions, and especially in scientific and medical education, and strongly advocated Darwin's views. He has held the offices of examiner in the University of London, of Fullerian professor at the Royal Institution, of Hunterian professor of comparative anatomy at the Royal College of Surgeons, of president of the Ethnological Society and of the British Association. He has been president and secretary of the Geological Society and of the Royal Society, and is a member of the American and Brussels Academies, a corresponding member of the Institute of France, of the Berlin Academy, and of many other foreign societies.

HYACINTH. See *Britannica*, Vol. XII, pp. 419, 256.

HYACINTHE, PÈRE. See LOYSON, Charles, in these Revisions and Additions.

HYANNIS, a post-village and seaport of Barnstable county, Mass., on the south side of Cape Cod, and on a branch of the Cape Cod (Old Colony) Railroad, 79 miles from Boston. It has a high-school, an iron foundry, a shoe factory and several churches. Its outer harbor is protected by a breakwater, and has a fixed light with an elevation of 70 feet above the level of the sea. Pop. (1890), 1,010.

HYDATID (from Gr. *hydatis*, "a watery vesicle"), a term applied to the bladder-worm stage of

certain tapeworms, particularly to that of *Tania echinococcus*. The term hydatid is sometimes applied in medicine to serous cysts which have nothing at all to do with parasites.

HYDE PARK, an inclosure of nearly 400 acres, which is one of the most popular pleasure parks in London. It adjoins Kensington Gardens. It derives its name from having been the manor of Hyde belonging to the Abbey of Westminster. See *Britannica*, Vol. XIV, p. 824.

HYDE PARK, a village of Norfolk county, Mass., on the Neponset River, and on the Boston, Hartford and Erie and Boston and Providence Railroads, 7 miles from Boston. It has excellent graded schools, a public library and various manufactories. It is chiefly a place of residence for persons who carry on business in Boston. Pop. (1890), 10,193.

HYNDMAN, HENRY MAYERS, socialistic leader, was born in 1842. He was educated at Trinity College, Cambridge, B. A., 1864, and entered the Inner Temple in 1863. He was special correspondent of the "Pall Mall Gazette" during the war between France and Italy in 1866, receiving the special thanks of his paper at the close of hostilities. He is the author of *The Indian Famine and the Crisis in India*, 1877; *England for All*, 1881; *Historic Bases of Socialism in England*, 1883; *The Social Reconstruction of England, Socialism and Slavery, A Summary of the Principles of Slavery, and Will Socialism Benefit the English People?* 1884.

HYDRA, a fabulous monster of the ancient world, said to have inhabited the marshes of Lernæa, in Argolis.

HYDRAULIC ELEVATORS are commonly employed to lift passengers or freight from one story of a building to another, though they may be put to a variety of other uses. The essential principle of an hydraulic elevator is based upon the well-known law that water will always seek its own level. The power is in proportion to the height of the source of supply, and is not dependent, as vulgarly supposed, upon the pressure of said supply. The basic principle of all such machines consists of a water-tight cylinder, in which a piston is propelled either in a perpendicular or a horizontal direction by the pressure of the water exerted upon its base. Various mechanisms are connected with this piston rod and the power exerted utilized for hoisting purposes. The discharge of the water from the cylinder produces the reverse action. Hydraulic elevators have come largely into use with the erection of tall buildings, the roofs of which are conveniently adapted for water storage purposes. The main advantage in hydraulic elevators over those run by steam or other power, is that they can be run independently of break-downs in engines which, before their adoption, were generally used for hoisting.

HYDRAULIC FORGING, shaping wrought iron and steel by the continuous power of the hydraulic press, instead of the repeated blows of a hammer. See HAMMER, *Britannica*, Vol. XI, p. 426.

HYDROCELE (Gr. *hydor*, "water," and *kele*, "a swelling"), a dropsy of the tunica vaginalis, the serous membrane investing the testis. It occurs as a smooth pear-shaped swelling, painless, but sometimes causing uneasiness from its weight. The quantity of fluid in the sac may amount to forty ounces. Hydrocele most commonly comes on without any apparent local cause, and is most frequently met with about or beyond the middle period of life, and generally in persons of feeble power; sometimes, however, it occurs in young children. The treatment may be palliative or curative. The palliative treatment consists in the use of suspensory bandages, and tapping from time to time. The curative treatment consists in set-

ting up inflammation in the tunica vaginalis by the injection of tincture of iodine, so as to obliterate the cavity, or by excision of the whole or part of the sac.

HYDROCOTYLE, a genus of umbelliferous plants, having simple umbels, entire acute petals, and fruit of two flat orbicular carpels, with five thread-like ribs, and no vittæ. The species are numerous, generally more or less aquatic, and widely distributed.

HYDRODYNAMIC ENGINES. See *Britannica*, Vol. XII, pp. 520-21.

HYDROMYS, a genus of water mice found in Australia, Tasmania, and New Guinea, distinguished from all other rodents by the small number (2-2) of molars. They are called beaver rats in Tasmania; are nocturnal and very shy; inhabit the banks of fresh and salt water, and swim well, with the help of partially webbed hind feet. The largest species is twice the size of a common rat.

HYDROPHOBIA and RABIES are fully treated in *Britannica*, Vols. XII, pp. 545-547, XX, 190-202; and the reader is referred to those volumes for exhaustive accounts of the diseases and their effects on man and beast. The researches of M. Louis Pasteur in connection with fermentation, the preservation of wines, and the propagation of zymotic diseases in silk worms and domestic animals, led him to a series of experiments on the result of which he based his announcement to the French academy in 1884, that by inoculation with prepared virus absolute protection against rabies and hydrophobia could be secured. He considers rabies a disease of parasitic origin, although the particular parasite has not yet been securely isolated. His method of treating people bitten by mad dogs is as follows:

He has found that, if he inoculates a number of rabbits from one to another in series with the virus from a mad dog—that is, if he inoculates one rabbit from the dog's virus, a second rabbit from the virus of the first, a third rabbit from the virus of the second, and so on—and then exposes the spinal cords of these rabbits in glass jars which have been free from all moisture by caustic potash, and are kept at a constant temperature of 28° C., these spinal cords lose in virulence with each day of such exposure until, after a period of 14 days, no poisonous effect results from their inoculation into a healthy rabbit or dog. They will produce milder and milder symptoms the longer these spinal cords have been kept as above described, till at last, when they have been kept for 14 days, they will upon inoculation produce no symptoms whatever. Next he has found that, if he daily inoculates the same rabbit with the virus of the modified spinal cords, beginning with the weakest virus and using a stronger one each succeeding day, at the end of the series of inoculations the strongest virus will have no ill effects whatever. The strongest virus is that from the cord of a rabbit just dead of rabies. It will cause rabies in healthy animals in 7 days, if inoculated when fresh.

An animal bitten by a mad dog, if inoculated daily with gradually stronger and stronger virus taken from the spinal cords of rabbits, was, therefore, proof against the outbreak of hydrophobia. Pasteur concluded that a person thus treated must likewise be proof against the disease. On July 7, 1885, when a boy, Joseph Meister, who had been recently bitten by a mad dog, presented himself at his laboratory, he inoculated him first with weak virus. Each succeeding day he inoculated him with a gradually stronger virus, ending this treatment on the 16th of June. The same virus that was used on the boy was tried every time on a

fresh, healthy rabbit, in order to test or "control" the inoculations. It produced rabies in the rabbits, which died in a few days; but it had no effect upon the boy, so that Pasteur considered him proof against hydrophobia from mad dogs. No deleterious effects of these graduated inoculations of the boy have since been reported.

Since that time Pasteur has performed hundreds of similar preventive inoculations. Many cases were sent to him from America, and still more from the various states of Europe. It is generally stated, that of one hundred persons bitten by mad dogs, about 18 to 20 become rabid and die of hydrophobia. By Pasteur's treatment this percentage was reduced to one-half or even less. Some physicians who are opposed to Pasteur, have maintained that there is danger of death being caused by his inoculations without reference to the effect of the dog's bite. An English commission has investigated this point, but could not find a single case of death from this cause alone. A number of wolf-bitten Russians have been sent to Paris to be treated by Pasteur. But it was found that the wolf-virus is much stronger than that of mad dogs; and several of the patients, therefore, died of rabies in spite of Pasteur's treatment. These cases must be considered as exceptional.

During the last few years a large hospital, called the *Pasteur Institute*, has been established in Paris, where dog-bitten patients are treated under Pasteur's personal supervision. In this institute hundred of victims have already been saved from a horrible death. Of the few who have succumbed to the disease it is asserted that there were other complications involved. In London a fund was raised in 1889 to enable indigent English patients to be taken to Paris for treatment at the Pasteur Institute. The efficacy of the Pasteur system, which at first encountered much opposition, is now generally recognized.

HYDROPHYLLACEÆ, a natural order of exogenous plants, containing about 80 known species, natives chiefly of the colder parts of America. The order includes some small trees and bushes as well as herbaceous plants. They are often hispid, like the *Borraginaceæ*.

HYGIERA, or **HYGEIA**: in Greek mythology, the goddess of health. She was worshiped at Athens, Corinth, Argos and other important cities, and in works of art is usually represented as a virgin with a snake, the symbol of health, which drinks from a cup held in her hand.

HYER, GEORGE, an American journalist, born in Covington, Franklin county, N. Y., July 16, 1819. After acquiring merely the elementary rudiments of an education, he was compelled, owing to family necessities, to immediately turn his attention to remunerative employment. He decided to learn the printer's trade, and was apprenticed in the job office of the Ogdensburg "St. Lawrence Gazette." While setting up type, he found leisure to devote himself to the study of surveying. He soon engaged in local work and became recognized as an expert in the field. He made several minor improvements in the theodolite and its accessories. In the year 1836 he accepted a position on the Wisconsin government survey, and removed to the city of Milwaukee in that State. During this period he wrote frequently for "The Advertiser," which was the first of the Milwaukee newspapers issued in the then infant settlement. He was appointed mail agent in 1837, and was the bearer of the first United States mail to the West, an undertaking fraught, in those days, with no inconsiderable danger. In 1838 he ventured into the newspaper business on his own account and was

quite successful, publishing and owning no less than four periodicals, two in Madison, Wis., and two in Milwaukee. He was all this time an active politician, and in 1846 was returned to the legislature, and again in 1850 and 1863. In 1846 he was also a delegate to the State constitutional convention. From 1867, until his decease on April 20, 1872, he was actively engaged in journalism, at the time of his death being connected with the "Times," of Oshkosh.

HYGIENE is the name given to that department of scientific study which deals with the causes and prevention of disease in relation to the preservation of health. It is comparatively a modern science. In this country its study has led to increased sanitary facilities in dwelling houses and an awakened interest in the question of how best to prevent the importation of contagious diseases from abroad. In the matter of public hygiene, however, the large cities are in some respect unreasonably behind the great European capitals, filth of all kinds being frequently permitted to accumulate in the streets and alleys, and remain there during the heat of summer, as a standing menace to the public health. In 1892, however, the outbreak of cholera in Europe in a great measure awakened the municipal authorities of the more populous centers to a sense of their danger. In that year the United States health officers exercised extraordinary quarantine precautions and through their vigilance an outbreak of cholera during the summer was prevented, by the detention and fumigation of all suspected vessels. With an increased knowledge of hygienic laws, the health officers of the larger cities have been better able to cope with outbreaks of disease, and such laws as have been passed for the regulation of the public health have been more rigidly enforced. Undoubtedly the people at large are beginning to be aroused to the necessity of observing the laws relating to hygiene. The householder is no longer willing to leave the sanitary appointments of his residence in the hands of ignorant plumbers, and an unprecedented interest in these matters has undoubtedly been awakened.

HYMNS. For the general history of hymns and hymnody, see *Britannica*, Vol. XII, p. 577. In America comparatively little has been done in this field. Having the literature of England to draw from, there has seemed to be little need. Some of the productions of Bishop Doane, Dr. Mühlenberg, Mr. Thomas Hastings, Mr. Edmund H. Sears, Mrs. S. E. Miles, and Dr. Ray Palmer will, however, compare favorably with those of other countries. Among modern American hymn-writers may be mentioned Bishops Cox and Burgess, and Dr. Crosswell, of the Protestant Episcopal church; Drs. W. Hunter, T. O. Summers, and T. H. Stockton, of the Methodist, and Dr. S. F. Smith, of the Baptist churches; L. W. Bacon, E. Nason, and Professors Mead and Rice, of the Congregationalists; and the Presbyterians have Drs. Robinson, Hatfield, Hitchcock, Schaff and Eddy. The popular *Gospel Hymns* fall under no denominational head. They gave currency to the productions of P. P. Bliss, Fanny Crosby (Mrs. Van Alstyne), and many others. Formerly our collections for public worship were largely composed of British hymns, but of late years hymns born on American soil occupy larger and larger places in the hymnals. More attention is being paid to hymnology, and the improvement in this department of worship is apparent.

HYPERICACEÆ, or **HYPERICINÆ**, a natural order of about three hundred species, trees, shrubs and herbaceous plants, widely distributed and in very different climates, but particularly numerous

in North America. The species of *Vismia* yield a substance resembling gamboge. Many of the *Hypericaceæ* belong to the genus *Hypericum*.

HYPNOTISM (from the Greek *hypnos*, sleep), a condition of mental insensibility to some sense impressions combined with excessive sensibility to other impressions, and total absence of self-consciousness. It is similar to somnambulism, but is artificially induced. In order to hypnotize a person the hypnotizer or "mesmerizer" concentrates the attention of the subject upon some bright object of vision, as a shining piece of glass, or upon the operator's eye, while the operator makes a few gentle strokes over the subject's hair from the top of the head to the front, or makes some passes with his hand before the eyes of the subject. Some mesmerizers merely fix their eyes firmly and steadily upon the subject's eyes, while they hold the subject by the hands. Each hypnotizer has his own particular method of producing the hypnotic state. When a person becomes hypnotic he gradually loses the sense of taste, touch and color. He cannot distinguish between hot and cold, nor between white and black, etc. Next, the forms of objects become indistinct, and can no more be distinguished. Lastly, the eyes become immovable, and nothing is seen even if the eyes are open. But, curious enough, the ear never sleeps. The subject hears and believes everything said by the operator, and finally performs every act the operator commands him to do.

Magnets have often been used as aids in bringing about the hypnotic condition, especially permanent horse-shoe magnets of steel. They were apparently quite efficacious. But a French mesmerizer made lately wooden horse-shoe magnets of the same size and shape as the steel magnets, and painted them exactly like the genuine ones. Upon making his strokes and passes with these pseudo-magnets he was able to produce the hypnotic state in sensitive subjects just as easily as with steel magnets. This proves clearly that magnetism has nothing to do with hypnotism, and that it is merely the belief of the person operated upon, and the submission of a weak will to a powerful will, that brings about the hypnotic effect.

A parallel case taken from the lower animals is reported by Professor J. Czermak, of Leipzig, in the "Popular Science Monthly," of September, 1873, pp. 618-27. He there relates the following incident: Athanasius Kircher, of Fulda, a celebrated savant and Jesuit, tied the feet of a hen together with ribbon, and laid the animal on the ground, where, after many cries and violent struggling, it became quiet. Then Kircher drew on the floor a chalk line diagonally from one eye of the hen to the other, loosened the ribbon; and the hen, although left perfectly free, remained immovable, even when he attempted to rouse her. Kircher attributed this immovability to the force of the hen's imagination.

Professor Czermak repeated the experiment first by tying a hen's legs with a ribbon and making a chalk line on the floor, as Kircher had done. It succeeded. Then he held down a hen's neck and head upon a table, until the frightened bird became quiet, and drew a chalk line on the dark surface of the table, beginning at the end of the hen's beak, and left the hen after this entirely free. Although breathing heavily, she remained motionless on the table, and even allowed herself to be turned over upon her back. Lying on her back she remained quiet until the close of the lecture during which the experiment had been performed.

Afterwards Professor Czermak performed the same experiment with wild hens, geese, ducks, turkeys, and even with a timid, unruly swan; and in

every case he dispensed with the use of a chalk line, and also with the ribbon around the bird's feet. It consisted simply in holding down the neck and head of the bird fast upon the table, until the bird became quiet and convinced that all its struggling to escape was fruitless. The subject must be convinced that it has found its master.

Professor Heidenhain conducted numerous experiments with medical men and students as his subjects. He found that, in the first or last profound stage of hypnotic sleep, the subject on being awakened can remember all that has happened during that sleep. On awakening from the second or more profound stage, the patient can only partially recollect what has happened; while, in the third or most profound stage, all power of subsequent recollection is lost. During the most profound stage he hears sounds and sees sights, etc. (that is, the power of sensory perception remains), without knowing that he hears the sounds and sees the sights, and he can therefore afterwards not recollect the impressions of sounds heard or sights seen. He is like a man whose attention is absorbed or distracted. The less profound stages of hypnotism are paralleled by the condition of *réverie*, in which a passing sight or sound, although not particularly noticed at the time, may be subsequently recalled by an effort of will.

Heidenhain also found that, even when all memory of what has passed during the hypnotic sleep is absent on awakening, it may be aroused by giving the subject a clew—just as in the case of a forgotten dream. This clew may consist of a single word. Again, he found that actions which have been previously rendered mechanical by long habit, as piano-playing, can in the hypnotic state be performed automatically upon the command of the hypnotizer. When Heidenhain held his fist before the subject's face the subject immediately performed a like movement; when he opened his hand, the subject did the same.

Awakening from the hypnotic sleep may be effected by suddenly blowing upon the face of the subject, slapping the hand forcibly, screaming into the ear, or by any sudden change in the stimulation of the subject's nerves. For further information on the subject of hypnotism the reader is referred to **MAGNETISM**, **ANIMAL**, **Britannica**, Vol. XV, pp. 277-83, and **APPARITIONS**, Vol. II, p. 205.

HYODONTIDÆ, a family of fishes represented by the toothed herrings or moon-eyes.

HYOGANOIDÆ, an order of fishes represented by the *Amioidei* and *Lepidostoides*. See **Britannica**, Vol. XII, pp. 687, 688.

HYPNUM, a genus of mosses belonging to the order *Bryineæ*. Archegonia and capsules are borne on special lateral branches. The sexual organs are formed in August and September, and the capsules take from ten months to a year to ripen. Many species are remarkable for their beauty, and are often used for decorative purposes. Their distribution is universal. See **MUSCINEÆ**, **Britannica**, Vol. XVII, pp. 70-73.

HYPOCHERIS, a genus of plants of the natural order *Compositæ*, of which one species, *H. radicata*, is common in meadows and pastures in Britain. Its rough leaves spread on the ground, and resemble in form those of the dandelion; the stem is branched; the flowers are like those of the dandelion, but smaller.

HYPOCYCLOID, a curve whose course is generated by a point in the circumference of a circle rolling on the concave side of a fixed circle.

HYPOPHOSPHITES, potassium, sodium and calcium combined with hypophosphorous acid.

HYPOTATIC UNION, a union of natures or substances so intimate as to constitute one undi-

vided person. The term is used to describe the mysterious union of the divine and human natures in Christ. See MONARCHIANISM, *Britannica*, Vol. XVI, p. 719.

HYPOSTASIS, the Greek term used to designate the distinct subsistence of the three persons of the Trinity.

HYPOSULPHITE, a salt of hyposulphurous acid. See *Britannica*, Vol. XXII, p. 636.

HYPOSULPHUROUS ACID, called also HYDROSULPHUROUS ACID, is obtained by the reduction of sulphurous acid. See *Britannica*, Vol. XXII, p. 636.

HYPOTHECATION, the mortgaging or pledging of property or goods to raise money for some critical emergency.

HYPOTHENUSE, the name of that side in a right-angled triangle which is opposite to the right angle. The well-known property of the hypotenuse, that the square described on it is equal to the sum of the squares described on the other two sides, is proved in the forty-seventh proposition of the first book of Euclid.

HYPOTHESIS, a supposition; a proposition supposed, or taken for granted, in order to draw a con-

clusion or inference for proof of the point in question.

HYPOXANTHINE, called also SARCINE or SARKINE, a white crystalline powder found in the spleen, liver, muscles and other organs of man and in the spleen and blood of the ox.

HYRACEUM, a blackish-brown viscid material, not unlike soft pitch, found in the crevices of the rocks of Table Mountain, Cape of Good Hope. It has an offensive taste, and is not unlike castoreum, for which it has served as a substitute in medicine.

HYRTL, JOSEPH, a distinguished anatomist, was born in 1811 at Eisenstadt, in Hungary; studied at Vienna, and acquired eminence as a scientific anatomist. He became professor of anatomy in Prague in 1837, and at Vienna in 1845. He has contributed not a little to the progress of comparative anatomy, especially that of fishes, and has made the anatomy of the ear a subject of very particular investigation. He has written many books and articles on the subjects above indicated. Hyrtl formed a museum of comparative anatomy at Vienna, and became rector of the university.

I

IABADIUS—IDAHO

IABADIUS, a large fertile island in the East Indies, described by Ptolemy. It was said to be near the Golden Chersonesus, and it produced much gold and grain. It is now thought to be identical with Java, but Humboldt took it to be Sumatra.

IACCHUS (*Gr.* ΙΑΧΧΟΣ), a name for the god Dionysus at Athens and Eleusis. On the sixth day of the Eleusinian Mysteries a decorated statue of Iakchos was carried from Athens to Eleusis, where the votaries were initiated into the last mysteries. Some think that Iacchus is identical with the Roman Bacchus, the son of Zeus and Semele.

IBAGUE, or **IBAQUE**, a town of the United States of Colombia, in the department of Cundinamarca, 70 miles west of Bogota. Population, 6,000.

IBERA, or **YBERA**, a cluster of marshy lakes in the province of Corrientes, Argentine Republic, between the rivers Paraná and Uruguay.

IBERVILLE, **PIERRE LE MOYNE**, **SIEUR**, founder of Louisiana, born at Montreal, Canada, July 16, 1661, died at Havana, Cuba, July 9, 1706. He entered the French navy as midshipman when 14 years old. In 1690 he was one of the leaders in the retaliatory expedition against Schenectady. In October, 1694, he captured Fort Nelson, on Hudson Bay. In 1696 he took nearly all of Newfoundland from the British, whom he defeated in the naval fights of 1697. In March, 1699, he entered the Mississippi River, and ascended it as far as the mouth of the Red River. He then built old Fort Biloxi at the head of Biloxi bay. This was the first post established in Louisiana. After going to France and returning to Louisiana in 1701 he found the settlement reduced by disease, and thereupon transferred it to Mobile, thus beginning the colonization of Alabama. He also occupied Dauphin or Massacre Island. After being made captain of a line-of-battle ship, he captured, in 1706, the island of Novis from the English. He was suddenly struck with a malady of which he died.

IBSEN, **HENRIK**, poet and dramatist, born at Skien in South Norway, March 20, 1828. In 1842 he was apprenticed to a chemist at Grimstad, but abandoned that business to devote himself to literature. His earlier efforts were of little importance. In 1850 he became a student in Christiania University, but did not remain to complete the course. After two years of journalistic work he was appointed director of Ole Bull's theater at Bergen, for which he wrote *The Banquet at Solhaug*, (1856), and *Lady Inger at Østrat* (1857), his first works of note. In 1857 he undertook similar duties for the national theater in Christiania. His next dramas, *The Warriors in Helgoland* (1858), *Love's Comedy* (1862) and *The Rival Kings* (1864), placed him in the first rank of Scandinavian dramatists. He left Norway in 1864, and has lived abroad since that time, chiefly in Rome, Dresden and Munich. The Norwegian Parliament granted him a pension in 1866. In that and the following year appeared the lyric dramas, *Brand* and *Peer Gynt*, in many respects the finest things he has done. Other works are: *The Young Men's League*; *Emperor and Galilean*; *Pillars of Society*; *A Doll's House*; *Ghosts*; *An Enemy of the People*; *The Wild Duck*; *Rosmersholm* and *The Lady from the Sea*. His later plays aroused a storm of controversy in England in 1889, as they

had done shortly before in Germany and in the Scandinavian countries. Up to that time he was practically unknown and unread in the United States, but he suddenly achieved an extraordinary popularity, and his plays were produced and his works perused in many sections of the country. Ibsen has one child, a son named Sigurd, who holds the position of secretary to the Swedish legation in Vienna. Mrs. Ibsen is the step-daughter of the Norwegian poetess, Magdalena Thoreson, who is still living, and one of whose plays, *Indoors*, was recently produced in Copenhagen at the Dagmar theater. An English translation of Ibsen's prose works in 4 vols. was edited by Mr. Archer in 1890. See *Britannica*, Vol. XVII, p. 591.

ICELAND. Our latest information from Iceland is to Feb. 1, 1892. Since 1387 the King of Denmark has been the acknowledged sovereign of Iceland. The island has its own constitution and administration, under a charter dated January 5, 1874, by which the legislative power is vested in the Althing, which is composed of thirty-six members, of whom thirty are elected by the people and six appointed by the crown. The highest local authority is the governor or stiftamtmand. At the head of the administration is a minister appointed by the King of Denmark. This minister resides at Copenhagen and is responsible to the Althing.

ICHTHYODORULITE, the name given to fossil fish spines, not uncommon in stratified rocks.

ICY CAPE, a headland of Alaska, discovered by Cook in 1778. Lat. 70° 21' N.; long. 161° 46' W.

IDAHO SPRINGS, a post-town of Clear Creek county, Col., on the Colorado Central Railroad, 34 miles west of Denver. It is surrounded by beautiful scenery, and is well known for its hot and cold mineral springs, which attract a large number of visitors in summer. Gold and silver are found in the vicinity. Pop. (1890), 1,338.

IDAHO, **STATE OF**. For general article on IDAHO see *Britannica*, Vol. XII, pp. 697, 698. Idaho is an Indian word, meaning "Gem of the Mountains." The first white man known to have set foot upon its territory was Captain Lewis, of Lewis and Clarke's expedition. He crossed the main range of the Rocky Mountains from Horse Plains (Horse Prairie), Beaver Head county, Montana, Aug. 12, 1805. The Missouri Fur Company in 1810 established a trading post on Snake River, but soon abandoned it. Fort Hall was established as a trading post by a party of traders under Nathaniel I. Withe in 1834. Gold in paying quantities was discovered in Idaho in 1860 by Captain James Pierce of Washington Territory, and the first location was on Oro Fino Creek. The first permanent settlement was made at Mount Idaho in May, 1861.

Idaho was created a Territory by act of Congress March 3, 1863, and admitted as a State July 3, 1890. Its territory was originally taken from parts of Dakota, Nebraska, and Washington Territories. Later the Territories of Montana and Wyoming were organized by act of Congress, subtracting from Idaho large portions of its territory and reducing its area to 84,800 square miles, as officially reported in the census of 1890. Idaho extends from the British Possessions on the north to Utah and Nevada on the south, a distance of about 410 miles,

and has a width from east to west of from 44 to 306½ miles.

The population in 1880 was 32,610; in 1890, 84,385, an increase during the decade of 51,775. Its capital and chief city is Boise City.

The following figures give the population of the State by counties, as shown by the census of 1890:

Counties.	1890.	1880.	In-crease.
Ada.....	8,368	4,674	3,694
Alturas.....	2,629	1,693	936
Bear Lake.....	6,957	3,235	2,322
Bingham.....	13,575	3,214	13,575
Boisé.....	3,342	3,214	128
Cassia.....	3,143	1,312	1,831
Custer.....	2,176		2,176
Elmore.....	1,870		1,870
Idaho.....	2,955	2,081	924
Kootenai.....	4,108	518	3,590
Latah.....	9,173		9,173
Lemhi.....	1,915	2,280	
Logan.....	4,169		4,169
Nez Percé.....	2,847	3,965	
Oneida.....	6,819	6,964	
Owyhee.....	2,021	1,426	535
Shoshone.....	5,382	469	4,913
Washington.....	5,836	879	2,957
	84,385	32,610	

Of the rugged mountains of the Bitter Root, Rocky and Wasatch ranges, the Bitter Root occupy the northern, the Rocky the central, and the Wasatch the southern links in the eastern boundary. The "spurs" of these ranges, especially the Wasatch, extend well over into Idaho, and they contain some of the best mineral belts. Their highest peaks reach altitudes varying from 9,000 to 13,000 feet. On the south and southwest are the Owyhee Mountains, which form an important link in the great divide between the waters of the Columbia and those of the Humboldt. The Sawtooth, Salmon River, Wood River and Boise are among the prominent mountain ranges in Central Idaho. On the West are the Blue Mountains of Oregon and Washington. The interior of the State is a vast plateau, varying in altitude from 600 feet above the sea in its lowest valleys to 10,000 on the tops of its highest peaks. The average elevation is from 2,000 to 3,000 feet less than that of Wyoming, Utah, Nevada or Colorado. Its numerous mountain ranges run in a variety of directions, the trend of the principal ones, however, being southeast to northwest. In the interior ranges are the mineral belts, which first attracted general attention to the territory.

The figures showing the principal elevations have been tabulated as follows:

Name.	Elevation.
	<i>Fect.</i>
Albion.....	4,400
Alturas Lake.....	6,600
American Falls.....	4,320
Atlanta.....	5,325
Bear Lake.....	5,900

Idaho has numerous and rapid rivers. With the exception of a comparatively small portion of southeastern Idaho, whose waters flow into the Basin of Great Salt Lake, the river system is entirely tributary to the valley of the great Columbia River. There are three important rivers in Idaho which empty directly into the Columbia—namely, the Spokane, Clark's Fork, and the Snake. Snake River meanders through the eastern, southern and western parts of the State for over 1,000 miles, and, next to Niagara, boasts the most imposing cataract on the continent—the great Shoshone Falls. It rises among the most marvelous scenes of the Yellowstone National Park, within a few feet of the crystal founts from which springs that great tributary of the Mississippi, the Yellowstone, and within sight of the headwaters of that grand inlet of the Gulf of California—the Rio Colorado. Here, at its

romantic start, the Snake is also only a day's ride from its twin torrent of the North, Clark's Fork, but soon sweeps southward 500 miles, as if to gather in the waters of wider and richer fields. Again, flowing majestically northward to mark the boundary between Idaho and Oregon, it unites, when within 400 miles of the Pacific, with the Clark's Fork system to form the Columbia. Soundings of the Snake River in eastern Idaho, near the crossing of the Utah Northern Railway, fail to discover bottom at 240 feet.

Governor Shoupin, in his report for 1889, says that conservative estimates give Idaho 13,000,000 acres of agricultural lands. Others place the amount at 20,000,000. It is safe to estimate it at 15,000,000 to 16,000,000 acres. Industrious pioneers have already brought under cultivation about 4 per cent., or 600,000 acres, expending \$2,000,000 in irrigating canals alone.

The altitude of the land governs, to a large extent, the character of its productions. The valleys of Bear Lake, Lemhi, and Custer counties are profitably cultivated at an elevation of 6,000 feet above tide water, and at 5,000 feet, oats, wheat, potatoes, turnips, etc., are raised abundantly. Timothy and a few hardy grasses flourish at these altitudes. At 4,000 to 4,500 feet all kinds of grain and vegetables are profitable, except a few tender garden products. In some localities fruit is grown successfully at 4,000 to 4,300 feet, and berries are abundant at 4,500. The Boise Valley, so prolific of all kinds of fruit, is 2,800 feet above the ocean, while the valleys of the Clearwater and Snake rivers, near Lewiston in the northwest, with an altitude of but 680 feet, revel in tropical vegetation. Thus Idaho, in addition to its invaluable mineral wealth, possesses a share of the best climatic influences of every portion of the Union.

The soil in the valleys and on the plateaus, in the eastern and southern parts of the State, is composed of vegetable matter mixed with mineral, and, in some localities, with sand and clay. On this class of soil sage-brush grows extensively. In the northwestern counties, dark loam of great depth prevails. In the gulches and near the mountains the soil is mixed with decayed rock. Alkali soil is limited to narrow strips, in widely separated localities, and rarely interferes with agriculture.

The yield of all kinds of cereals, when land is irrigated, is most gratifying, and is not surpassed by any State or Territory. The same can be said of all kinds of vegetables, while in many parts of the State tender vines produce abundantly. Fruits are excellent in quality and flavor. Apples, pears, peaches, plums, prunes, apricots, grapes, and all small fruits and berries are raised in great abundance. Huckleberries, gooseberries, and wild cherries grow wild in profusion on the mountainsides and foot-hills. The camas, which gives a name to several prairies in the State, is found in all sections. It is a bulb which is highly prized by the Indians for food.

Alternating and nestling among the mountain ranges are many valleys, large and small, affording in the aggregate a vast area of agricultural lands not exceeded in fertility by any in the world. The arable portions of the valleys lie from 600 to 6,000 feet above the sea, and they range in size from one to twenty miles in width, and from twenty to one hundred miles in length.

Traversing southern Idaho is the extensive volcanic belt on the basin of Snake River. This basin stretches far into neighboring territories, being 800 miles in length. In Idaho it averages about fifty miles in width. Some of the best valleys traverse it, but it is more noteworthy as the great winter

grazing region of Idaho and adjacent territories. Its nutritious herbs and grasses fatten thousands of cattle and sheep annually.

Idaho is in the same latitude as France, Switzerland, and portions of Italy, Spain and Portugal. It is subject to oceanic influences very similar to those countries, and necessarily has a somewhat similar climate. All this region is near enough to the Pacific Ocean to be very noticeably effected by its currents. By reference to any map whereon these ocean currents are shown, it will be seen that the great Japan current (Kuro Siwa)—that mighty stream of warm water—bears directly against the western shores of America. The temperature of the winds blowing over it is, of course, affected by its heat, and they carry their modifying influences inland hundreds of miles, even extending their genial influences upon the climate of Montana. The average or mean annual temperature at Lewiston—in northern Idaho—is 56°, a milder showing by five degrees than is made by Ohio, milder by ten degrees than Iowa, and milder by twelve degrees than Maine and New Hampshire. Boise City, in western central Idaho, with a much greater altitude than Lewiston, has an average temperature of 51°, the same as Ohio, and four degrees warmer than Connecticut.*

The amount of taxable property in the State, as reported by the county assessors for the past ten years, is as follows:

1883	\$13,938,412 00	1888	\$21,288,392 00
1884	15,497,598 00	1889	23,667,179 47
1885	16,230,530 00	1890	25,581,305 21
1886	17,021,049 00	1891	32,227,509 00
1887	20,741,192 00	1892	31,161,945 00

The outstanding indebtedness of the State on Jan. 1, 1892, was \$137,225.04. The total receipts from all sources, including cash on hand for the fiscal year 1892, were \$424,519.73; the disbursements were \$325,795.58, and the cash on hand, in all the funds on January 1, 1893, was \$98,724.15.

The values of the several metals mined in 1892 were: Gold, \$2,000,000; silver, \$4,500,000; lead, at 4 cents per pound, \$6,490,000; copper, at 10 cents per pound, \$85,600; total, \$13,075,600.

Wool-growing in the State is also largely on the increase. In 1880 there were about 50,000 sheep in Idaho; in 1893 the number was over 350,000. Other industries also show large progress.

Idaho is rich in timber, the most valuable being black, white, and yellow pine, cedar, spruce, birch, and tamarack.

The people of Idaho, being anxious to attain statehood, called a convention, which met at Boise City, July 4, 1889, and framed a State constitution. They claimed to possess the necessary population and other qualifications for admission to the Union, and incorporated in their proposed organic act a special provision against polygamy, this being directed at the Mormons, who have in the last few years settled in the territory. The action of the convention was ratified by the people, and in July, 1890, Idaho was admitted into the sisterhood of States, being the forty-fourth to join the Union.

The following is a list of the Governors, with their dates of service:

Wm. H. Wallace.....	1863-64	John P. Hoyt.....	1875-76
Caleb Lyon.....	1864-66	Mason Brayman.....	1876-80
David W. Ballard.....	1866-67	John N. Irwin.....	1880-84
Isaac L. Gibbs.....	1867-68	Edw. H. Stevenson.....	1884-88
David W. Ballard.....	1868-70	George L. Shoup.....	1888-90
Gilman Marston.....	1870-71	Norman B. Willey.....	1890-93
Thomas W. Bennett.....	1871-73		

The salary of the governor of Idaho is \$3,000.

*For a list of the mineral springs and pleasure resorts of Idaho, see those topics in these Revisions and Additions.

IDDESLEIGH, EARL OF, an English statesman, better known as **SIR STAFFORD NORTHCOTE**, born in Devonshire, Oct. 27, 1818, died in London, Jan. 12, 1887. He was educated at Eton and at Oxford, and began public life in 1843 as private secretary to Mr. Gladstone. In 1847 he was called to the bar, and four years later succeeded his grandfather as eighth baronet. In 1855 he entered Parliament as Conservative member for Dudley, was elected for Stamford in 1858 and in 1866 for North Devon, representing the latter constituency until 1885. He was financial secretary to the treasury in Lord Derby's ministry of 1859, and in 1866 was appointed by the same prime minister president of the board of trade. While at the India office in 1868 Sir Stafford Northcote had charge of the Abyssinian expedition, which under his management was carried to successful issue. In 1871 Mr. Gladstone appointed him British commissioner to the United States for the adjustment of the Alabama difficulty. He was chancellor of the exchequer in 1874, and when Mr. Disraeli went to the Upper House Sir Stafford succeeded to the leadership in the Commons. In 1885 he was raised to the peerage and appointed first lord of the treasury. He was foreign secretary in Lord Salisbury's second ministry, but resigned the post a few days previous to his death.

IDÉ, or ID, a small fresh-water cyprinoid fish, *Leuciscus idus* or *Idus melanotus* of Europe. Its flesh is esteemed. A domesticated variety, colored like the gold-fish, is known in northern Europe as the Orfe.

IDEALISM, the modern philosophical doctrine which maintains that all conceptions proceed from self-consciousness as distinguished from the doctrine that all knowledge begins with sensations. It is the opposite of "realism" and "sensationalism;" for it denies the reality of the outer world and its impressions, and maintains that all our knowledge finds its starting ground in abstract conceptions. The idealist doubts the existence of an external world, and relies solely upon an analysis of self (*Ego*).

SUBJECTIVE IDEALISM makes the innate faculties of the human mind the primary subject of investigation, and predicates a philosophical system from their intuitions and relations.

MODERN IDEALISM started with Descartes (1596-1650), was pushed forward by Baruch Spinoza 1632-1677), and was carried to extreme conclusions by Bishop Berkeley (1684-1753). The latter declared that the supposed existence of a material world was not only incapable of proof, but was also positively false. Idealism was borne to its highest visions and most perfect realizations in Germany. The most noted philosophers of this school are G. W. Leibnitz (1646-1716), Immanuel Kant (1724-1804), Fichte (1762-1814), F. W. J. Schelling (1775-1854), and G. W. F. Hegel (1770-1831). Kant, however, insisted that the material of our thoughts is in the external world.

IDELER, CHRISTIAN LUDWIG, astronomer and chronologist, born near Perleberg, in Prussia, Sept. 21, 1766, died Aug. 10, 1846. After holding various offices he received a professorship at the University of Berlin in 1821. He was author of several valuable works, which include *Historische Untersuchungen über die astronomischen Beobachtungen der Alten* (Leipzig, 1806), and *Handbuch der mathematischen und technischen Chronologie* (Berlin, 1825-26).

IDIOCY. See **INSANITY**, in these Revisions and Additions; also **Britannica**, Vol. XIII, pp. 95-113.

IDIOSYNCRASY, a peculiarity of physical or mental constitution or temperament. See **ANTI-PATHY**, in these Revisions and Additions.

IDUN, or IDUNA, the name of a goddess of Norse mythology. She was the daughter of the dwarf

Svald, but, being received among the Æsir, she became the wife of Bragi.

IGNATIEFF, NICHOLAS PAVLOVITCH, a Russian general and diplomatist, was born in 1832. He is the son of Count Paul Ignatieff, a captain of infantry, who, at the time of the military insurrection that occurred at St. Petersburg, in consequence of the somewhat forcible accession of the Grand-Duke Nicholas to the throne of Russia in 1825, was the first to pass over, with his company, to the side of the new czar—a defection which it was his duty to make in this manner in opposing the defection of the rebels, and which insured the triumph of the former, and gained for Captain Ignatieff and his family the powerful protection of Nicholas I. The subject of this notice had, at the very outset of his career, the Emperor Alexander II. for his godfather. He was educated at home and in the Corps des Pages, and, according to custom, quitted that select establishment for young aristocrats to enter the guard; and in the Military Academy, after three years' study, he was appointed as staff officer. At the beginning of the Crimean war he was ordered to be at the staff of General Berg. He occupied at Riga the post of quartermaster general of the Baltic Corps. He then passed from the military to the diplomatic service, finding his point of transition in the military attachéship to the embassy at London. His chief performance in this capacity was a report on England's military position in India, which so pleased the emperor that he summoned Captain Ignatieff to Warsaw for a personal interview. In 1858 Ignatieff, now a colonel and aid-de-camp to the emperor, was sent on a special mission to Khiva and Bokhara. He was afterwards made a major general in the imperial suite, and sent as plenipotentiary to Peking, 1860, where he concluded a treaty by which the Province of Ussuri was ceded by China to Russia. On his return to Russia he was made director of the Asiatic department in the ministry of foreign affairs. In 1864 he was appointed minister at Constantinople, where his legation was afterwards, 1867, raised to the rank of an embassy. Apart from his rank as ambassador, he was a lieutenant general, and general aid-de-camp to the emperor. The object which General Ignatieff steadily pursued at Constantinople was to secure for Russia a powerful influence over Turkey. He completely reassured the late Sultan Abdul Aziz as to the intentions of the government of St. Petersburg, while on the other hand he gained the good-will of the Christian subjects of the porte by his courteous behavior and his simulated anxiety to protect them. In the negotiations between the various European powers prior and subsequent to the war between Russia and Turkey, General Ignatieff took a very prominent part. He was recalled from the embassy at Constantinople May 2, 1878, when Prince Labanoff was sent there in his place. Afterwards he was appointed minister of the interior, from which post he was dismissed in June, 1882, on account of his Pan Slavist intrigues, and for shutting his eyes to the persecution of the Jews. He remained, however, a member of the Council of the Empire. He is a bitter enemy of the Nihilists.

IGNORAMUS (*Lat.*, we do not know), the word formerly written by a grand jury on the back of an indictment, meaning that they rejected it. The word is now used most commonly as a synonym for a blockhead.

ILION, a thriving village of Herkimer county, N. Y., on the Mohawk River. Here is located a factory where firearms, type-writers and sewing-machines are made. The celebrated Colts revolver is made here. Pop. (1890), 4,057.

ILLINOIS INDUSTRIAL UNIVERSITY (since July 1, 1885, UNIVERSITY OF ILLINOIS), at Urbana, capital of Champaign county, was established under acts of Congress of July, 1862, and July, 1866, and under acts of the legislature of Illinois Jan. 25, Feb. 28, and March 8, 1867, to "teach in the most thorough manner such branches of learning as are related to agriculture and the mechanic arts, including military tactics, and not excluding other scientific or literary studies." The University was opened in 1868, and three years later women were admitted as students. It includes the following colleges and schools: College of agriculture and horticulture; college of civil, mechanical and mining engineering, and architecture; college of natural sciences, chemistry, and natural history; college of literature and art; school of military science; and school of industrial art. The assets of the University are about \$1,000,000, with an income of about \$25,000.

ILLINOIS RIVER, the largest stream in Illinois, formed by the Des Plaines and Kankakee Rivers, which unite in Grundy county, and flow southwest, entering the Mississippi a few miles above Alton. The main stream is about 350 miles in length, and is navigable in favorable seasons as far as Peru, a distance of 250 miles. It is connected by canal with the lake navigation at Chicago.

ILLINOIS, STATE OF. For early history, government, productions and earlier statistics of Illinois, see Britannica, Vol. XII, pp. 703-06. The census of 1890 reports the area as 56,650 square miles. Population, 3,826,351; capital, Springfield, with a population of 24,842.

The cities having a population of 9,000 and over were: Alton, 10,184; Aurora, 19,634; Belleville, 15,360; Bloomington, 22,242; Cairo, 10,044; Chicago, 1,098,576; Danville, 11,528; Decatur, 16,841; East St. Louis, 15,156; Elgin, 17,429; Freeport, 10,159; Galesburg, 15,212; Jacksonville, 12,357; Joliet, 27,407; Moline, 11,995; Peoria, 40,758; Quincy, 31,478; Rockford, 23,589; Rock Island, 13,596; Springfield, 24,852; La Salle, 9,004; Ottawa City, 9,971. The city of Chicago, which ranked in respect of population as the fifth city in 1870 and the fourth city in 1880, is now the second city in the United States. The State reported a population by decades as follows: in 1810, 12,282; in 1820, 55,162; in 1830, 157,455; in 1840, 476,183; in 1850, 664,470; in 1860, 1,711,951; in 1870, 2,539,891; in 1880, 3,077,193; in 1890, 3,826,351.

The complete list of governors of the State, with their dates of official service, is as follows:

TERRITORIAL.

Ninian Edwards 1809-1818.

STATE.

Shadrack Bond	1818-20	Richard Yates	1861-65
Edward Coles	1822-26	Richard J. Oglesby	1865-69
Ninian Edwards	1826-30	John M. Palmer	1869-73
John Reynolds	1830-34	Richard J. Oglesby	1873--
Joseph Duncan	1834-38	John L. Beridge	1873-77
Thomas Carlin	1838-42	Shelby M. Cullom	1877-83
Thomas Ford	1842-46	John M. Hamilton	1883-85
Augustus C. French	1846-53	Richard J. Oglesby	1885-88
Joel A. Mattison	1853-57	Joseph W. Fifer	1888-93
William H. Bissell	1857-60	John P. Altgeld	1893--

Illinois was the second State in rank in the United States in the production of steel in 1880 and in 1890, Pennsylvania being the first. In Illinois the increase during the decade was 241 per cent. The production in 1880 was 254,569 tons; in 1890 it was 868,250 tons.

The number of pupils enrolled in the public schools of the State in 1890 was 778,319, a gain of

10.55 per cent. in ten years. In addition to those in the public schools there were 105,232 pupils in private and parochial schools. In the latter there were reported about 47,000 Catholic, 24,000 Lutheran, 4,000 German Evangelical pupils and small numbers of Protestant Episcopal, Holland Christian Reformed, Dutch Reformed and German Presbyterian children.

The State reform school is located at Pontiac, and reported, in 1890, 383 inmates.

The coal products of the State in 1890 were 12,104,272 tons, valued at \$11,755,203, and were nearly double the products of the year 1880. The coal area of the State embraces about 37,000 square miles. The employes during 1890 numbered 24,823; the wages aggregated \$8,694,347, and the grand total of expenditures in the coal business in that year amounted to \$10,366,069. The coal is bituminous and is found in 19 counties; it is used for steam and heating purposes. Coke is manufactured in Gallatin and La Salle counties.

In the value of the output of sandstone the State ranked twelfth in 1880 and twenty-fifth in 1891—the State of Ohio in both cases ranking the highest of all the States.

Illinois is a small producer of petroleum, the output being 1,400 barrels in 1889, all of it ranking as lubricating oil.

The following statistical statement conveys some idea of the progress of the State of Illinois in later years:

The finances of the State are in an exceedingly flourishing condition. In 1853 the State debt was \$17,398,985. This was much reduced in subsequent years, and during Governor Cullom's administration it was finally extinguished. From that time (1881) to the present (1893) the State has been free from public debt. The revenues of the State from all sources, from Oct. 1, 1890, to Sept. 30, 1892, were: general revenue fund, \$5,854,269.26; State school fund, \$2,091,058.17; local bond fund, \$2,641,415.85, a total revenue of \$10,586,743.28 for the period named. Expenditures during the same period were: general revenue fund, \$5,856,678.82; State school fund, \$2,126,967.90; delinquent land tax fund, \$331.06; unknown and minor heirs' fund, \$2,348.40; local bond funds, \$2,696,333.71, giving total disbursements of \$10,682,659.89. At the close of 1892, the balance of all funds in the State treasury amounted to \$4,349,551.38.

There were only four public institutions prior to 1856, viz: a penitentiary at Alton; a deaf and dumb asylum; a central hospital for the insane, and an institution for the education of the blind, the three latter being located at Jacksonville. There have been erected since that time thirteen additional institutions, viz: Three universities; an additional penitentiary, at Chester; a reformatory, at Pontiac; three insane asylums; a soldiers' orphans' home, at Bloomington; a soldiers' and sailors' home, at Quincy; an institution for the feeble-minded, at Lincoln, and an asylum for insane criminals, at Chester.

Several extremely momentous questions confronted the people of the State during the years 1892 and 1893. Foremost among these may be mentioned what were popularly known as the compulsory educational and the convict labor questions. A growing dissatisfaction with the workings of the Edwards compulsory education law first found expression in the insistance of the German Lutherans, a large and influential body, of a right to establish and maintain schools of a denominational character. Just prior to the State elections, a political coalition was formed between the Lutherans and the Catholics, and the State, which for

years had returned a republican majority, went overwhelmingly democratic. The repeal of the Edwards law followed and the problem now confronting the Legislature is the enactment of such a law as shall provide educational facilities for the youth of the State and be acceptable to all parties and denominations. The constitutional amendment, passed in 1886, forbidding convict contract labor, which had been ignored by the former administration, was another of the issues upon which the democrats were returned to power. It has been decided to cancel all existing contracts as illegal. On the first day of December, 1892, there were confined in the Joliet penitentiary 1,434 convicts; in the Chester penitentiary 613 convicts, and the reform school had 339 on that date. The question recurs: How can these prisoners be employed at remunerative labor without that labor coming into competition with the free labor of the State. To the solution of this question legislative efforts will be addressed.

Urgent necessity has been felt for the passage of some law restricting the amount of daily labor which may be exacted of women and children, and governing the construction and inspection of the buildings wherein they are employed. For this purpose, a board was created and commissioned by the State to investigate the so-called "sweating system," which had assumed conspicuous proportions in the cloak and clothing trade of Chicago. The facts in regard to the character, the extent, and the effects of this method of employing men and women, have been obtained by a thorough canvass of the districts where it prevails, and they will afford an intelligent basis for any legislative action which the circumstances may demand.

The character of what was once fondly termed "the Prairie State" has been gradually changing. From a comparatively sparse and thinly-populated territory, Illinois has developed into one of the best cultivated States in the Union. Well-tilled and prosperous farms have replaced the wide reaches of open country which in former years gained the State its title. Populous cities have sprung up and teeming millions contribute to her material prosperity. What the future destiny of this great commonwealth will be, when, with the completion of the drainage and ship canal, she will have gained connection with the Gulf, it is impossible to conjecture. That it will usher in a period of even increased prosperity, there is little room for doubt.

ILMENIUM, a name given by R. Hermann to an element which he supposed to be present in ore found in the Ilmen mountains in Siberia; he also supposed it to be present in some other minerals. His conclusions have not been admitted by other chemists.

ILMINSTER, an ancient market-town of Somersetshire, England, on the river Isle, eleven miles southeast of Taunton. The church in Ilminster is a noble example of perpendicular architecture. Some manufactures of ropes, bricks and tiles are carried on. Population of parish (1881), 3,281.

ILSLEY, EAST, or MARKET ILSLEY, a market-town of Berkshire, England, situated amid bleak downs, nine miles north of Newbury and six and a half miles south of Didcot. Its sheep markets are among the most important in the kingdom. Population, 577. Archbishop de Dominis (see Britannica, Vol. VII, p. 355) was rector of West Ilsley, two miles northwest. Population, 377.

IMITATION: in the science of musical composition, the repeating of the same passage, or the following of a passage with a similar one, in one or more of the other parts or voices, and it may be

either strict or free. When the imitated passage is repeated note for note, and every interval is the same, it is called strict, and it may take place in the unison or octave, or in any other of the degrees of the scale, either above or below the original passage. Canon (see Britannica, Vol. XVII, p. 82) is strict imitation carried on to some length. The progression of a passage may also be imitated by an inversion, or by reversing the movement of the original, also by notes of a greater or of a lesser value.

IMMIGRATION INTO THE UNITED STATES OF AMERICA. For general article on this subject see EMIGRATION, Britannica, Vol. VIII, pp. 173-177; and UNITED STATES, Vol. XXIII, pp. 781, 783-821. The official returns made to the commissioners of immigration at the office of the superintendent up to June, 1891, furnish the data for the following figures:

The nationality of immigrants to the United States for the year ending June 30, 1890, was as follows: Germans, 92,427; English, 57,020; Irish, 53,024; Italians, 52,003; Swedes, 29,632; Scotch, 12,041; Norwegians, 11,370; Danes, 9,366; Swiss, 6,993; French, 6,585; Europe, not specified, 112,764; total—Europe, 443,225; all others, 12,077. Of the whole number of immigrants who arrived within the above-named period, 364,086 came through the customs district of New York, 27,178 through Baltimore, 29,813 through Boston, 22,658 through Philadelphia, and 11,567 through all others.

The reported occupations of immigrants who arrived during the year ending June 30, 1889, were as follows: Laborers, 110,809; farmers, 28,962; servants, 30,220; carpenters, 4,373; miners, 5,505; clerks, 4,005; tailors, 3,809; shoemakers, 2,065; blacksmiths, 2,185. The total number of professional immigrants was 2,815; of skilled laborers, 50,457; of miscellaneous, 182,394.

The following are the yearly official summaries since and including 1820:

Year.	Total Immigrants.	Year.	Total Immigrants.
1820.....	8,385	1858.....	119,501
1821.....	9,127	1859.....	118,616

1857.....	246,945		

In the above table immigrants from the British North American Possessions and Mexico are not included since July 1, 1885.

With regard to insane persons, the new immigration law says that "all idiots, insane persons, paupers, or persons likely to become a public charge, shall be excluded from admission into the United States." This provision is a reenactment of the law of Aug. 3, 1882, which provided that "no convict, lunatic, idiot, nor any person unable to take care of himself or herself, without becoming a public charge, shall be permitted to land."

Now, there is ample proof that since 1882 hundreds of persons have gained admission who ought to have been excluded according to the last-mentioned act. They were shipped to this country from Europe by the authorities of cities and towns, or by so-called benevolent societies. By the same agencies convicts have also been sent to us. A convicted murderer, Nicholas Bader, arrived at the port of New York on April 23, 1891, having been shipped to America by the authorities of a town in Germany, where he had been confined in prison for one year and in an asylum for the insane for 24 years. This case is now under the consideration of the Treasury Department. In a similar way European city and town authorities have for years unloaded paupers and lunatics upon the taxpayers of this country, and especially upon those of the State of New York. In Austria, many persons convicted of crime have been given the alternative of either going to prison or emigrating to America.

Since 1884 the Board of Charities of the State of New York has sent back to Europe more than 600 lunatics, imbeciles, and feeble-minded persons who had been shipped to America by the authorities of their native cities or towns, by immigration societies, and "benevolent" organizations, often also by relatives, guardians, and friends. Two-thirds of these persons entered the State by way of the port of New York. They were afterwards found in the asylums, hospitals, and almshouses of the State. In many cases they had come with through tickets to interior towns, where they at once became public charges. In many instances the senders of such persons even selected the asylum or almshouse in this State to which they should be consigned. Of the 600 persons sent back to their homes in Europe there was no complaint made in any single instance by the authorities into whose charge they fell after their return home. This shows that the action of the Board of Charities had been proper and justified.

According to official statements the number of insane persons in the institutions of the State of New York were on Oct. 1, 1880, 9,537, and on Oct. 1, 1890, 16,022. This is an increase of 6,485 persons in 10 years, or 68 per cent. In the same 10 years the increase of the population of the State was only 18 per cent. It is therefore the belief of the Board of Charities—that this belief is based upon close inquiries—that by far the greater part of this increase is due to the shipment of insane persons to this State from the countries of Europe.

No attempt to enforce the law of 1882 on the Canadian boundary has been made, nor was it effectively enforced at the seaports. But there is a commendable energy shown to enforce the new law at the seaports, and especially at the port of New York, where the evasion of the former law has imposed so heavy a burden on the taxpayers and Board of Charities. In view of the bearing the new Congressional act has upon the general question of immigration, as well as in view of the relief which it promises to bring to the country from the perils incident to indiscriminate and unrestricted immigration, we make room for full text of the act which is as follows:

AN ACT in amendment to the various acts relative to immigration and the importation of aliens under contract or agreement to perform labor.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress Assembled, That the following classes of aliens shall be excluded from admission into the United States, in accordance with the existing acts regulating immigration, other than those concerning Chinese laborers: All idiots, insane persons, paupers or persons likely to become a public charge, persons suffering from a loathsome or a dangerous contagious disease, persons who have been convicted of a felony or other infamous crime or misdemeanor involving moral turpitude, polygamists, and every person whose ticket or passagage paid for with the money of another or who is assisted by others to come, unless it is affirmatively and satisfactorily shown on special inquiry that such person does not belong to one of the foregoing excluded classes, or to the class of contract laborers excluded by the act of February twenty-sixth, eighteen hundred and eighty-five; but this section shall not be held to exclude persons living in the United States from sending for a relative or friend who is not of the excluded classes under such regulations as the Secretary of the Treasury may prescribe: *Provided,* That nothing in this act shall be construed to apply to or exclude persons convicted of a political offense, notwithstanding said political offense may be designated as a "felony or other infamous crime or misdemeanor involving moral turpitude" by the laws of the land where he came or by the court convicting.

SEC. 2. That no suit or proceeding for violation of said act of February twenty-sixth, eighteen hundred and eighty-five, prohibiting the importation and migration of foreigners under contract or agreement to perform labor, shall be settled, compromised, or discontinued without the consent of the court entered of record with reasons therefor.

SEC. 3. That it shall be deemed a violation of said act of February twenty-sixth, eighteen hundred and eighty-five, to assist or encourage the importation or immigration of any alien by promise of employment through advertisements printed and published in any foreign country; and any alien coming to this country in consequence of such an advertisement shall be treated as coming under a contract as contemplated by such act; and the penalties by said act imposed shall be applicable in such a case: *Provided,* This section shall not apply to States and immigration bureaus of States advertising the inducements they offer for immigration to such States.

SEC. 4. That no steamship or transportation company or owners of vessels shall directly, or through agents, either by writing, printing, or oral representations solicit, invite or encourage the immigration of any alien into the United States except by ordinary commercial letters, circulars, advertisements, or oral representations, stating the sailings of their vessels and the terms and facilities of transportation therein; and for a violation of this provision any such steamship or transportation company, and any such owners of vessels, and the agents by them employed, shall be subjected to the penalties imposed by the third section of said act of February twenty-sixth, eighteen hundred and eighty-five, for violations of the provision of the first section of said act.

SEC. 5. That section five of said act of February twenty-sixth, eighteen hundred and eighty-five, shall be, and hereby is, amended by adding to the second proviso in said section the words "nor to ministers of any religious denomination, nor persons belonging to any recognized profession; nor professors for colleges and seminaries," and by excluding from the second proviso of said section the words "or any relative or personal friend."

SEC. 6. That any person who shall bring into or land in the United States by vessel or otherwise, or who shall aid to bring into or land in the United States by vessel or otherwise, any alien not lawfully entitled to enter the United States, shall be deemed guilty of a misdemeanor, and shall, on conviction, be punished by a fine not exceeding one thousand dollars, or by imprisonment for a term not exceeding one year, or by both such fine and imprisonment.

SEC. 7. That the office of superintendent of immigration is hereby created and established, and the President, by and with the advice and consent of the Senate, is authorized and directed to appoint such officer, whose salary shall be four thousand dollars per annum, payable monthly. The superintendent of immigration shall be an officer in the Treasury Department, under the control and supervision of the Secretary of the Treasury, to whom he shall make annual reports in writing of the transactions of his office, together with such special reports, in writing, as the Secretary of the Treasury shall require. The Secretary shall provide the superintendent with a suitable furnished office in the city of Washington, and with such books of record and facilities for the discharge of the duties of his office as may be necessary. He shall have a chief clerk, at a salary of two thousand dollars per annum, and two first-class clerks.

SEC. 8. That upon the arrival by water at any place within the United States of any alien immigrants it shall be the duty of the commanding officer and the agents of the steam or sailing vessel by which they came to report the name, nationality, last residence, and destination of every such alien, before any of them are landed, to the proper inspection officers who shall thereupon go or send competent assistants on board such vessels and there inspect all such aliens, or the inspection officers may order a temporary removal of

NOTES ON THE CHART BY REV. A. W. HEWES.—Periodicity.—The culminating years of the past decade are 1882 and 1888, as indicated in the diagram by the general trend of the charting lines.

The chief causes producing fluctuations in the stream of immigration are undoubtedly the comparative conditions affecting labor in this country and that from which the immigrant comes, and it is remarkable that a knowledge of favorable or unfavorable conditions becomes so quickly and generally known in the laboring communities of the Old World, from which the mass of immigration flows.

Look at the chart and see how true it is that the principal European countries reduced their exodus very greatly in 1888. The two exceptions are Italy and Hungary, and in the following year Hungary and Russia. What else than the letters to friends in the old country can give the impulse that increases or decreases this living tide? How these chart lines portray the judgment of foreign peoples as passed upon labor conditions here!

At the same time these chart lines serve to compare the various labor conditions of Europe. Since 1883 the Russian line shows a constant increase, indicating that, whatever the contemplating immigrants from other countries may have believed to be to their advantage or disadvantage, those in Russia have seen advantage only, and have continued to come in undiminished numbers to a country which they believed would give them better conditions. The year 1890 furnishes two other examples of the same kind; for while most countries decreased their contribution to our population, Italy and Hungary greatly increased theirs.

Increase.—It needs but a brief study of the chart lines to see that the three countries which are at present most persistent in their increase are the three just noted: viz., Italy, Russia and Hungary. They send clerks, miners, carpenters and joiners, and tailors.

Of the unskilled or "miscellaneous" occupations 38 are reported, ranging from three "bird dealers" to 139,365 laborers. Others reporting at over 2,000 each are: 3,437 peddlers, 6,707 merchants, 484 teachers, 23,625 servants (of which number Ireland sends 10,118), and 23,296 farmers (of which number Germany sends 8,469).

Among the more numerous "professional occupations" are reported 491 clergymen, 578 musicians, 261 physicians and surgeons, 484 teachers, 109 sculptors, 158 lawyers, 105 engravers, 271 artists, 169 actors, and (the least number) 5 linguists.

One of the surprises coming to many who examine the chart will be the discovery that England alone (not even including Wales) has, since 1885, sent a larger number of immigrants than Ireland.

A few points showing what occupations these two nationalities bring with them are given:

Country.	Total Skilled.	Carpenters and Joiners.	Clerks.	Engineers.	Masons.	Mechanics and Artisans.	Miners.
England.....	10,189	598	1,142	509	621	964	1,143
Ireland.....	2,524	179	428	45	153	300	192

Country.	Total Professional.	Teachers.	Physicians.	Clergymen.
England.	958	152	83	160
Ireland..	184	32	22	78

Country.	Total Miscellaneous (unskilled).	Farmers.	Laborers.	Merchants, Dealers.	Servants.
England.....	15,719	2,452	10,563	1,207	3,042
Ireland.....	30,436	1,525	18,194	229	10,118

Chinese.—The act excluding them became effective August 6, 1882. Between June 30, 1882 (the beginning of the fiscal year 1883), and August 6, 6,613 of the 8,031 landed on our shores. Since 1883 their record ranges from 10 in 1887, to 279 in 1884, but in 1890 jumps to 1,716, of which 1,221 reported as merchants. Italian line has almost met the Irish line. The Russian above both the Norwegian and Scotch.

Germans.—As stated in the title of the chart, the German line is not shown, because it would require such a great increase in height of the diagram. The German average for the decade has been (in round numbers) 145,000 (double that of either English or Irish), while in 1882 the number was 250,630, and in 1886 it was 84,403. Like the records of other desirable immigrants, that of the Germans has since 1883 shown a decrease, the figures beginning with 1888 being 103,717, 92,533 and 92,427.

Italians.—The total Italian immigration for the five years 1876-80 was 23,270; for the five years 1881-85 it was 109,320; and for the five years 1886-90 it was 196,549. These figures refer to the continental immigration alone which the chart line portrays. The insular (Sicily and Sardinia) for the three periods named was 420, 184, and 1,256 or 1,869, for the whole fifteen years, of which 1,146 came in the three years 1888-90. (If this insular immigration were added to the continental it would not move the chart line a hair's breadth except in 1888-90, and in those years its movement would be almost imperceptible.)

Hungarians.—Previous to 1880 less than 1,000 per year.

Swedes.—Previous to 1879 about 5,000 annually.

Occupations.—Of the total immigration of 1890 (455,302), 194,658 had no occupation, 44,540 were skilled operators, 211,756 unskilled or "miscellaneous," 3,236 were reported as having "professional occupations," and 1,117 as "occupation not stated."

The Official Report specifies 102 skilled industries. The number belonging to each of these industries ranges from 3 "iron puddlers" to 3,879 "tailors." The eight reporting over 2,000 each are, in numerical order.

IMMIGRATION STATISTICS. The total arrival of immigrants in the United States from foreign countries, other than British North America and Mexico, during the year ending June 30, 1891, amounted to 560,319, against 455,302 during the preceding fiscal year, an increase of 105,017. The following table shows the number and nationalities of immigrants arrived in the United States during the years ending June 30, 1890 and 1891:

Country of Last Permanent Residence or Citizenship.	1890	1891	Increase.	Decrease.
England.....	57,020	53,600		3,420
Ireland.....	53,024	55,706	2,682	
Scotland.....	12,041	12,357	516	
Great Britain, other...	669	448		221
Total Great Britain and Ireland.....	122,754	122,311		443
Germany.....	92,427	113,554	21,127	
Italy.....	62,003	76,055	14,052	
Russia and Poland.....	46,671	74,923	28,252	
Austria-Hungary.....	56,199	71,042	14,843	
Sweden and Norway.....	41,002	49,448	8,446	
Other Europe.....	82,169	36,652		45,517
China.....	1,716	2,836	1,120	
All other countries.....	10,361	13,498		6,773
Total.....	455,302	560,319	105,017	

Including tourists and immigrants there was an increase in arrivals of 94,376, or more than 22 per cent. over the previous year. The arrivals during the first four months of the present fiscal year (ending Oct. 31, 1891) have been 189,778, an excess of 40,595, or of more than 27 per cent. over the corresponding months of 1890. This extraordinary and progressing increase in the tide of alien immigration to the United States, which does not include the increased arrivals via Canada, has not failed to attract the attention of the whole country, and it will doubtless command the early consideration of Congress.

IMPROVISATORS, poets who, without previous preparation, compose on a given theme, and who sometimes sing and accompany the voice with a musical instrument. The talent of improvisation is found in races in which the imagination is more than usually alert, as among the ancient Greeks, the Arabs and in many tribes of negroes. Down to the present day the performances of improvisators constitute a favorite entertainment of the Italians. Women have frequently exhibited this talent in a high degree.

IMPUTATION, a common technical expression in Christian theology. It denotes the transference of guilt or of merit, of punishment or reward. The doctrine of the imputation of sin, for example, is that all mankind are sharers in the fact and consequences of Adam's fall from innocence, and the correlative doctrine of the imputation of Christ's righteousness is that the merit or righteousness of Christ is transferred to those who believe in Him; in other words, that they become sharers in His righteousness.

IN ARTICULO MORTIS (at the moment of death), a legal phrase used in connection with the execution of deeds by persons at the point of death.

INCARNATION, a term used in theology to denote the union of the Divine nature of the Son of God with human nature in the person of Christ. See **JESUS CHRIST** in these Revisions and Additions; also *Britannica*, Vol. VIII, pp. 656-672.

INCLINED PLANE, *THE*, is reckoned one of the mechanical powers because a man may, by rolling it up a plane, raise a weight, which he could not lift. The figure ABD represents an inclined plane, AD is the plane properly so called; DB the height of the plane, BA its base, and BAD the angle of inclination or elevation. The power necessary to sustain any weight on an inclined plane is to the weight as the height of the plane to its length; or as DB to DA. Hence a force which would, if applied

vertically, just lift 300 pounds will keep a rolling mass of 780 pounds in position upon a smooth inclined plane, whose *gradient* is five (height) in thirteen (sloping length); and a force exceeding this would pull the mass up the slope. In every practical case, however, there is a certain force expended in overcoming friction, even on a dead level; in railway trains this is equivalent to vertically lifting about 50 pounds for every ton of dead weight; and when a train leaves a level run to go up a slope of, say, one in eighty, the engine has for every ton of weight to do work equivalent to vertically lifting fifty pounds plus one-eightieth of a ton, or seventy-eight pounds instead of the former fifty.

IN CŒNA DOMINI, a celebrated papal bull, which dates back to the Middle Ages.

INCORRIGIBLES, that class of persons who, notwithstanding correction, persist in the commission of crimes against society of greater or less magnitude. The term is also applied to common rogues and vagabonds and to refractory inmates of penal institutions. Special laws have been passed in several states of the Union denominated habitual criminal acts, under which lengthy terms of punishment are meted out to old-time offenders. The effectiveness of these laws has been greatly enhanced by the Bertillon system of identification.

INCOME TAX, a tax levied in some countries on income. During and following the civil war, the United States Government levied (from 1861 to 1872) a tax on incomes at the following rates: Dating in 1862, incomes under \$5,000 a year the tax was 5 per cent. (exempting \$600 and paid house-rent); on incomes of \$5,000 and not over \$10,000, 7½ per cent. and on those over \$10,000, 10 per cent. without exemptions. There were several modifications: in 1865 the exemption limit was fixed at \$1,000, and in 1870 at \$2,000. In 1872 the income tax in the United States was abolished. In the United Kingdom the

rate of income tax in 1890 and 1891 was rated as follows:

	In the £
Schedule A, lands, tenements, etc.....	0 0 6
Schedule B, occupiers of farms, etc.....	0 0 8
" Scotland and Ireland.....	0 0 2½
" Nurseries and market gardens.....	0 0 6
Schedules C, D, and E, income.....	0 0 6
If under £150, exempt; if under £400, the tax is not chargeable upon the first £120.	

INCUMBENT, the rector, parson, or vicar holding an ecclesiastical benefice.

INDEBTEDNESS OF FOREIGN NATIONS.

The figures and facts here given (and designed to present a comparative view of the indebtedness of nations in 1890), have been compiled from the detailed statements and reports furnished by the proper financial officers of the United States, as collated and published in the census bulletins of 1890. No special report from Spain and Mexico, and from some of the Southern States had been received up to the date of sending these pages to press. In some cases where an increase of the indebtedness of a nation is shown, such increase is due to aid given to private corporations, or the direct expenditures in the constructions of railways or other public improvements, the value of which improvements may be equal to that of the expenditures therefor, or perhaps in excess, but of which no account can well be taken in a summary of this character. (See table on following page.)

To show changes in the debt in any country between the two periods in question it has been found necessary to adopt a like standard of value for each period, and for that purpose a nominal value in gold of the currency in which the debt was stated, has been used whenever known. Owing to the delay in making up the accounts some of the debts reported for 1890 were, in fact, for 1889, and in a few cases for 1888; but in every case the latest date for which a report of the debt has been received has been taken. See **UNITED STATES, DEBT OF**, in these Revisions and Additions.

INDENTURE, the technical name for a deed, under seal, entered into between two or more parties with mutual covenants. The edges were formerly indented, or notched, to correspond, for identification and security. *Indentures of apprenticeship* refer to the contract between an apprentice and a master.

INDEPENDENCE, a city and county-seat of Buchanan county, Iowa, on Wapsipinicon River, 65 miles west of Dubuque. It has a State insane asylum, three parks, expensive school-buildings. Population in 1890, 4,120.

INDEPENDENCE, the county-seat of Montgomery county, Kan., located on the Verdigris River, 134 miles, by rail, south of Lawrence. Pop. 3,127.

INDEPENDENCE, a city and county-seat of Jackson county, Mo., 10 miles east of Kansas City, and three miles from the Mississippi. It contains two colleges and several other institutions of learning. It was formerly the headquarters of the overland routes to New Mexico, Oregon and California. Population in 1890, 6,373.

INDIA. For general article on this great British empire, giving *in extenso* its geography, history, government, productions, commerce and earlier statistics, see *Britannica*, Vol. XII, pp. 731-812. The present area of the empire, without reckoning in Baluchistan (130,000 square miles), which is to some extent dependent on, or feudatory to, India, reaches from the 8th to the 35th degree of north latitude, and from the 67th to the 100th degree of longitude east of Greenwich; Calcutta itself lying in 88° E. longitude. The areas of Cashmere, Manipur, and of the recently annexed province of Up-

per Burma, with its dependent Shan States, have never been surveyed. Cashmere, however, is estimated at 80,900 square miles, Manipur at 8,000, Upper Burma at 90,000, and the British Shan States at 90,000. With these estimated figures, the total area of British India may be taken to be 1,648,944 square miles, of which 765,947 square miles are under native and the remainder under British administration. The population of India, shown by the census in 1881, was 253,982,595; but this did not include the figures for Cashmere, which in 1873 had a population of 1,534,972, or Manipur with its population of 221,070, or Upper Burma with its estimated population of 3,000,000, and the Shan states with their estimated population of 2,000,000. Adding in these totals, and allowing for a yearly increment of one-half per cent. to the census figures, the total population of British and feudatory India at the beginning of the year 1891 may be taken to be 273,533,000, of whom 211,936,000 are in British territory. From Peshawar, the northern frontier station, to Cape Comorin, the distance is 1,900 miles, and the same distance separates Kurrachee, the port of Sind, from Sudiya, the frontier post on the eastern border of Assam. The limit, yet undefined, of the states dependent on Upper Burma stretches even further to the east than Sadiya, while British influence in Baluchistan goes farther west than Peshawar. The province of Burma, including the country formerly independent, and now called Upper Burma, which was annexed to the Asiatic dominion early in 1886, lies to the east of the Bay of Bengal, and forms no part of the Indian Peninsula.

The English dominion in India dates from 1600, when the first East India Company was incorporated by Queen Elizabeth. The act establishing the authority of the British crown, and the "Proclamation to Princes, Chiefs, and Peoples of India," that Her Majesty, Queen Victoria, assumed the government of all the territories of India, were dated Nov. 1855. It was not, however, till 1877 that the queen formally assumed the title of Empress of India. The home imperial government is intrusted to a "Secretary of State for India," assisted by a council of not less than ten members, the majority of whom must be persons who have served or resided ten years in India, and who have not left India more than ten years previous to the date of their appointment on the council. The office is held for a term of ten years, and any vacancy is filled by the appointment of the "Secretary of State for India."

British India now (1891) embraces nine separate provinces, each under its own civil government, but subordinate to the general and supreme government. The resident chief executive, the viceroyal governor-general, whose administration extends over all the provinces, is appointed by the crown. His present annual salary is £25,000 (\$125,000), with additional allowance of about £12,000. His ordinary term of office is five years. The present incumbent (July 1, 1891) is the Marquis of Lansdowne, who assumed office Dec. 10, 1888. He is supreme in his executive authority, but is assisted by an executive council of six members, including the commander-in-chief. Power is reserved to him of overruling his council; but all acts of the government run in the name of the "Governor-General in Council." This body, forming the supreme government in India, passes in review the entire administration in six separate departments—Finance and Commerce, Foreign, Military, Public Works, Home, and the Department of Revenue and Agriculture. Each department is under the charge of a secretary, and is also the

special care of a member of the supreme council, who has authority to deal with affairs of routine and minor importance, and to select what is worthy of the consideration of the governor-general and his collective council. The governor-general specially superintends the political business of the foreign office. The department of finance and commerce looks to questions of finance, to stamps, excise; the postoffice, and anything involving a permanent charge on the state; also to questions bearing on the commerce of the country. The most important subjects coming under the attention of the department of revenue and agriculture are the land revenue, forests, and the agricultural development of the country. The home department deals with the educational, medical, sanitary, ecclesiastical, judicial, municipalities, local government boards, police, and other matters, and has charge of the penal settlements of Port Blair and Nicobar. The foreign department conducts relations with Afghanistan, Nepal, and other conterminous countries, and corresponds with the political agents of the numerous semi-independent native states of Rajputana and Central India, and with the residents of Mysore, Cashmere, Baroda, and Hyderabad. The marine service, as well as the army, is under the military department. The legal member takes charge of government bills in the legislative council, which consists of twelve members (besides the seven members of the executive council), of whom one-half must be unconnected with the public service. As only Bengal, Madras, Bombay, and the Northwest Provinces possess councils of their own, the legislative council of India legislates for those provinces which are unprovided with local councils, or on matters of exceptional importance affecting the empire.

Separate high courts have been established for the provinces of Madras and Bombay and for the lieutenant-governorship of Bengal (with jurisdiction also over Assam), and of the Northwest Provinces. The Punjab has a chief court; the Central Provinces, Oudh and Mysore, have each a judicial commissioner, and Burma has a judicial commissioner and a recorder.

The government of India is debited with the cost of the army for all India, with the interest on debt, and, generally, with all imperial as distinguished from provincial expenditure.

Since the close of the record in the Britannica, Vol. XII, the list of governor-generals has been as follows, with date of appointment: Marquis of Ripon, 1880; Marquis of Duferin and Ava, 1884; Marquis of Lansdowne, 1888.

The native states of India cover an area of 766,000 square miles, and contain an estimated population of 61,000,000. The most important of native Princes in 1891 are mentioned in the following table:

Princes.	Sq. M.	Pop. 1881.	Revenue.
			Rx.*
Nizam of Hyderabad.....	81,807	9,845,594	3,130,000

* Chief city of Oude.

The present Nizam of Hyderabad was installed in 1884. Cashmere was granted to Gholab Sing by Lord Hardinge, after the First Punjab War. His son and successor, Rumbir Sing, died on September 12, 1885, and was succeeded by the present Maharaja, Pertab Sing, when also a British Resident was appointed, and stronger pressure was brought to bear in favor of much needed reforms in the government. In 1889, in consequence of continued misgovernment, the Maharaja was deprived of his powers, which were intrusted to a native council, assisted by the advice of the resident.

The most important recent act of the Indian legislation was a comprehensive act, passed in 1890, dealing with railways in that empire. Other acts dealt with probate and administration in India, with the law relating to guardians and wards, with Indian cantonments, with the forests of Burma, and with tenant right, land revenue, sanitation, and local self-government in the Central Provinces. Legislation was also passed to make penal the disclosure of official secrets, to prevent cruelty to animals, to raise the duty on imported spirits and to tax Indian-brewed beer, and, lastly, to indemnify certain witnesses who had incriminated themselves, on the promise of indemnity, at the trial of a high government official in Bombay.

In the year 1889-1890, the foreign trade of India increased beyond the totals of the previous year. During that year, excluding government merchan-

dise and treasure valued at Rs. 2,76,55,061, the foreign seaborne trade of British India (excluding Aden and its dependencies, of which the trade may be stated at about 7½ million tens of rupees) amounted to Rs. 1,89,25,82,000, or 5½ per cent. above the total of 1888-89; of this amount Rs. 84,01,94,000 represent imports and the remainder exports. The imports of treasure increased to Rs. 17,46 lacs, and the exports to 1,90½ lacs.

All imports are free, excepting arms and ammunition, opium, liquors, petroleum oil, and salt. An excise tax on Indian-brewed beer is under consideration. The duty on petroleum oil of 6 pies per imperial gallon was introduced in 1888, and in 1889-90 realized nearly 16¼ lacs. Notwithstanding the duty there has continued to be a large increase in the imports of oil, especially from Russia. The value of Indian cotton yarn and piece goods exported has increased from 74 lacs in 1876 to 674½ in 1889-90. Each year sees a large extension of this industry. Having wrested the markets of China and Japan to a large extent from England, the Bombay mill-owners are now successfully competing for the market of Eastern Africa, of Aden, of Ceylon, and of the Straits Settlements.

The following table gives the populations, with the religious census of the principal cities of India as reported in the census of 1881:

Census 1881.	Hindus.	Mahomedans.	Christians.	Others.	Total.

INDIAN AFFAIRS IN THE UNITED STATES. For the general article on the American Indians, including the history and earlier statistics of the various tribes, brought down to a recent date, see Britannica, Vol. XII, pp. 822-835. In these Revi-

sions and Additions it is only required that such facts and figures shall be given as are needed to furnish the latest important information. This information has been drawn chiefly from the elaborate annual report of the Hon. T. J. Morgan, Commissioner of Indian Affairs, made to the United States Secretary of the Interior, under date of October, 1890, and from the Official Census Reports of the United States for the year 1890.

I. SUPERVISION OF INDIAN AFFAIRS.—The law prescribes that the Commissioner "shall, under the direction of the Secretary of the Interior, and agreeably to such regulations as the President may prescribe, have the management of all Indian affairs, and of all matters arising out of Indian relations." He is charged with the annual disbursement of more than \$7,000,000 and with the purchase and distribution of great quantities of subsistence, clothing, agricultural, medical, and other supplies. He gives instructions to more than sixty agents, supervises their work, examines their accounts, decides perplexing questions arising constantly in the course of administration of agency affairs, and through them oversees in detail the various lines of civilization inaugurated among the tribes, farming, stock-raising, building of houses, Indian police and courts, social and sanitary regulations, etc. He determines upon the appointment and removal of over twenty-five hundred agency and school employes, and appoints traders and physicians. Licensed trade among Indians is under his exclusive control.

He considers and determines all questions of law arising in reference to Indian lands; the legal status of Indians with reference to each other and to white people; the conflicts between local or State laws and tribal customs, and between State and Federal laws; also questions of citizenship, guardianship, crimes, misdemeanors; the prosecution of persons for the sale of whisky to Indians; taxation; water rights; right of way of railroads; cattle grazing; conveyances of land; contracts between Indians and whites; sales of timber on Indian reservations; allotment of land, etc. Many of these questions, especially those relating to lands, are of great intricacy, involving interpretations of treaties and laws as far back as colonial times.

He is charged with the duty of organizing a plan of education with all which that implies; the erecting of schoolhouses; appointing of teachers, and the keeping of a watchful oversight over all Indian school matters.

Bills relating to Indian affairs are usually referred by Congress to the Indian Bureau for information and report, and before signing an act the President generally refers it to the Commissioner for report as to the existence of any reason why it should not receive Executive approval. Original bills and reports are also prepared by the Indian Office for transmission to Congress.

Under the act of March 3, 1885, the Commissioner examines and reports to the Secretary of the Interior on all depredation claims, amounting to many millions of dollars, which have been filed in the Bureau during the last forty years.

II. AREA AND POPULATION OF INDIAN TERRITORY BY STATES.—At the date of the Commissioner's annual report in 1889 there were 133 Indian reservations in the United States (counting the 22 small reserves of the Mission Indians of California as one only, and the 19 Pueblo reserves in New Mexico also as one), having an aggregate area of about 116,000,000 acres, or 181,250 square miles, an area greater than that of the New England and Middle States combined, greater than the aggregate area of

the States of Ohio, Indiana, Illinois, and Kentucky, and nearly equal to the combined area of the two Dakotas and Montana. It is larger by half than the United Kingdom of Great Britain and Ireland, larger than Sweden or Norway, and nearly as large as either France or Spain. The total Indian population of the United States, *exclusive of Alaska*, was, by the census of 1889, 250,483, and *exclusive of the five civilized tribes in Indian Territory*, 185,283.

The following table shows the distribution of Indian lands and Indian population in the several States and Territories at the date above referred to:

State or Territory.	Area in acres.	Square miles.	Population.
Arizona.....	6,603,191	10,317½	17,779
California.....	494,045	772	12,739

Wyoming.....	2,942,400	3,660	1,945
Miscellaneous.....			1,302

III. AREA, POPULATION, AND DISBURSEMENTS BY AGENCIES.—The table on page 893 gives the names and State locations of the various Indian Agencies, severally showing the areas and Indian population with the government appropriation to each, with salaries of the agents and the amount of the bonds which the latter were required to execute severally for the fiscal year ending June 30, 1890.

IV. SETTLED GOVERNMENT POLICY.—On this important question the Indian Commissioner says: "It has become the settled policy of the government to break up reservations, destroy tribal relations, settle Indians upon their own homesteads, incorporate them into the national life, and deal with them not as nations or tribes or bands, but as individual citizens. The American Indian is to become the Indian American."

"A public school system is being rapidly provided, whereby every accessible Indian boy and girl of school age is to be afforded an opportunity of acquiring the rudiments of an English education and the elements of an honorable calling. What progress has been made in this direction during the last year is discussed under the general topic of education."

"The Indians themselves are coming to understand the present policy of the Government and are showing an increasing readiness and even desire to adjust themselves to it. During the year I have had personal interviews with prominent chiefs and representative Indians from Wisconsin, North and South Dakota, Oregon, Arizona, New Mexico, Oklahoma, and Indian Territory, and I have been much gratified with their intelligent apprehension of the situation and with the willingness exhibited, as a general thing, to except lands in severalty with individual citizenship. Almost without exception they have pleaded with me for more and better schools."

Agency.	Area in Square Mls.	Population.	Bond.	Amount of Annual Disbursements.	Salary.

*Agent at Green Bay is required to file a special bond in the sum of \$100,000 to cover logging money.

†At present in charge of Army officer.

"Another fact of significance is the growing recognition on the part of Western people that the Indians of their respective States and Territories are to remain permanently and become absorbed into the population as citizens. While demanding the application of the principle of 'home rule' in the selection of agents and other employees from the State or Territory in which the Indians are located, I think they also recognize the obligations which they thereby assume to recommend only suitable persons for appointment. If the Indians of South Dakota, for instance, are to remain forever within the limits of the State, either as a burden and a menace, or as an intelligent, self-supporting, co-operative factor in State life, no others except the Indians themselves can have so deep an interest in their practical status as to the people by whom they are surrounded.

"There is also a growing popular recognition of the fact that it is the duty of the Government, and of the several states where they are located, to make ample provision for the secular and industrial education of the rising generation, leaving the churches free to prosecute with renewed vigor their legitimate work of establishing and maintaining religious missions. By this harmonious and yet separate activity of the Government and the churches all of the Indians will eventually be brought into right relations with their white neighbors, and be prepared for the privileges and responsibilities of American Christian citizenship."

V. INDIAN TRAINING SCHOOLS. — The United States Indian Department has given much attention to the subject of Indian education and the schools have been visited and inspected with increased care and thoroughness. Large and care-

ful expenditures have been made in repairing and enlarging school-houses and providing them with proper equipments, and new ones have been erected where most urgently demanded. A new and carefully revised system of rules, including a course of study, has been drawn up and a series of textbooks prepared.

Commissioner Morgan in his supplemental report of 1889 set forth quite in detail his views regarding Indian education. These views have met with most gratifying acceptance, and have awakened a great deal of interest among all classes of citizens. The plan there outlined received the indorsement of Dr. W. T. Harris, United States Commissioner of Education, of General John Eaton, ex-Commissioner of Education, and was heartily approved by the National Educational Association, the American Institute of Instruction, the New York State Teachers' Association, and other leading educational bodies, besides receiving the warmest commendation of distinguished educators and philanthropic organizations, like the Mohonk Conference, the Indian Rights Association, etc.

Under the fostering care of the Government, a series of training schools has grown up more or less distant from the reservations where, in addition to the ordinary English education, Indian pupils are trained to habits of industry. The following table shows the list of these schools with their locations, date of opening, capacity, rate per annum, enrollment, and average attendance during the fiscal year ending June 30, 1890.

Location.	Date of Opening.	Capacity.	Rate Per Annum.	Enrollment.	Average Attendance.
Carlisle, Penn.	1879	500	167	789	702
Salem, Ore.	1880	250	175	208	175
Genoa, Neb.	1884	255	175	106	154
Grassell Institute, Kansas	1884	440	175	460	417
Grand Junction, Idaho.	1884	200	175	194	169
Albuquerque, N. M.	1886	60	175	48	38
Albuquerque, N. M.	1886	225	175	222	164
Carson, Neb.	New.	150			
Santa Fe, N. M.	New.	135			
Pierre, S. D.	New.	90			
Fort McDowell, Ariz.	New.	200			
Fort Totten, N. D.	New.	250			

For the fiscal year ending June 30, 1891, Congress made liberal appropriations for these schools which

will enable the office to put them on a broad basis, and thoroughly equip them for their important work. With the improvements now being made they will be able next year to care for not less than thirty-five hundred students.

Already a very considerable number have shown both the desire and ability to pursue higher studies. Several are now successfully teaching, or fitting themselves to teach, others are practicing medicine, some are preaching, and still others are preparing for the practice of law. The desire for these higher studies is steadily increasing and only needs a little fostering to be productive of the best results. A common school, industrial education for all, a liberal and professional education for the worthy few, with a fair field and free competition, is all that is asked for Indians as for others.

The outing system which brings Indian youth into intimate and vital relationship with civilized communities is now readily developing and is productive of the most hopeful results. During the year 1890, Carlisle accommodated nearly 800 pupils, more than half of whom have had the advantage of living and working with Pennsylvania farmers and others. Their work was very satisfactory, and the school was unable to meet the demand made upon it for help. When the present plans for increasing its capacity are completed, not less than 1,000 pupils can be cared for at this one institution. Every Indian boy or girl who secures a place to work at fair wages has become a producer, and is practicably independent and self-supporting.

The superintendent of Haskell Institute wrote to the Commissioner that he expected to be able, when the present plans for that school are completed, to care for 1,000 students, and to provide homes for a large number of them among Kansas farmers.

VI. INDIAN BOARDING AND DAY SCHOOLS.—The subjoined table shows the number of Indian boarding and day schools and average attendance for each year from 1882 to 1890, both inclusive:

Year.	Board'g sch.		Day schools.		Totals.	
	No.	Average attendance.	No.	Average attendance.	No.	Average attendance.
1882.....	71	2,755	54	1,311	125	4,062
1883.....	75	2,599	64	1,443	139	4,046
1884.....	86	4,358	76	1,757	162	6,115
1885.....	114	6,201	86	1,942	200	8,143
1886.....	115	7,260	99	2,370	214	9,630
1887.....	117	8,020	110	2,540	227	10,560
1888.....	126	8,705	107	2,715	233	11,420
1889.....	136	9,146	103	2,406	239	11,552
1890.....	140	9,865	106	2,367	246	12,232

Concerning the question of the education of Indian pupils in the public school wherever practicable, the Commissioner says: "Believing that the true purpose of the Government in its dealings with the Indians is to develop them into self-supporting, self-reliant, intelligent, and patriotic citizens, and believing that the public schools are the most effective means of Americanizing our foreign population, I am desirous of bringing the Indian school system into relation with that of the public schools. Not only so, but wherever possible I am placing Indian pupils in the public schools. Very few are thus far enjoying these advantages, but in a letter addressed to the superintendents of public instruction in the several States and Territories where there are Indians under the care of the

National Government I have invited their co-operation, and have offered to contract with school districts for the tuition of Indian pupils at the rate of \$10 per quarter.

"I think this will prove a very important feature of the work in hand, and confidently expect within a year to be able to report a great advance in this direction. Indian allottees can be provided with educational facilities for their children in no more satisfactory manner, and the tuition paid by the Government aids the school districts to maintain schools in sections of the country where lands in severalty have been taken by the Indians."

The total annual appropriations made by Congress since the year 1876 for the support of Indian schools were as follows:

Year.	Appropriation.	Per cent of increase.
1877.	\$ 20,000	
1878.	30,000	50
1879.	60,000	100
1880.	75,000	25
1881.	75,000	
1882.	135,000	80
1883.	487,200	260
1884.	675,200	38
1885.	992,800	47
1886.	1,100,065	10
1887.	1,211,415	10
1888.	1,179,916	96.6
1889.	1,248,015	14
1890.	1,364,568	01
1891.	1,842,770	35

VII. MEDICAL AND SURGICAL SERVICE.—With the exception of five civilized tribes, all the Indians under governmental control are dependent upon the agency physicians for their services. Their own "medicine men" are ignorant, and often vicious, and their historic superstitious influence over the tribes is comparatively slight. The physicians employed at the agencies are, however, poorly paid as is shown by the following table of physicians' salaries copied from the Commissioner's report for 1890:

No.	Official Designation.	Salary.
1	Agency physician.....	\$1,300
38	do.....	1,200
25	do.....	1,000
2	do.....	900
1	do.....	700
2	do.....	300
2	do.....	200
71	Average salary.....	1,062

No.	Official Designation.	Salary.
4	Physician at Schools.....	\$1,300
2	do.....	1,000
1	do.....	900
2	do.....	500
1	do.....	300
1	do.....	240
11	Average salary.....	813
	Average salary for the entire list.....	1,028
	Total cost for salaries.....	84,300

VIII. APPROPRIATIONS TO RELIGIOUS DENOMINATIONS FOR INDIAN SCHOOL WORK.—The subjoined

table shows the amount set apart by the Government for the various religious denominations for Indian education for each of the fiscal years from and including the year 1886:

	1886.	1887.	1888.	1889.	1890.	1891.
Denominations.						
Roman Catholic.....	\$118,344	\$194,635	\$221,169	\$247,672	\$356,987	\$247,689

Appropriation for Hampton.....	20,040	20,040	20,040	20,040	20,040	20,040
Total.....	228,269	382,214	376,264	529,905	561,960	554,558

IX. TITLES TO INDIAN LANDS.—The civilized nations of Europe, who had acquired territory on the American continent, asserted in themselves, and recognized in others, the exclusive right of the discoverer to appropriate the lands occupied by the Indians. By the treaty of 1783 the United States acquired all the rights to the soil which had previously been in Great Britain; and by its treaty of 1803 with France, in its purchase of Louisiana, it agreed to execute and respect all treaties made and agreed upon between Spain and the several tribes of Indians resident within the country ceded. In the case of Johnson & Graham, lessee, v. William McIntosh, Chief-Justice Marshall said in effect (8 Wheaton's Reports, p. 543) that there was no doubt that either the United States or the several States had a clear title to all the lands within the boundary lines described in the treaty with Great Britain, or within the limits of the Louisiana purchase, subject only to the Indian right of occupancy, and that the exclusive power to extinguish that right, was vested in that government which might constitutionally exercise it.

It was further settled in the case of the Cherokee Nation *v.* The State of Georgia (5 Peters, p. 1) that the Indians had an unquestionable and therefore an unquestioned right to the lands they occupied until that right of occupancy was extinguished by voluntary cession to the Government; that they occupied lands to which the United States asserted a title, independent of their will, which must take effect in respect of possession when their right of occupancy ceased. Hence, the claim of the Government to the lands of the Indian tribes extends to the complete ultimate title, charged with the Indian right of possession and to the exclusive power of acquiring that right. (See *Johnson v. McIntosh*, 8 Wheat, 543; *Fletcher v. Peck*, 6 Cranch, 87; *Holden v. Joy*, 17 Wall, 211; *Beecher v. Wetherly*, 95 U. S., 517.)
